Market Reports.

The Markets.

SAN FRANCISCO, Feb. 18, 1897.

Owing to continued unsettled weather, business has been slow, yet the volume of goods sent out the past week shows an increase over the present week. It is the consensus of opinion that we will enjoy a larger and more healthy trade this year than for over half a decade past. This opinion seems to be well grounded and based on the established fact that present prospects point to this year being the banner year for big crops of all kinds. The moisture in the ground extends deeper than for over six years, which insures a good supply for crops at the most trying time; the acreage seeded to wheat shows a large increase, as does the acreage devoted to nearly all kinds of farm products, while there will be a large increase in the numer of fruit-bearing trees. This will call for a largely increased number of hands, which means better times for wage-earners. Turning to the gold mining industry, all indications point to the boom not only continuing, but enlarging. More mills will be running, many of the older ones have been enlarged, many new mines will be bullion producers, a large number of the older ones will increase their output, while exploiting of new properties will be more active, as will prospecting for new gold finds. The above means an increased call for mining machinery, which ought to cause iron workers to run full-handed and on full time.

The local money market is dull with no call outside of bullion and gold coin for remitting to the East. The demand from this source caused the premium on eastern exchange to advance to such figures as to make it now profitable to buy or borrow gold bullion and coin for sending forward by rail than to buy exchange. Referring to this movement our New York correspondent writes: "The arrivals of gold from San Francisco are due to the fact that there is a great scarcity of New York exchange and currency on the Pacific coast just now so that the only way to send money East is in the form of gold. This movement is quite usual at this time of the year and not of itself at all significant. A number of reasons exist for it, of which one is the fact that business is very dull on the Pacific coast and there is very little employment for credit in that section. The effect is likely to be a further increase in the visible stocks of gold, which are now larger than they have been at any time since the currency trouble became acute in 1893. Further arrivals of gold from San Francisco are likely before long."

Our correspondent, it is quite evident, is not properly advised. While the call here is slow and will continue to be until after the first week in March yet the heavy shipments hence are to avoid paying taxes and also to make payments for considerable of the gold secured last year from New York when it was found that a run on the banks might be started any day.

New York Silver Prices.

NEW YORK, Feb. 18.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29¾	64¾
Saturday	29¾	64¾
Monday	29 11-16	64¾
Tuesday	29 11-16	64⅝
Wednesday	29 11-16	64⅝
Thursday	29 11-16	64⅝

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 25	10 25@12 50	13 45
Saturday	11 90	3 25	10 25@12 50	13 45
Monday	11 85	3 25	10 25@12 25	13 35
Tuesday	11 90	3 25	10 25@12 50	13 35
Wednesday	12 00	3 25	10 25@12 50	13 40
Thursday	12 00	3 30	10 25@12 50	13 45

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	25c Prem
New York Telegraphic Transfer	27½c Prem
London Bankers' 60 days	$4.86½
London Merchants	$4.85
London Sight Bankers	$4.88½
Refined Silver, peroz., 1000 fine	64⅝
Mexican Dollars	51½@52

SILVER.—The market settled back a point in London and also at the East towards the close of the week. According to London cables the market in that city must be quite sensitive, for with the least improvement in the inquiry from India or elsewhere the price strengthens. There have been more India Council bills put on the English market, which has met to a large extent exchange requirements, thereby operating against the demand from that quarter for the white metal. New York mail advices continue to note free shipments of silver bullion, but notwithstanding this prices abroad do not shade off much or get below 29 11-16d in London.

The last steamer hence for the Orient took out for Japan silver bullion valued at $65,000, and to Hong Kong $236,500. This is quite an increase in the shipments.

MEXICAN DOLLARS.—The market has held to fairly steady prices. The China steamer took out the past week 361,385. The next outgoing steamer will also take out considerable.

COPPER.—The market eased off at New York and then strengthened, closing fairly steady. The decline was due to foreign business holding off. Our New York correspondent, writing on the subject, says: The movement of ingot in the form of deliveries on old contracts continues heavy and, to all accounts, a large portion of the current output of producers is absorbed. Hence the offerings for prompt shipment are unusually light and prices are held quite firmly. New business continues rather slow, however, since no inducements are being made to large buyers, while the general belief that there will be copper enough to go around in the near future apparently restrains excessive buying. Sellers' prices remain at 12c for Lake Superior ingot, 11¾c for electrolytic and 11½@11¾c for casting stock.

The local market is quoted as follows:

Ingot, jobbing	14¼@—
Ingot, wholesale	—@13¼
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

QUICKSILVER.—There is no particular change in the general situation. The offerings from outside sources have been about all absorbed, which gives the market a steadier and firmer tone. New York mail advices state that the market there and in London is firmer. Under date of February 15 the New York market is reported as follows: Quicksilver price for lots of 100 flasks has advanced sharply, and is now quoted at $38 per flask. The rise is understood to be due to an advance in the foreign market. Jobbing prices are consequently firmer at 52@53c, and the indications suggest an advance ere long on mercurial preparations.

BORAX.—There is a continued free movement Eastward, where the demand appears to be improving.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

LEAD.—At the East and in England this metal continues the attractive feature for futures. The dealings have been quite heavy for both cash and future delivery. The improvement in prices, it is said, has been largely based on legitimate trade wants. The *Oil, Paint and Drug Reporter* of New York says: "The smelting of Mexican as well as British ores in bond here and the exportation of the lead product has an advantage of something like $10 per ton over the withdrawal of the product for consumption here, and it requires no other stimulus than this additional product to induce smelters to take advantage of the foreign outlet to the fullest possible extent. The only effect of the action of the Colorado smelters is to open up an outlet for more of the British lead than could be consumed here and to render it in a higher degree independent of the American consumers."

Our market is quoted in jobbing lots as follows:

Pig	3 75	@	3 85
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a stronger tone to the market.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—Plates are irregular, with a good inquiry ruling for American. Pig has fluctuated slightly. The East reports a sensitive market, with a strong upward tendency.

We quote as follows:

Pig, per lb	14½c@ —
Plate, I C coke, heavy, per box	$4 05@ —
" " light, "	3 95@ —

IRON.—The markets at the East have shaded off, closing weak. This decline in the face of heavy purchases of steel rails by railroad companies indicates a strong competitive selling fight on between producers East.

The New York *Journal of Commerce* just to hand says: It was learned on very good authority that the orders for steel rails placed since the break in prices involve a total of 500,000 to 600,000 tons. Of this amount Eastern manufacturers captured 150,000 to 200,000 tons, the Illinois Steel company probably 300,000 tons, and other manufacturers the balance. As the reports go, the Carnegie interest was considerably behind in the procession, and finally cut prices to the basis of $16 f. o. b. at their mill to avoid losing more orders. This the interest in question does not admit, but it is an open trade secret that Western orders were taken at $16@17. Eastern mills and the Illinois Company, it is understood, now have enough business in hand to keep their works in operation for six months or more.

Our New York correspondent writes: "It is believed that the first step by the Carnegie-Rockefeller combination will be to make heavy sales of iron ore for delivery during the coming season without regard to the pool. This will probably cause a war on prices by all the iron mining companies of northern Michigan and Minnesota. In the previous years the production of every important mine in the Lake Superior region has been allotted and prices fixed before this time, but this year nothing has been accomplished with reference to an agreement. President Bacon, of the Minnesota Iron Company, says there has been no agreement thus far for 1897. Two tons of iron ore can be mined in the Lake Superior region for every one that can be sold, and over two tons of steel rails can be made for every one used by the roads. This unlimited capacity will give boundless opportunities for warfare. Either of the great companies of the Mesaba range can flood the ore market."

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00		$23 00
Gartsherrie	21 50		23 00

COAL.—The market is practically unchanged. The demand holds good. The supply of foreign on spot and to arrive is only fair. Imports of domestic are fairly few.

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market shows slightly more animation but at unchanged prices. At the East mail advices reported a little more doing.

Our market is quoted at 7⅛@8c in a jobbing way. New York mail advices quote 7¼c for Cookson's, 6½@6⅝c for Hallett's and 6¼c for Japanese.

LUMBER.—There is an improving export movement from this port and up north.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is below the cost of production.

Wire, carloads, basis per keg			
" jobbing, " "			$2 20
Cut, carloads, " "			
" jobbing, " "			2 00

POWDER.—The demand is improving. The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

SPELTER.—Our market is active and firm at 5 cents a pound in a jobbing way. The New York market is reported devoid of new interest. For large parcels $4.05 to $4.15 per 100 pounds is quoted—jobbing higher. English cables report a quiet market at the late shading in prices.

NICKEL ANODES.—There is a light call reported, with the market quoted at 60 to 65 cents per pound.

PLATINUM.—The market is fairly steady at $10 to $15 per ounce.

ZINC.—There is a fairly good movement. Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is reported fairly steady under a light call.

We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—A fair demand is reported in our market at $1.50 per pound in a jobbing way.

PHOSPHORUS.—The market is steady to firm.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

Jobbers report that, while general trade is quiet now, the outlook is quite promising for a fairly free movement during the spring months.

CAUSTIC SODA, 60%.—The market is reported quiet but steady at 3¼c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but firm at $1.70 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—The New York market is strong at $1.92½ per 100 pounds, owing to the fact that no stock is obtainable there except from store. The advices from Chili are to the effect that the combination will restrict the output and keep values at around $3.92½ per 100 lbs for 95%. Our market is quoted from store at 4 cents per 100 lbs for 95%.

ACETIC ACID.—Eastern advices do not report any change. Our market is fairly steady. We quote in a jobbing way at 6@12c per lb in carboys, according to make.

NITRIC ACID.—The market is steady from 6½c per lb in carboys.

SULPHURIC ACID.—The demand is light. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—The East reports the market in good position. With us the market is fairly firm. We quote in a jobbing way at 4¼c per lb.

Mining Share Market.

SAN FRANCISCO, Feb. 18, 1897.

The market for mining shares the past week has been manipulated downwards by a master hand. It would seem as if the same person has been at the helm for some time past and has the gift to attract outsiders to a certain mine, while working its shares to get the entire list lower, so as to freeze out holders at low prices. The moving of Con. Virginia up $1 a share and causing the rest of the list to sympathize only slightly, and then at each break cause the other shares to go down proportionately, but at the rallies in the former the others rallied only slightly. By working it in this way, everything sells lower than before the Con. Virginia advance, while the outside public has considerably less shares—sold out by brokers, or else by themselves, for fear of assessments and much lower prices. At this writing it looks as if there will soon be another up-move in the market, but what will take the lead it is hard to say. The action of the market indicates that the insiders are after shares, and, if so, they will get what is wanted, if they keep prices down for months to come. Interest centers on the work in Con. Virginia, but, from all we can learn, the position taken in this department regarding it is thoroughly correct. Rumors begin to circulate of an improvement in Chollar on the Brunswick lode, 500-foot level. On this level they are running a south drift, but from all that can be learned, we think it was not the object to strike the downward continuation of the ore until the drift had been well advanced, and, perhaps not then, until after connection was made with the levels above. If the ore vein on this level is found to be wider and the grade does not show any falling

Gold Mines CRIPPLE CREEK Gold Stocks
At present prices are a sure profit. Write us for prospectus and information regarding mines, producing and prospective producers. We have collected a list of properties that will interest you. Write us at once.
HOPKINS & JEWELL, P. O. Box 1201,
CRIPPLE CREEK, COLORADO.

Well Known Copper Mine
FOR SALE.
Mine well developed. Complete working plant. Situation and facilities first class. Address H. D. RANLETT, Ranlett, Amador County, Cal.

off, then the company will be able to develop a good property. It is rumored that in Ophir an improvement is coming in, but the price for shares does not show it if there is. With the coming of D. O. Mills to this coast the price of the Gold Hill shares go down. This has never failed, and why it is so no one seems to know, although they do considerable guessing. The Standard Con. Company of Bodie has declared a 10-cent dividend, payable March 23. The Bodie, Mono and Bulwer companies have disincorporated and have no longer a legal existence, the Standard Company having absorbed them.

There is a report current that George W. Grayson will contest for the control of Hale & Norcross, and that Col. Alvinza Hayward will support him. If there is a contest it is not of much moment, or else one of the contesting parties, feeling assured of success, does not compete for shares. If Mr. Grayson should get control of Hale & Norcross it is to be hoped that he will manage it better than the Bullion. This mine ought to be a bullion producer and not an assessment producer. It is said that to the west, in what is known as the old Crœsus ground, there is very rich gold-bearing ore that can be extracted and the mine made to pay dividends. The Fox suit against the old management of Hale & Norcross will not come up in the Supreme Court before July next.

From the Comstock mines the news is far from an exciting character, and none is looked for until the insiders have frozen about everybody out of their holdings. The work from one end of the lode to the other is being done in a way not calculated to strike a rich body of ore. In Utah they are running an east crossdrift in the old west surface tunnel workings. In Sierra Nevada they are still at work on the 900-foot level and also Layton tunnel level. On the 900-foot level in Union they are pushing, but slowly, three east crossdrifts. The formation in them was, at last advices, clay and porphyry. In Mexican, on the 1000-foot level, the west crossdrift is in over 255 feet, with the face in porphyry, showing clay separation. At last advices there was a slight seepage of water. This latter is accepted as a good sign, but it is not at all likely it will be taken advantage of and work prosecuted farther west so as to strike the lode. It is more certain that work will be stopped or else turned before many days. From Ophir official advices do not report anything of consequence doing in the Central tunnel level. The west crossdrift on the 1000-foot level is in over 390 feet. At last advices the face was in soft porphyry, seams of clay and lines of low-grade quartz. Connection has been made in Con. Virginia between the 1650-foot and 1550-foot levels, but the expected boom in shares did not materialize. Instead of prices going up they went down. When they have the small vein better developed for working, enough good to high-grade ore ought to be taken out to nearly pay expenses. There is no change in the workings on the 1750-foot level. On the 1000-foot level a south drift is being run from No. 2 west crossdrift.

They are running an east crossdrift on the 175-foot level in Andes. The Best & Belcher and Gould & Curry east crossdrift from the 800-foot Bonner shaft level has been extended a total distance of over 390 feet without having found anything of greater value than porphyry. The work reported in Savage is practically unchanged. They are still repairing the shaft in Hale & Norcross. They are raising ore from the 900-foot level. From the tenth floor above this level they have started an east crossdrift. No work is reported in Chollar. The south drift in Potosi ran from the raise connection on the tunnel level is out over 110 feet. At last advices it was chiefly in quartz giving assays of $5 to $12 a ton. They are still extending the north drift in Bullion. They continue, so it is said, to fool away time and spend money by playing work on the 500-foot level. The joint Confidence, Challenge and Con. Imperial west crossdrift has been extended the usual few feet. At the rate it is being "pushed," it will strike the west lode about April next. No advices have been received of work in Challenge. In Confidence there is nothing new to report. The same remarks apply to Yellow Jacket. In Crown Point work is confined largely to the levels heretofore reported. Belcher and Seg. Belcher's official letters for the public do not report from what level they are taking out ore or anything regarding the work; but, it is said, that private letters do give the information and they also state that quite a body of ore has been developed. Of the correctness of these reports the writer knows nothing, but from the fact that official letters do not give particulars as to the work it looks as if they are correct. Overman continues to raise a few tons of ore. Advices from the 1100-foot level workings in Caledonia are highly encouraging, but no one seems to have any more faith in the management of this mine than of some of the others, and therefore favorable news counts for nothing with them. From Alta the news is essentially unchanged.

From the Brunswick lode nothing of interest has come to hand. In Occidental they are running an east crossdrift on the 550-foot level. On the 750-foot level and 850-foot level they are running south drifts. The formation on the 850-foot level was quite favorable at last advices. In Chollar interest begins to center on the south drift on the 500-foot level. At last advices they were in over 110 feet, with the formation softer and quite favorable. On the 400-foot level they are running a south drift and also upraising. The latter was in $20 to $25 ore 5 feet in width. No change is reported in the work on the 200-foot and 300-foot levels. From the January cleanup they got $7867 in gold, and silver bars valued at $1683. They are shipping ore to the mill on February account. The work that is being done by Best & Belcher, Gould & Curry and Con. Virginia on the 300-foot level is an east crossdrift and a south drift. Both, at last advices, were in quartz. They have resumed sinking the shaft.

The following illustrates the changes of the week:

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

THE OVERLAND LIMITED,
VIA
UNION PACIFIC.
Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Pluta, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado, send to

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of January, 1897, an assessment (No 5) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 8th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS PEACH, Secretary.

Office—237 12th street, San Francisco, California. Office hours from 4 to 6 o'clock P. M.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. PREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1897, an assessment (No. 61) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 23d day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room No. 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 43) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

AND PACIFIC ELECTRICAL REVIEW.

No. 1912.—VOLUME LXXIV. Number 9. SAN FRANCISCO, SATURDAY, FEBRUARY 27, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Miner's Inch.

There has been introduced in the California Assembly, and favorably reported upon by the Committee on Mines and Mining Interests, a bill "legally defining what a miner's inch shall consist of." It is a remarkable bill, worth quoting, and is as follows:

"For a uniform system of measuring water when the term 'miner's inch' is used, it is hereby declared that a 'miner's inch' of water shall be such a quantity as flows from an orifice one inch square through a two-inch plank, with still water standing at a depth of six inches above the top of the orifice, such a discharge to be not less than one and one-half cubic feet per minute, equal to twelve gallons."

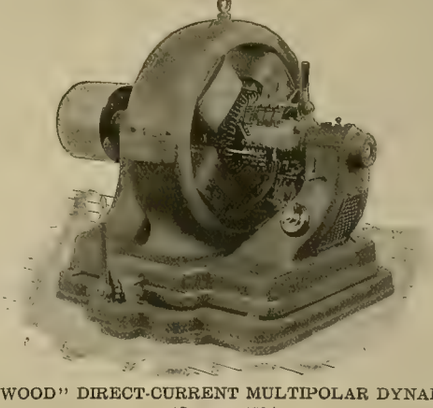
It will be observed that this bill prescribes that a "miner's inch" shall be equal to a flow of not less than one and one-half cubic feet of water per minute, "*equal to twelve gallons.*" Does the author propose to change the measures now in use in this country? According to all the accepted authorities, and as most school boys know, one cubic foot of water is equal to about 7.48 gallons—or, to be more exact, it is equal to 7.4805 gallons. Upon this basis one and one-half cubic feet of water would equal 11.22075 gallons. The standard American gallon, or old English "wine" gallon, contains 231 cubic inches.

That there is need for a statute providing a standard for the value of a miners' inch there should be no question. By choosing a flow of one and one-half cubic feet per second we shall have one that would be satisfactory, which cannot be misunderstood and which will be a basis for easy calculation, for in this case 40 miner's inches would equal a flow of one cubic foot per second, the terms in which hydraulic engineers make their calculations. It will be in the power, then, of any farmer or miner purchasing small quantities of water by the inch to obtain a box of given dimensions, and by noting the time of the flow very easily determine the amount of water he is getting.

For the State to prescribe through what orifice and under what conditions the water must flow is a piece of supererogation as valueless as it would be to lay down the shape of vessels by which gallons must be measured. The conditions of the case must determine how the water shall be measured. What is wanted is a standard for the quantity only.

Colorado and other States have by legislative enactment laid down the amount of water in cubic feet per minute or second that shall equal the miner's inch. In this State there are many different miner's inches, owing to the many different ways of measuring. On this subject A. J. Bowie, in his treatise on "Hydraulic Mining," says: "The miner's inch of water is a quantity which varies in almost every district in California; no one gauge has been uniformly adopted, nor has any established pressure been agreed upon under which the water shall be measured. * * * The apertures through which the water is measured are generally rectangular, but vary greatly in width and length, being from 1 to 12 inches wide, and from a few inches to several feet long. The discharges are through 1-inch, 1½-inch, 2-inch and 3-inch planks, with square, or with square and chamfered edges combined, or not, as the case may be." The Smartsville inch equals, according to Bowie, 1.76 gallons per minute, the Park Canal and Mining Company's inch in El Dorado was 1.39 gallons per minute, and experiments made by Hamilton Smith in 1874 through a rectangular slit, 50 inches long, 2 inches wide, through a 3-inch plank chamfered, the outer inch under 7-inch pressure above the center of the opening, showed an inch to be equal to 1.57 cubic feet per minute. Experiments made by A. J. Bowie have shown that an aperture 12 inches high by 12¾ inches wide, through a 1½-inch plank, with a head of 6 inches above the top of the opening, will discharge 200 miner's inches, each equal to 1.4994 cubic feet per minute.

This *module* has been adopted rather generally for measuring large amounts of water and for that purpose is very convenient, while it would be useless for measuring smaller quantities. So the aperture named in the proposed bill would be of no use except for measuring very small quantities. If the Legislature will state the flow per minute that shall equal a miner's inch, it will have done its duty.



DITCH CONSTRUCTION IN IDAHO.—(*See page 172.*)

San Francisco, February 27, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Ditch Construction in Idaho; "Wood" Direct-Current Multipolar Dynamo, 169. Flume and Trestle; Cross Section of Ditch, 172.
EDITORIAL.—The Miner's Inch, 169. Americans in British Columbia; The Prospector's Flight Northward; Mr. Bowie's Article; Foreign Capital, 170.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 174-5.
SCIENTIFIC PROGRESS.—Formation of Clouds; Thorium and Its Oxide Thoria; Silichromite, 176.
ELECTRICAL PROGRESS.—"Wood" Direct-Current Multipolar Dynamo; New X-Ray Phenomena; Electrical War Devices; The Place of Electricity in the Chemical Industries; Electric Railways in the United States; Cost of the Niagara Falls Electric Power, 176.
MECHANICAL PROGRESS.—Figuring the Capacity of Boilers; Water Scoops for Railways, 176. The Mammoth Globe at the Paris Exposition; Tribute to Machine Tools Made in the United States, 177.
PRACTICAL INFORMATION.—Olive Green Squadron; Abandonment of a Social Experiment; A Late Device; Danger in Eating the Flesh of Poisoned Animals; The Longest Suspended Wire in the World; Prehistoric Monuments of France, England and Germany, 177.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 186-7.
MISCELLANEOUS.—Concentrates, 171. Ditch Construction in Idaho, 172-3. Outline of the Geology of California with Reference to Its Mineral Deposits, 173. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Commercial Paragraphs; Recent California Mining Incorporations, 179. The Tutthill Water Wheel. 181.

The Government and Mining.

In early days in California, Australia and other regions where gravel mining was being done, it was a very common thing to see miners desert or pass over good claims to go on in search of "the place where the gold came from." In those days there were few trained geologists, and none who had investigated the subject of gravel deposits so as to be able to tell the miners that any search for a "mother lode," or anything of that sort, where almost pure gold could be dug out, was useless. The impression prevailed that the gold came from an almost pure source, and was later scattered through the gravels.

Doubtless more labor and money were lost in these wild and fruitless searches than in what would now be considered good mining. The men engaged in the industry had had no previous experience and could not learn from the experience of predecessors. Had the Federal Government properly appreciated the value of mining to the country, and made a slight effort to render assistance, it would have made a better investment than it ever has in any other way. To-day but little aid from the Government is received and millions are being lost yearly for want of it.

This can easily be seen by contrasting the work done for the mining industry in British Columbia by the Canadian Government with the attitude of the United States Government to the mining industry. The fostering care of that more paternal Government has developed in a little over two years one of the richest gold-producing fields in the world. Yet had no more been done than is done by the United States Government for new or old mining districts, British Columbia would not now be making such a stir in the world.

On the Yukon river, at the Clondyke placers, the miners—American citizens as well as British subjects—are rejoicing over a report that their mines have been found to be on the Canadian side of the line. There is no country in the world that has derived more benefit from the mining industry than the United States, and no government makes less effort for its development.

The geological survey of the United States is at present under the direction of a man who appreciates the value of the work that can be done to aid mining, but is hampered for want of means. Less than half a million dollars a year is spent and much of that, perforce, is spent in purely scientific work. It is to be hoped that Congress will soon be impressed with the idea that no money spent can bring larger returns, nor add more to the wealth of the country, than upon the economic work of the geological survey.

The Prospector's Flight Northward.

Now again is coming the season when the prospector takes his flight northward. A few months ago he was driven out of Alaska and from the mountains of British Columbia, Washington, Idaho and northern Oregon, when the snow fell, and made his way to the more congenial winter climates from southern Oregon to Mexico.

As much as all the West from the Black Hills to Vancouver Island, Colorado and New Mexico to California and from Alaska to Mexico has been gone over by prospectors these many years, there are being made more discoveries than ever before of mines that will be of lasting value and of new districts that will attract the world's attention. The prospector of to-day in spirit and character is much like the prospector of years ago, but he knows more and the results of his better work is shown in the continuous reports of strikes being made all over the western side of the continent. What is most significant is the fact that a very large proportion of these are made in districts that have been gone over by the prospector time and again for the past quarter of a century or more. The Fraser river excitement took thousands from California in the fifties only to be disappointed. Now with modern methods the mines promise to yield large returns and are attracting the attention of capital.

In the Black Hills rich mines are being found in rock that was passed over because it was not like that of the first discoveries. In Wyoming thousands of acres of placer are being exploited and hundreds of thousands of dollars is being spent in water ditches. Yet Wyoming has never been known as a gold mining State. In Nevada the same story is being told. In New Mexico and Arizona the demand for copper has been the cause of prospecting for ore bodies carrying that metal, with the result that enough promising discoveries have been made to greatly add to the wealth of those Territories. So in Montana, Idaho, Colorado, Alaska and other parts of British Columbia, new districts, new mines and unexpected formations carrying valuable minerals are being constantly discovered by the prospector.

Yet, for all he is doing, he receives little reward and little credit. Capital comes in, helps him out with a "grub stake" and enables him to go on again like the Wandering Jew and the capitalist goes to the Senate or Europe.

Mr. Bowie's Article.

On page 172 will be found an article by Aug. J. Bowie on ditch construction in Idaho, in which he gives the data gathered in his experience there in 1895 and 1896. But for the work done by Mr. Bowie in writing his "Treatise on Hydraulic Mining," much of value that was learned in California in developing that industry would have been lost to the world with the partial cessation of hydraulic mining about fifteen years ago. Many of the best engineers do not publish the results of their observation and experience for the benefit of others. The work that Mr. Bowie has done in this way never brought him any return pecuniarily, but has been of inestimable value to others. It must, however, be a source of satisfaction to him to have learned that unselfish work brings great rewards in the way of satisfaction for doing a public good.

Ditches and canals have been dug from the earliest days of recorded history, yet since the beginning of hydraulic mining in California more has been learned of the conveyance of water than in all the preceding time. An example of the progress in ditch and flume construction is shown in some of the newer methods adopted in the construction of the ditch referred to in Mr. Bowie's article. It is timely, because now more than ever is there an activity in gravel mining in all parts of the world where there are auriferous gravels. In Wyoming, Colorado, Idaho, Montana, Nevada and British Columbia there are many large areas of auriferous gravels that are being opened up, and ditches from two or three to nearly one hundred miles in length are being constructed. In Siberia and Russia it is predicted that within a few years great store of gold will be taken from the gravels. In New Zealand and Australia and South America capitalists are taking hold of large deposits and bringing in water at considerable expense.

The promoters of all these enterprises turn to California for examples, and many of them are sending to California for engineers or practical hydraulic miners to assist in the work.

Foreign Capital.

It is fortunate that American mines are not in favor in London among those who take hold of properties for the sake of promotion fees and do not care what the result of the working of the mines shall be. As a consequence, those gentlemen who are given altogether too much to over-capitalizing go to other fields for bait for their prey, and there is very little heard nowadays of scandals on the London market in connection with mines located in the United States.

The reason for this is probably the fact that information in regard to nearly all the districts in this country is easily obtainable, and that it is difficult to float a mine upon a prospectus that does not state facts. It may be said that there is a disadvantage to us in this, in that it prevents the coming here of a great deal of capital; but, in answer to that, it can be said that it is much better for us that no capital shall be brought here or sent here at all unless it comes for the exploiting of legitimate enterprises.

During the past year or two a great deal of money has gone into Western Australia from London, and a large part of it into enterprises that will never return interest on the investment—much less the principal. It has been easy for the harpies on the London market, known as promoters, to carry out these schemes, because Western Australia is so new, and there is so little business connection between it and London that it is easy to present propositions without fear that the investors or others can obtain reliable information and expose them if they are not genuine.

In the colony of Victoria, where legitimate mining has been conducted for many years, the promoters find few properties to place on the London market; yet Victoria is not in want of capital, and can obtain all that is necessary without any blowing of trumpets for legitimate enterprises.

So it is with the United States. During the past year at least $50,000,000 has been invested quietly by English capitalists in this country, and the chances are that during the coming year much more will come in. Instead of sending out foreign engineers, they have employed Americans, well acquainted with the districts in which the proposed investments were to be made, and with the local conditions.

Americans in British Columbia.

The bill passed by Congress providing for restrictions on foreign immigration, with a clause prohibiting Canadians from coming over the line temporarily to work, is apt to cause some retaliatory legislation in British Columbia, unless the cooler heads interfere. At a meeting of American citizens at Rossland last week resolutions were sent to President Cleveland, protesting against the bill and asking him to veto it. They stated that there were 25,000 American citizens in British Columbia and many were heavily interested in the mining industry there.

At the regular meeting of the executive committee of the Northwest Mining Association last week resolutions were passed asking that the Mayors of various cities call mass meetings to pass resolutions urging legislation, both National and State, that will best serve to cement the friendly relations between the peoples on both sides of the line.

Altogether it looks as if the British Columbians will not act hastily in the matter, and, judging by the editorials published in their papers, they are more than desirous of doing all they can to continue the friendly relations that at present exist. One of them says:

If the Americans were preying upon Canada and carrying all their wealth over the border, the Canadian government would well occupy its time in seeking a remedy for such a great evil, but it is American capital that is assisting to develop Canada's resources; it is American brains that is building up her cities and American energy that is vitalizing her business enterprises. A great many of the Americans who are working in Canada are Canadians in all but name.

Concentrates.

A LARGE vein of copper ore is reported to have been discovered near Waldo, southern Oregon.

THE Goodwill tunnel at Cripple Creek, Colo., is being run at the rate of a little over 10 feet a day.

HURST & FOWLER propose to erect a 10-stamp mill on their mine at Harrison gulch, Shasta county.

A COMPANY has been organized in Paris, with a capital stock of $3,000,000, to develop the oil fields of Peru.

A NEW mining district, to be known as the O'Brien, has been formed in Secret Canyon, Kern county, Cal.

J. S. WILBUR and W. S. Peakes have arranged for the purchase of the Mammoth mine in Mariposa county, Cal.

D. LIGHTNER is preparing to erect a quartz mill in the Rodemacher mining district, twenty miles northwest of Garlock, Cal.

SALT LAKE capitalists are negotiating for the purchase of the onyx deposits recently discovered on the Brumeau, north of Elko, Nevada.

THE new railroad between Robson and Trail, in British Columbia, is being rapidly built, and is expected to run trains by the first of July.

THE French syndicate has concluded its purchase of 300,000 shares of the Elkton Consolidated mine at Cripple Creek, Colo., at $1 per share.

THE Rand Central Electric Works at Johannesburg, South Africa, with a capacity of 2000-horse power, supplies this power at the rate of about $220 per annum.

A NUMBER of men are employed developing a coal mine in Crum canyon, near Battle Mountain, Nevada. The vein shows 3 feet of coal, which is said to be of excellent quality.

THE Black Abro mine, at Dumont, was sold last week at Idaho Springs, Colorado, by W. H. Price to M. E. Smith, representing Eastern capitalists, for a price approximating $200,000.

IN the Frisco mine, Idaho, Manager MacDonald gives to each man working in the shaft a bonus of $1 a foot if 60 feet is made a month. If more than 60 feet is made he pays $25 for each additional foot.

BELOW the Comstock mines, in Nevada, several placer claims have recently been made along the course of the Washoe, on Galena creek, below the Ophir, and several other abandoned mill sites.

SOME chemists have under consideration a plan to save the sulphur from the fumes of the Butte, Montana, smelters, and begin the manufacture of chemicals, in which sulphur forms the principal ingredient.

THOMAS WALSH and Harold Wilson have obtained bonds on the Evergreen and Mayflower mines at Bingham, Utah, and are negotiating for others. It is proposed to erect matting plants to work the low-grade ores at Bingham and Ophir.

A SALE was made a few days ago of 4,000,000 pounds of Lake Superior copper wire at 11¾ cents for export to Germany, where electric railways are rapidly extending. Copper for twenty-eight railways in England is being contracted for.

A CABLEGRAM has been received from London by the Le Roi Mining Company of Rossland, British Columbia, making an offer for the property at the rate of about $4,000,000, with an agreement to place in deposit $100,000 as a guarantee of good faith.

A BILL has been introduced in the Idaho Legislature, providing that two-fifths of the gross output of the mines shall be assessed and taxed as any other property. As all improvements of the mines are now taxed, this would virtually mean double taxation.

EVERY mining journal published everywhere in every mining State says: "There is no part of the world to-day that offers better inducements for the investment of money in mining than right here in ——." And the best of it is that they all furnish excellent reasons for the assertion.

IN a recent decision the Supreme Court of British Columbia holds that under the coal mines regulation act it is illegal to employ Chinamen in underground coal mining. An effort will be made at this session of Parliament to pass a law extending the same rule to all classes of underground mining.

THE St. Elmo Mining and Water Company, who own the St. Elmo mine in the Randsburg district, Kern county, California, propose to sink a shaft 500 feet deep on the property. Nothing will do more for the whole district than the sinking a few deep shafts to determine the value of the mines in depth.

THE great depth to which mines in Victoria, Australia, have been worked says much for the future of mining in that colony. In the Lazarus a shaft is down 3185 feet; in the New Chum United, 2892 feet; New Chum Consolidated, 3099 feet; Garibaldi, 2720 feet; Shamrock, 2764 feet—and so on through a long list.

IN January the copper product of the United States was about 39,500,000 pounds, the same amount as was produced in December, while foreign mines produced only 14,784,000 pounds, a decrease of 2,664,000 pounds. It is no wonder, then, that foreign capitalists are so eagerly seeking copper deposits in this country.

THE London *Mining Journal* gives a list of quartz and gravel mines of Victoria, Australia, fifty in number which have paid in dividends over £20,000,000, most of them are yet in operation. Taking the total product of Victorian mines at £250,000,000 it is estimated that there has been paid in dividends from this no less than £80,000,000.

THE State of Nevada has received in grants from the United States Government 2,455,860 acres of land, and there is yet due from the same source 277,212 acres. Of this 90,000 is an agricultural college grant, and 46,080 a university grant. Of the lands granted a large acreage has been turned over by the State for the establishment of a mining college.

THE Surveyor-General of Nevada, in his annual report, speaking of the question whether Nevada is not a gold rather than silver-producing State, says that the increase in production of gold and silver combined in 1896 over 1895 was $1,121,499. This was all due to the increase in gold production, for the silver production fell off from $1,051,992 in 1895 to $988,555 in 1896.

THE United States Debris Commission has granted permits to hydraulic to A. F. Roberts, of Forbestown, Butte county, Cal.; to Gray & Taylor, for the Sugar Loaf mine, near Colfax, Cal. The owners of the Tippecanoe mine, near Camptonville, Yuba county, Cal., and the owners of the Kentucky Slab mine, in El Dorado county, Cal., have been authorized to reopen their mines.

THERE are some marvelous growths recorded in this part of the world, but probably the most remarkable of late is the growth of a tale in traveling from Costa Rica to Wyoming. When it reached Laramie it was to the effect that one McGregor had discovered a ledge in the Central American republic with gold quartz that assayed $240,000 to the ton, or about 60 per cent gold.

PROSPECTING with plows is the latest innovation in mining, and was introduced a few days ago by Whelpley and Mamby, in what is known as the "Stringer" district, near Randsburg, Cal. They used a large plow with eight horses, and plowed furrows across their ground. The soil is a decomposed granite, and by crossing two or three times in each place were enabled to uncover several stringers.

HARRY JOHNSON, an extensive stock raiser in Lower California, has for the past three years been digging a ditch to convey water from half a dozen big springs on the slope of San Pedro Martir to extensive placer diggings at Socorro, a distance of eighteen miles. The placer ground is sixty miles east of Colnett and Mr. Johnson has a Government patent for thirty-two claims, or about eighty acres of ground.

THE mineral land bill is dead—done to death according to programme. This paper hoped to be able long before this to chronicle its success. Many columns were published herein in its favor, and considerable honest effort was made in behalf of the best interests of the commonwealth, which required the passage of so just a measure. Those who killed the bill should have their reward. They certainly earned it.

IT is reported from Ottawa, Canada, that the Government will probably pass a bill providing for the construction of the proposed Crow's Nest Pass Railway and its continuation as far as the coast. This, with the roads now built or arranged for, will do much toward developing the mining districts rapidly and bringing down the cost of working ores, so that much of a grade too low to be worked under present conditions may be handled.

WILLIAM SKEY, analyst to the Home Department of New Zealand, writes that he has found while engaged as an expert in a government case that aqueous solutions of cyanogen do not exert the least solvent action on gold or silver. Of course as the gas decomposes there is a slight solvent action, but even this is far too slow and destructive of the gas to make extraction of gold a commercial success. This must prove to be interesting to cyanide men.

HIRAM S. MAXIM, the great gun maker, has patented an improved process for extracting gold from refractory ores. He takes advantage of the affinity existing between gold and lead, when both are at a high temperature, and subjects the ore to the action of molten lead in the presence of a reducing gas or atmosphere. Whilst in the presence of a reducing gas or atmosphere the ore and molten lead are pounded, and the mass is slowly rotated or stirred.

IT is understood that the Exploration Company of London has closed a deal for the purchase of the Santa Rita copper mine near Silver City, New Mexico, for $1,500,000. The mine was largely owned by J. Parker Whitney of Boston, and was extensively worked during the Spanish occupation of the country, and the legends of the locality are to the effect that it was the deposit from which the ancient inhabitants used to secure the copper for their weapons.

AT the annual meeting of the Old Dominion Mining and Concentrating Company in Seattle, Washington, which has recently been incorporated for $5,000,000, G. B. Dennis, president of the Northwest Mining Association, was elected president. The company owns 53 claims in the Colville district, and probably has more development work done than any other company in the Northwest. The tunnel at the lower level is in over 3000 feet. At this meeting it was decided to push the tunnel another 2000 feet on the ledge.

THE output of the mines of Victoria, Australia, last year was about $15,000,000, as against about $5,500,000 for West Australia. Yet English capital is much more interested in the latter than in the former, and while but little money has been invested in Victoria by London people, during the past year immense sums have been paid out for development in West Australia. The reason for this is not that there is more faith on the part of the English promoter in West Australian mines, but that there is more room for speculation.

THERE is a bill before the Utah Legislature providing for a State Mine Inspector, and last week the Salt Lake *Tribune* published interviews with a number of the leading miners as to the bill. A large majority of them said that the value of the bill would depend entirely on whether a good man is appointed, and many of them expressed a fear that a mistake in this direction might be made. That is the trouble in all the States. Until all such appointments are made for merit, and not for political reasons, the passage of more such laws will be of questionable value.

AT a meeting of the shareholders of the Golden Feather, limited, held in London, it was decided to reconstruct the company in order to raise more capital to go on with the work in their mines in Butte county, California. It was stated that they had been deceived into working over old ground during the past season. The chairman stated that had they begun where they have now worked to this step would not have been necessary. During the past year 2000 feet of the river bed had been worked, and there remain in the claims about 5000 feet which is virgin ground.

DURING the past six months a number of companies have been organized by Eastern capital, largely to operate extensive gravel deposits in Wyoming and Northwestern Colorado. Last week at Rockdale, Wyoming, a company was formed to work 5000 acres of placer ground near that place. A contract has been let for the building of a ditch seven miles long, 12 feet wide at the top and 8 feet at the bottom, with a depth of 4 feet. Its cost is placed at $11,000. In this case, as with most of the ditching in that country, nearly all the work will be done with plows and scrapers.

IN Washington, on the Similkameen river, a novel method of mining gravel has been inaugurated. Last year there was built at Wenatchee a stern-wheel steamer, fitted up with the appliances, including pumps capable of handling 150 cubic yards of gravel per hour pumped from the bed of the river. The hose from these can take up a boulder 6½ inches in size from a depth of 50 feet to a height of over 20 feet above the water level. All of the material passes through a grizzly and the larger rock is thrown back, and that which passes through the grizzly is treated much as in ordinary sluice-box mining.

IT has been announced from Washington that the south half of the Colville reservation will be thrown open July 1. The Spokane papers are advocating the taking of steps to keep out the "sooners" in order that an equal chance be given to all. The *Spokesman-Review* says: "But it will be difficult to keep "sooners" off the forbidden ground until that date. In dealing with this problem the Government should either make a thorough effort to keep off the invaders, or no effort at all, leaving to all the opportunity to prospect the new ground and be prepared to make locations on July 1. Justice requires that all or none be excluded."

IN the case of Parsons vs. Mix, from Cripple Creek, Colo., the Secretary of the Interior has ruled that all advertisements for patent that do not give the book and page of the records in the clerk's and recorder's office at which the location or amended location certificate can be found, are defective, and all such must be republished. This it is claimed will make it necessary to advertise again all those claims which have been advertised in Cripple Creek during 1896. The trouble has grown out of the fact that the claim owners have made contracts at low rates with surveyors, who, to save money, also acted as attorneys.

THE importation of lead ores from British Columbia to American smelters is apt to cut some figure with the Committee on Ways and Means at the next session of Congress in framing a tariff. In case the increase proposed is insisted upon, although a majority of the mines are owned by people on this side of the line, it is claimed that they will do all their smelting in Canada. The great bodies of ore that are developed, the coal resources they have close at hand, and the different varieties of ore that are and will no doubt continue to be found, will make it impossible to do their own smelting and refining and have all the profits that accrue therefrom.

CORNISH tin mining must be in a bad way according to the Westminster (London) *Gazette*, which says that the depression in the mining districts of Cornwall has reached an acute stage. The price of tin has been gradually dropping for many months past, and it is now lower than it has been for nearly twenty years. Consequently miners are leaving the country in thousands. Since January last over 1000 miners from the districts of Camborne and Redruth alone have emigrated to South Africa and other colonies. In fact, Cornwall is fast losing the best of its brain and muscle. Last year no less than 2086 Cornishmen left the country for South Africa alone.

ON the Carson river, in Nevada, the tailings from the Comstock have been for some time receiving the attention of the Carson River Placer Mining and Dredging Company. The dredgers have worked satisfactorily enough, and the supply of material containing values in gold and silver is almost inexhaustible, but being composed of the tailings from over a hundred different mines are of a base and complicated nature, and it is no easy matter to decide upon a process for working them. Herman Davis of Dayton, Nevada, has begun the construction of a leaching plant of fifty tons capacity at that place, and the dredging company have an option for its purchase if satisfied with its work. About the first of March they will have made some changes in their machinery and begin screening material from their claims on the Carson river, to be worked in the leaching plant.

IT is reported that the Clondyke placers, on the Yukon, have been found to lie on the British side of the line, and that the miners, both American citizens and British subjects, hail this with delight. The Alaska *Searchlight* says: "For years the Yukon has been a large gold-producing region, but not one dollar has our Government expended in building trails or assisting miners in any way. All it has ever done has been to give these people Deputy Collectors of Internal Revenue and Customs, and a poor mail service one season. Now there is to be a radical change. The Canadian Government will doubtless pursue its wise and liberal policy, build trails, provide courts, etc. It is a lamentable fact, but nevertheless true, that the Yukoners, before another year has rolled around, will sing 'God Save the Queen' more heartily than ever they sang 'My Country, 'Tis of Thee.'"

IN 1880 the Government, under an act of Congress, reserved a number of large reservoir sites in the arid regions of the United States, and also reserved from settlement almost all the lands that could be irrigated from such reservoirs. The people of the West protested vigorously against the withdrawal of the lands from entry, and in 1890 Congress restored the lands to settlement and reserved only the reservoir sites. A bill passed last week by the House authorizes the State and private individuals or companies to use and occupy these sites for the purpose of storing water to be used for irrigation under such regulations as the respective States may prescribe. There has been reserved by the Government 138 reservoir sites, thirty-five of which are located in Colorado, twenty-three in California, thirty in Montana, nineteen in New Mexico and thirteen in Utah. This bill permits these sites to be used only for reservoir purposes, under the act of Congress of 1891, which provides that maps showing the contemplated improvement shall be filed in the Interior Department and approved by the Secretary of the Interior, and that the work of construction shall be commenced in good faith in one year and finished in five years.

THE American Institute of Mining Engineers held its seventy-second meeting in Chicago last week, E. G. Spilsbury presiding. Biographical sketches of Joseph D. Weeks and Alexander Tripple were read. Among the papers read were the following: "The Distribution of the Precious Metals and Impurities in Copper," by Edward Keller, Baltimore, Md.; "The Precipitation of Gold by Zinc Threads from Dilute and Foul Cyanide Solution," by Alfred James, Glasgow, Scotland; "Sorting Before Sizing," by R. H. Richards, Boston, Mass.; "The Chicago Drainage Canal," by J. F. Lewis, Chicago, Ill.; "Influence of the Metalloids (Sulphur, Phosphorus and Silicon) in Cast Iron," by Guy R. Johnson, Embreville, Tenn.; "The Genesis of Auriferous Lodes from a Chemical Point of View," by Prof. John R. Don, Dunedin, New Zealand; "Direct Generation of Electricity from Carbon," by R. H. Sanders and H. M. Chance, Philadelphia, Pa.; "Mining Methods in Northern Minnesota," by Prof. F. W. Denton, Minneapolis, Minn.; "Discussion of Prof. Christy's Paper on the Solution and Precipitation of the Cyanide of Gold," by Alfred James, Glasgow, Scotland; "The Hand Auger and Hand Drill in Prospecting Work," by Charles Catlett, Staunton, Va.

Ditch Construction in Idaho.

Written for the MINING AND SCIENTIFIC PRESS by AUGUSTUS J. BOWIE, Consulting Engineer.

Leesburg mining district, in Lemhi county, Idaho, has, since its discovery, been noted for the production of its gold placers. Situated in the heart of rugged mountains, until the last two years it has been practically inaccessible. The greatest part of this region is drained by Napias creek, which receives the waters from tributary creeks as well as from rains and melting snow from the surrounding mountains. These topographical conditions necessarily cause heavy floods during periods of warm weather and rain, when its discharge at California Bar has been as high as 700 cubic feet per second.

The California Bar claims are situated in Napias creek, about three miles south of the town of Leesburg, and below the principal tributaries of Napias creek.

In the fall of 1892 some Colorado speculators prospected these claims and in the spring of 1893 determined to hydraulic them. Early in the sixties attempts had been made to bottom this channel, and in one instance $60,000 was lost in endeavoring to reach it by means of a tunnel. Chinese subsequently leased the ground, and thinking that they could control the surplus water and drift the gravel, constructed along the west side of the creek bed a canal about two and one-half miles in length. The enterprise was a failure, but the property maintained its reputation for richness, although its opening was considered by all in these regions an impossible feat. An examination showed, however, that it was perfectly feasible, although the grade for the sluices was only 1.55 per cent.

The bar claims referred to approximate 4500 feet in length by 300 to 800 feet in width of the creek bed, contracting at the upper as well as at the lower end. Alluvions occur on the west side of it, but none on the east. The depth of the deposit in the creek bed demonstrated by prospecting shafts was 57 feet at the lowest end and 18 feet at the upper. The bedrock is a metamorphosed rhyolite. The creek bed has been tailed through for years and contains a large amount of sand and refuse material covering a gold-bearing gravel deposit which lies on bedrock.

The early miners ran a little ditch from Napias creek, above Rapp's creek, which delivered a few hundred inches of water at the lower end of the bar under a pressure of 100 feet. The ditch was practically of no value, and a larger one was therefore projected for hydraulic mining purposes. The new line was surveyed and located to draw the water directly from Napias creek, about a mile above Rapp's creek. Work was started in October, 1894, on the line, but extreme cold weather and snow closed the operations. In the latter part of May, 1895, instructions were given to push the work and complete it. Between 1894 and 1895 considerable information was gathered as to the discharge of this water-shed, and it had become very apparent that any ditch with its head in this portion of Napias creek would in all probability be destroyed in times of flood. Moreover, it was noticed that the flow of water from Rapp's creek was more desirable and as continuous as that from Napias creek, and, should there be only this one source of supply for both ditches, mining operations were liable to be indefinitely suspended during the water season. Rapp's creek was selected for the location of the head of the new ditch, necessitating a total change of plan and the construction of 3400 feet of flume and trestle work. On account of the steep rise of the hills, there are no available sites for storage reservoirs in the vicinity of California Bar.

A distributing reservoir can be constructed about a mile above the present head of the new ditch, which would impound a few weeks' water for mining during the dry season. The capacity of the new ditch and that of the old ditch (enlarged to carry 1500 inches of water), with the assistance of the China ditch to handle the surplus water, beyond the head of the sluices, will enable very extensive mining operations to be carried on during the entire water season, and, should developments justify it, a larger supply can be obtained.

Details and Cost of Construction of Rapp's Creek Ditch and Flume.—This work was constructed in the summer and fall of 1895 by the Leesburg Gold Mining and Milling Company, Limited, to supply water for the mining operations at California Bar, Lemhi county, Idaho. The line was surveyed in July, 1892, and staked in the fall of 1893. Preliminary work for the purpose of estimates was carried on spasmodically during 1893–4 up to May, 1895.

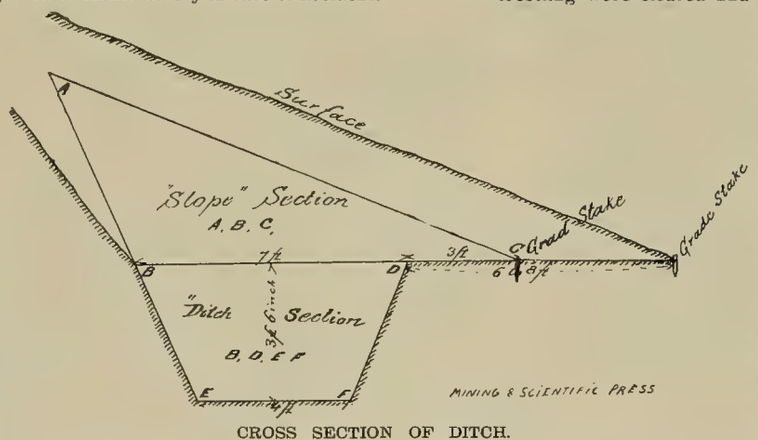
The following table shows the total expenditure from October 1st, 1894, to May 23rd, 1895 :

Labor clearing out stumps and grading	$1059.77
Team work	426.87
Powder, caps and fuse	41.87
Tools	12.35
Total	$1540.86

All this work was at the rate of $3 per diem for labor.

The ditch (see annexed drawing) is 7 feet wide on top, 4 feet on bottom, and 3½ feet deep. In its construction the bank was cut horizontally from the grade stakes a distance of from 13 to 15 feet. The outside bank of the ditch is 3 feet wide on top in solid ground. The side slopes along the mountain are exceedingly steep, and in places composed solely of debris, making ditching impossible. On all the curves the ditch is enlarged from 1 foot to 1½ feet in the bottom, with a corresponding increase on top. The material from the excavation was placed on the outer bank and sloped back to prevent any sliding into the ditch. After the ground is thoroughly soaked, caulked and consolidated, the carrying capacity of the ditch can be readily increased 1 foot in depth.

In the rock cuts, through a species of rhyolite, badly fissured, boxes have been placed wherever it was deemed necessary. In constructing the ditch, besides manual labor, teams with plows, go-devils and scrapers were employed. This is a new departure in mining work, but has been most successfully used even on the steepest side hill.



After the grade pegs were set, an outside stake 3 or 4 feet high was placed immediately opposite to them, so that the former could be readily found. The first furrow was started from 4 to 6 feet inside the grade peg. The ground was then graded for a width of 12 to 13 feet, according to circumstances, to a level with the top of the grade. In a word, a road was built by excavating the side hill on the grade of the ditch.

As each stretch of road was completed, a team with a plow was set to work about 4½ feet inside the grade peg, plowing the ground the top width of the ditch. A team with a go-devil with an adjustable side followed the plow, removing the ground broken. As the work progressed, the go-devils were abandoned and scrapers used. In their employment great care was necessitated in seeing that the outside bank remained intact and was not damaged by the teams. To insure against such accidents, where the teams entered and left the ditch the ground was gently sloped and left solid. The excavated material was taken out one end and deposited along the top and side of the outer bank, where it was tramped down by the teams as they returned to enter the ditch.

Teams were used to within a foot of the bottom of the ditch, from which point the ground was worked down with pick and shovel to grade, and the sides properly sloped. The grade of the ditch is 10.5 feet per mile.

Blasting as far as possible was avoided. The greater part of the work was done with picks, gads, sledges and crowbars. The outer bank has been kept practically intact, great care being taken not to have it shattered. The removal of heavy boulders was effected by means of powder (giant), but most carefully applied in very small quantities. The rhyolite rock through which the ditch runs, although compact, is somewhat disintegrated on the surface, but badly fissured. It was readily handled with the assistance of sledges and gads.

There are five waste ways, but two more are projected to insure safety in case of accident.

CROSS SECTION OF DITCH.

The dotted line shows a section of the ditch with the bank cut 10 feet horizontally from grade stake. Solid lines indicate the section as actually constructed with the bank 13 to 15 feet from the stakes and sloped back further than the dotted line figure. The area inclosed in the solid lines was used in calculating the number of cubic yards excavated, but no allowance has been made for the extra amount of ground removed in giving the inner bank its greater slope, as required in the general construction of the work.

The volume of earth removed was calculated from slopes taken every 50 feet along the line of the original survey.

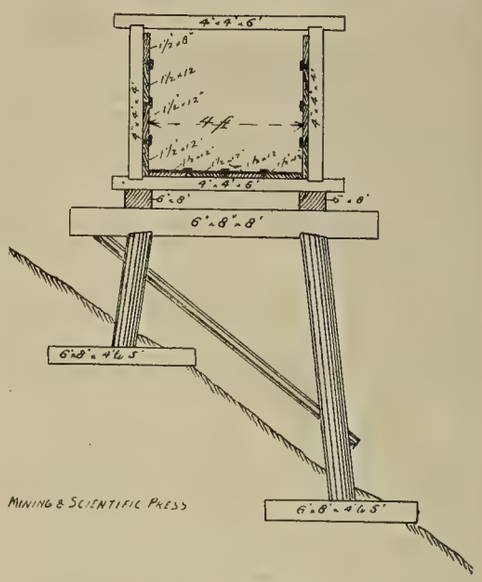
The total length of the line from the measuring box at California Bar to the head of the ditch at Rapp's creek is 15,105 feet, segregated as follows:

	Feet.
Ditching	11,633
Fluming	3,472
Total	15,105

	Cubic Yards.
Earth and solid ground removed	20,456.25
Rock removed	4,134.16
Rock removed for flume bled	552.27
Total	25,142.68

Of this there were :

	Cubic Yards.
In the ditch section	7,748.90
Slope section	16,841.51
Flume bed	552.27
Total	25,142.68



The total cost of the construction of the ditch, including labor, side-lining and ditch at head-gate was $10,309.86, segregated:

Labor and material	$ 9,448 28
Lining (materials, labor)	805 33
Head ditch	56 25
Total	$10,309 86

Exclusive of the ditch lining, but including the proportionate charge for superintendence, the cost of this work is as follows :

Labor, etc	$9,448 28
Superintendence	365 00
Total	$9,813 28

Trestle Work.—The timber for the trestle was hewn from spruce trees on the hillside above the line of construction. The character of the ground over which this work was constructed precluded any possibility of ditching. It was hazardous to break the

FLUME AND TRESTLE.

steep hill slopes any further than was absolutely necessary to anchor in the posts and sills. The trees and brush for 40 feet above and below this trestling were cleared and burned to protect the flume against accident and fire. Stumps on the upper hillsides are numerous, and a few small poles placed against them parallel with the trestle will afford protection against rolling rocks, while the many growing trees higher up give the best security against snowslides.

The average height of the inner posts approximates 3 feet, and the outer posts average about 6 feet, both being 7 inches in diameter. The posts are stripped of their bark, and set on sills of hewn timber 6 x 8 inches, with a length corresponding to the requirement. On the inner side only sufficient ground was excavated to permit the placing of a 3 or 4-foot sill, as might be necessitated. The outer post is set on a sill securely placed on the ground purposely excavated and leveled for it. A slope of 1½ inches to the foot is given to the posts, which are nailed to the sills with 60-penny nails. The caps are fitted with a gain to each post and nailed on both sides. The stringers (each 18 feet long) of 6 x 8-inch timber are hewn on both sides, gained on the lower side to the caps, and notched where they are nailed to them. They lap on both ends over every three bents. The bents are placed 8 feet from centers, and are braced crossways with 3 and 4-inch diameter round poles, spiked to the post caps. The structure is so strong as not to require any longitudinal bracing.

This particular piece of trestle work was commenced July 15th, 1895, and finished August 15th, 1895. The total number of hands employed was thirteen, and the entire cost, including labor, timber, tools and nails, aggregated $1109.69.

The drawing shows the construction of the flume

and trestle in detail, and the table gives the respective amount of timber each contains :*

	Feet, Board Measure.
Posts—7 in. diam. by 6 ft. by 3 ft.	10,395
Caps—8 ft. by 6 ft. by 8 in	12,330
Sills—8 ft. by 6 in. by 8 in	12,330
Stringers—18 ft. by 6 in. by 8 in.	27,930
Total	62,955

The lumber for the flume was cut at the company's sawmill, about three miles by wagon road from the present head of the ditch. It is a red fir of ordinary quality, such as is usually found in this country. The logs were cut during the fall and winter of 1894, and were fairly seasoned but somewhat checked. On account of the scarcity of ready material, about one-half of the caps on the flume were made of two pieces of 2 in. x 4 in. scantling, spiked together and then gained. All lumber used in the ditch and flume construction has been charged for at the rate of $14.05 per M., the mill charge. The greater part of the lumber had been culled over and the best planks selected for the sluices.

The flume at the head below the main gates is 6 feet wide and 4 feet deep. This size runs for a distance of 150 feet, tapering into a 5-foot sluice 4 feet deep, running a similar distance and tapering into the regular size flume as given in annexed table. The lumber, sawed but not planed, was carefully put together, all joints being closely battened. The posts were gained 1 inch into the sills and caps, respectively, and nailed. No side braces were used on the flume.

TABLE OF FLUME.

Flume 4 feet wide, 42½ inches deep, 12-foot box.	
6 posts 4 inches x 4 inches x 4 feet	32 feet.
3 caps 4 inches x 4 inches x 6 feet	24 "
3 sills 4 inches x 4 inches x 6 feet	24 "
4 bottom planks 1½ inches x 12 inches x 12 feet	72 "
6 sides 1½ inches x 12 inches x 12 feet	108 "
2 sides 1½ inches x 8 inches x 12 feet	24 "
9 battens 1½ inches x 4 inches x 12 feet	36 "
Total	320 feet.

Hauling and delivering of material at the head of the ditch was done by contract. Whenever the company's men or teams were employed on the ditch construction the ruling rates have also been charged to this account. As the flume progressed the lumber was floated to the work as required.

Labor rates were as follows:

Laborers	$2.50 per diem, 10 hours work.
Carpenters	$3.50–$3.25 " " "
Teamsters	$2 50 " " "
Two-horse team	$3.00 " " "

Teamsters supplied plows and scrapers, did their blacksmithing and furnished their own horse feed. All the men were boarded by the company's contractor at the rate of $1 per day per man, the company receiving 10% on all accounts. No credit for profits has been given in any statement of costs.

COST OF FLUME.

Labor	$ 879 50
Lumber	1,202 03
Hauling	191 23
Tools	7 66
Nails	176 00
Superintendence	125 00
Total	$2,581 42

The total amount of lumber charged above is 85,534 feet, B.M. In the side lining and intermediate boxes between the main flume and measuring box there have been used 23,769 feet B. M. lumber (additional). The details of this cost will be found in the final table.

The pressure box, measuring box and wasteway from pressure box contain 12,015 feet lumber. The sand box connects the measuring box with the pressure box, which latter is protected from overflow by means of a waste way. The measuring box has sufficient capacity to gauge 3000 miner's inches and can be increased should it be found desirable. The details of cost are given in the final table.

In the gates and boxes at the head of the ditch 3310 feet of lumber were used. Four small timber-cribbed dams (loaded with rocks), 4 x 6 feet in size, angling up stream, sunk 3½ feet and 4 feet high above creek bottom, hold the gates through which the water supply from Rapp's creek is drawn. There is a temporary obstruction thrown across the bed of the channel of Rapp's creek to direct the water into the ditch. The gates at the head are provided with a wasteway 10 feet wide, alongside of them, so as to regulate the height of the water entering the ditch. To thoroughly protect the flume from being destroyed by an overflow of the creek, or back water, another set of gates and wasteway have been placed about 50 feet below the main head gates, firmly set in the ditch on a bluff of rocks. The main flume, several hundred feet below the head, has been fitted with a large sand box, 48 feet long.

The cost of tools in the construction of this ditch and flume, as shown in the final statement, is insignificant. This is due to the fact that the plows, scrapers and go-devils were supplied by the men owning the teams, and the company had on hand a supply of tools left over after the building of the Leesburg road. Hence the only charge is for material consumed and a few necessary articles purchased.

The entire ditch and flume were completed and water delivered at the mine September 29th, 1895. The ditch will bear comparison with any first-class mining work of this character. The actual cost per cubic yard of material used was 46.2* cents ; the cost of 388 linear feet of lining, including material, was $2.07 per foot ; the cost of the flume per linear foot was 83.7 cents ; the cost of the trestle per linear foot was 35.9 cents ; the total cost of the entire work aggregated $5799.30 per mile, including superintendence, surveying, measuring box, pressure box, wasteways, head gates, cribs, etc., and all moneys expended from May, 1893, to May, 1895, which is materially less than any similar size structure built on the west coast in the mining region with the same rate of labor.

* Exclusive of braces.

* The cost per cubic yard as per tabulated statement is 39.9 cents. In this is properly chargeable all expenditures prior to May, 1895, which aggregate $1540.80, making total cost 46 2 cents per cubic yard

Outline of the Geology of California with Reference to Its Mineral Deposits.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS, Ph. D.

The most important geological revolution of which we have any record took place along the Pacific coast of North America at the close of Jurassic time. The sedimentary rocks in the Klamath mountains, the Sierra Nevadas and probably the great region to the south and east were folded together and involved in enormous masses of molten granite and lifted above the sea. The granite mountains before referred to had long existed along the axis of the Coast Ranges, and there no melted granite core was formed as far as we know; but they were uplifted to proportions perhaps comparable with those of the present day.

The next younger geological period which we recognize is the Cretaceous; but before the land again sank so as to permit sediments of that age to be laid down, hundreds of thousands of years may have elapsed during which the great gold and silver deposits of the State were formed. Considered from an economic standpoint, this period of mineralization has been the one great event in the ancient history of California.

After the granite had been squeezed into the sedimentary rocks, upturning and breaking them, this extensive region remained heated for a long time. As it cooled off, the mountain, making movements, again fractured the rocks, permitting the waters falling upon the surface to penetrate and circulate to great depths where they became heated through contact with the still hot and, perhaps in places, molten rocks. It may be that there were also other subterranean waters derived from different sources in addition to those derived directly from the surface.

Hot waters are capable of dissolving out various rock constituents, and after becoming impregnated with the alkalies are all the more effective in their action upon rock material. Many, if not most, of the rarer metallic elements are sparingly disseminated in almost all rocks, occurring possibly in many cases in greater amount as the depth increases. Many of these minerals were dissolved out by the hot waters which percolated through the fissures, and under favorable conditions issued upon the surface. As the waters began to cool and exist under less pressure in their upward course, various constituents were precipitated, the process resulting finally in the mineral veins which we now see exposed.

The mineral deposits along the western coast of North America are not sporadic, but are found thickly scattered over almost the whole of the great region where had occurred the violent geological disturbances already described, and we must conclude that their deposition was directly due to these disturbances. It is possible that the intensity of the mineralization bears a direct ratio to the amount of fusion and breaking up of the crust and subsequent fissuring. In the Coast Ranges, south of the Klamath mountains, there were no granitic outbursts at this time; and notwithstanding the fact that the rocks are much fissured and broken, there are no very important gold deposits, although gold does occur in small amount at many places, more particularly in the Cruickshank district in Monterey county.

The whole western border of North and South America is characterized by its mineral richness and its proportionate extreme geological complexity, and we must come to the conclusion that they are related to each other as cause and effect. It is, however, remarkable that many extensive volcanic outbursts are not associated with any mineral veins, as we notice in the case of the great lava beds of the northwest. It has also been noted that granite and other acid rocks (those rich in silica) contain gold as an original constituent, while the basic rocks (those poor in silica), such as basalts which form so large a proportion of many recent flows, do not contain it as far as we know.

It may be that in a disturbed volcanic district, when waters penetrate to the hot regions below, they have a greater opportunity to become enriched if they pass through granitic rocks which we suppose contain more disseminated gold than the basaltic rocks. As far as we know, granite underlies the auriferous slate series through the main gold belt, and it is also known that the granitic region of eastern California is rich in gold-bearing veins. The gold on the western slope of the Sierras was undoubtedly derived from sources underlying the slates and dikes so abundant on the surface.

As the Cretaceous period which follows the time of this important mineralizing action contains almost no gold (the exception will be noted later), there is good reason for believing that the innumerable gold and silver veins date from the time of the flow of the innumerable hot springs subsequent upon the granitic intrusion.

Although it is probable that the Sierra Nevadas and Coast Ranges existed as mountain elevations at that time, we must not suppose that the country had much of the appearance which it had to-day. It must be borne in mind that since the mineral deposits were formed, thousands of feet in thickness of disintegrated rock have been removed from the mountains and deposited in the deeper valleys and along the ocean shores, while immense mountain blocks have been elevated and depressed, through the formation of fissures on one side and subsequent tilting. Movements along these great fissures are frequently taking place to-day in Owen's valley on the eastern side of the Sierra Nevadas and in many other places in the State. Think for a moment how thickly the quartz veins, generally gold-bearing, are scattered the whole length of California in all kinds of rocks and in all positions, bearing in mind the probable conditions under which they were formed, and we are in a position to understand the incorrectness of much that is written upon prospecting and the occurrence of ore deposits in general.

We trace the original conditions for ore deposition to subterranean disturbances and probably the formation of molten rock masses. Following this there are hot mineral-bearing springs depositing the minerals carried in solution along the fissures in the rocks through which the waters pass. Now these fissures and the suitable chemical conditions for deposition may occur in any kind of rock and anywhere in the region where geological disturbances have occurred and have been followed by mineral springs, but they are more liable to occur in greater number and size where the fissure systems are numerous and regular. If, in addition, the strata have been evenly tilted and are cut by dikes of intrusive rock running in a direction parallel to the stratification, we have exceptionally good conditions for the formation of veins on a great scale. These conditions are all fulfilled on the main gold belt in California, and particularly along the mother lode, which in respect to the regularity of the upturned sedimentary strata, the associated dikes and great ore deposits cannot be equaled in the world. Not only have the dikes been intruded generally parallel to the stratification, but the fissure systems have also been formed along nearly the same lines. The regularity of the mother lode is thus seen to be due to fortunate geological conditions. The Mariposa beds, the sedimentary portion of which consists largely of slate, are the youngest of the auriferous slate series, and at the time of the granite intrusion were evenly and regularly folded. The diabase dikes known as greenstone are in part ancient volcanic flows, and in part fragmental volcanic rocks. It seems more than probable, judging from the character which is maintained by the ore bodies in the deepest workings, that they will continue beyond the greatest depth at which they can be worked profitably.

(To be Continued.)

LEESBURG GOLD MINING AND MILLING COMPANY—CONSTRUCTION OF RAPP'S CREEK DITCH.

	Grading and Excavating Ditch.	Trestle.	Main Flume on Trestle, Two Switches, 257 Boxes.	Pressure Box, Measuring Box, and Wasteway.	Side Lining and Intermediate Boxes Between Main Flume Measuring Box.	Gates, Boxes, etc.	Roads and Trails.	Totals.
Labor	$ 7,647.72	$1,051.00	$879.50	$148.18	$347.69	$30.00	$67.25	$10,171.34
Foreman	365.00		125.00		70.00	5.00		565.00
Surveying	162.00							162.00
Grading (teams)	1,728.87							1,728.87
Hauling lumber			191.23	9.00	24.00	8.00		232.23
Tools, steel, iron and coal	94.85	3.79	7.66					106.30
Powder, caps and fuse	33.09							33.09
Nails (51½ kegs)		54.90	176.00	29.13	29.69	6.27		295.99
Lumber (124,638 ft. at $14.05)			1,202.03	168.91	333.95	46.37		1,751.16
Totals	$10,031.53	$1,109.69	$2,581.42	$355.12	$805.33	$95.64	$67 25	$15,045.98

Lumber used in flume and trestle, 85,544 feet; in pressure and measuring boxes, 9,090 feet; in wasteways, 2,925 feet; in side lining and intermediate boxes, 23,769 feet; in gates and boxes, 3,310 feet; total lumber used, 124,638 feet. Timber in trestle reduced to B. M., 62,955 feet, is included in total cost of trestle under labor account, which represents the cost of hewing and setting, and also the excavation of 552.27 cubic yards of rock.

Mining Summary.

CALIFORNIA.

Butte.

Register: P. M. Dodge & Co. are opening a new gravel mine west of Oroville. A ditch is being cut for mining purposes. It is proposed to handle the gravel with teams and scrapers and then wash it for the gold. Five or six men are employed.

The Jim and Jack mine, near Pentz, is having a large bedrock tunnel driven upon it.

At Enterprise at least nine or ten mines will be in operation this spring.

The rock in the Red Point mine is soft, so the men are making excellent headway in the tunnel. It is believed that by the first of next month the ledge will be tapped, when it is the intention of the owners of the mine to erect a quartz mill, with a capacity of 20 stamps, to be run by water power.

Parties have taken hold of the Carlisle mine, and it is said that a new road will be at once constructed from the end of the Slater road up to the Carlisle property. The mill is almost completed, so that ten days' work will put everything in running order in the plant.

Dave Burroughs will start up the Bullion mill and push work on the mine within a few days.

It is said that work will be shortly resumed upon the Carlisle quartz mine.

Josiah Champion struck very good gravel near the old quartz mill in Price's ravine. Coarse gold has been taken out from a side ravine for many years in the winter season when there was water to work. Now Mr. Champion has water from the Forbestown ditch to work with.

Calaveras.

Prospect: From present indications next spring and summer will show a greater activity in mining in this county than was ever before seen, and even now with the fearful condition of the roads, machinery and lumber is almost daily being hauled in for the development of our mining properties. Work on the electric power plant on the Mokelumne river, near Mokelumne Hill, still goes on and by May or June it is expected that the company will have completed every arrangement to furnish cheap power throughout the county to all those desiring it. The California Exploration Company has at Valley Spring, awaiting the better condition of the roads for transportation, 900 poles for electric wires, each 25 feet long, 12x12 at bottom and 6x6 at top, one carload of wire and ten tons of insulators, besides a large quantity of lumber which has already been hauled to their mines at different points.

At Murphys the McQuig mine, known as the May Day, is being worked systematically. A small mill has been built and will be in operation soon.

The Carley mine has been producing some good ore. Their mill is in readiness and crushing can be commenced any day.

The report is current that the Geo. Taylor mine on Six Mile creek is under negotiation and may be operated by San Francisco companies.

El Dorado.

(Special Correspondence).—G. S. Estey, at Indian Diggings, is running a tunnel through a gravel bed. His objective point is the channel bottom. The tunnel is in 500 feet. He has been taking above $3 per day from the excavation.

The Pyramid mine, nine miles southwest of Placerville, has been bonded to a Scotch syndicate for $100,000, of which $40,000 are to be paid in 30 days, the balance within a year.

Dixon & Morton have sold their mining claim at Greenwood to Chicago parties, who begin extensive development work immediately.

The shaft on the Ohio mine, near Greenwood, has reached 300 feet. Superintendent Keeny is well pleased with the outlook of the property. It is owned by San Francisco parties. The Greenwood section is slowly but substantially advancing in the mining field.

The tunnel on the west end of the Lloyd property, adjoining the town of Placerville, is averaging 8 feet per day through a hard formation of serpentine greenstone, which in places is heavily mineralized. The shaft was sunk 60 feet on the ledge, which will be reached by the tunnel at 450 feet, giving 250 backs. Open cuts are being made about the center of the claim (which is 2900 feet in length), in one of which six fair-sized seams were found, which are yielding ore that assays above $30 per ton.

J. F. Webb, of St. Louis, representing the Granite Mountain people, is making an extended sojourn in this county, examining its mining resources. Mr. Webb is the inventor of an improved cyanide process, on which he has secured patents in every country in the world using the cyanide method.

Another rich ledge, the width of which is not yet known, has been discovered in the 300 level of the Gentle Annie property.

Meyer & Morrow have reached something over 100 feet in their tunnel on the ledge two miles northeast of Placerville, and are extracting a very fair grade of ore.

Grizzly Flats section, 26 miles southeast of Placerville, is making advances carefully and surely in the development of its mining resources.

Noyes & Langridge have reached 175 feet in their tunnel, adjoining the Gentle Annie property on the north. They are driving through a formation of sandstone. They expect to reach the shaft on their ledge next week.

Raymond & Tanner are discovering encouraging prospects in their development work, four miles southeast of town. They have three claims on the mother lode.

On the Empress Josephine, ten minutes' walk from the courthouse, the tunnel has reached 240 feet. At 150 feet it crosses the east ledge, which, including the porphyry, measures 10 feet.

In the Big Sandy, at Kelsey, sinking and drifting are progressing rapidly, and the work is developing encouraging results.

When the few silurians who hold large areas of mining ground are borne to the dust of earth, capitalists will meet with encouragement in seeking to develop properties for the owner's benefit, without being expected to pay great cash prices for the privilege of a permit to sink on undeveloped properties to ascertain what they may or may not contain. Fortunately there are but few of them left. When they are gone El Dorado county will prove itself one of the richest mining sections of the State.

Placerville, Feb. 23rd, '97.

Placer.

Sentinel: The task of driving the big tunnel of the Eureka drift mine is drawing to a close. Only about 20 feet more remains to be run to reach the hole to the 19-foot mark, where Mr. Chappellet intends to make the upraise. He has been only a little over a year in driving this tunnel.

At the Sellier Consolidated gravel mine, Potato Flat, an upraise will be made from a point 200 feet in on the main tunnel, to tap the gravel.

The Blue Canyon Mining and Develpment Company in the main tunnel are now cutting a ledge of soft slate. From now on rapid progress may be expected in the work of driving the tunnel.

Plumas.

Independent: Active work at the Bullion mine is being done by Nick Fryer & Co., in Mohawk. This property was purchased last fall by Nevada people, and machinery put on for working it. Concentrators are now being put in, and ten men are at work in and about the mine.

There are nine men working at the Claybank mine, and the tunnel is being rapidly driven ahead, about 40 feet per week being the average.

San Diego.

Ramona *Sentinel*: At Julian the Helvetia Mining Company have let a contract to take out 200 tons of quartz from the Helvetia mine at $1.25 per ton.

R. Gardiner has men at work taking out 100 tons of rock from the Richmond mine.

Fisher & Barclay, of Witch creek, are doing considerable improvement work on the placer ground near Ballena, owned by the Santa Ysabel Water Company.

Sierra.

Enterprise: Dr. A. Jump, who has for some time past been developing the old Baker ledge, in Sailor ravine, has built an arrastra and has several men employed.

The pump at the Thistle shaft was started up a short time ago to determine whether the water could be lowered or not. That it could was demonstrated, but it is questionable whether the works could be emptied of the great accumulation of water at this season of the year. At any rate, work was suspended, and it is understood that no effort will be made to resume until next spring. Whether the company will again attempt to work the rich mine through the shaft or tap it by means of a long tunnel, is not as yet determined.

Siskiyou.

Journal: Dr. Simons & Co., of the Minetti B mine, Klamath river, have fixed up their suspension bridge and pipe across the river, to turn the water in the first of last week, and are now working the giants with good success.

The miners of Greenhorn and Yreka Flats are making calculations on doing a great amount of work during the ensuing spring and summer in developing quartz and placer claims. There will be a good supply of water to work the placer mines, as the ground is full of moisture—most too much at present.

News: The affairs of the Gold Ball Mining Company have been adjusted and the mill will be started by March 1st and will employ forty men continually and crush forty tons of ore every twenty-four hours. The ore is from 8 to 15 feet thick and mills from $9 to $12 per ton.

Work in the Forks of Salmon hydraulic mines progresses steadily. W. P. Bennett has control of the water system of this locality and has a large area of mining ground located, which yields steady profits from year to year. There is sufficient ground to employ his plants for years to come.

The mine on McAdams creek, bought by S. J. Dore and others from Mr. Davis, will soon be in operation. Arrangements are now being made to put a force of men to work.

On the McKinley mine there are 150 tons of ore on the dump awaiting shipment to the Chester mill in Quartz valley.

The Diestelhorst dredger now operating in the Klamath, near Oak Bar, is meeting with good success. The river bed is somewhat "spotted," and the machine occasionally runs for a day or so without getting a color and at other times a rich deposit in the river bed will be encountered and several hundred dollars taken out in a day. The Diestelhorst & Barton Company contemplate putting in more dredgers next spring.

Tuolumne.

Independent: The Heath syndicate have bonded the Kelly and Clio mines at Jacksonville.

The Stanley mine on Kanaka creek is to be opened, and for this purpose a large force of men has been engaged.

The Jumper syndicate have recently struck a new shoot of ore on the New Era.

In the Andy Johnson mine at Jacksonville the shaft is now down 100 feet.

The Mountain Belle is now unwatering the main shaft.

Work on the Draper mine continues, and the shaft is now almost cleaned out to within 40 feet of the last level, which is down some 300 feet. Sinking will then begin.

The Alabama mine is steadily sinking and has encountered some very fine ore.

The Black Oak has struck richer ore than ever at the bottom of the shaft.

The new shaft at Whisky Hill is now down 110 feet and a drift is to be run to crosscut the ledge.

The Macaroni mine at Big Oak Flat has recently struck a rich streak of ore.

The Wood Creek mine has its shaft down 80 feet. A tunnel has been started to tap the ledge 200 feet from the surface.

The Shawmut mine has a force of twenty-five men at work. The stamp mill now in course of erection is approaching completion.

The Belleview continues sinking, and the chances are that the ore now being uncovered will warrant final payments on this property.

The Rappahannock will soon commence the erection of a 15-stamp mill, the quality of the ore taken out of late justifying such a course.

The Pino Blanco has recently run its tunnel easterly and encountered a large body of ore 50 feet wide, which assays well. The footwall has not yet been reached.

Union Democrat: The Mammoth has attained a depth of 700 feet, and at that point shows a strong 30-foot ledge of ore. The mill not only does its own crushing, but that of the Shawmut besides.

At the Shawmut Supt. Halsey has fifty men employed underground and on top, and the miners are extracting a good grade of rock.

On the App operations are confined principally to work between the 1000 and 1100 levels, and the twenty stamps drop night and day.

At the Golden Rule the perpendicular shaft has been sunk 500 feet. A 10-stamp mill is on the mine now, but twenty more stamps will soon be added, when the property will be worked to its limit. At present about twenty underground miners do all the rock breaking.

NEVADA.

An expert has estimated that the placer deposits at Rock hill, Humboldt county, Nevada, will yield $1,000,000 in stream gold. The property is operated by a Chinese company.

OREGON.

Rogue River *Courier*: E. C. E. Smith, a mining expert recently from John Day district, has bonded the placer mining grounds on Sardine creek, from Messner's to E. N. Williams', a distance of six miles. It comprises 1100 acres of mining ground and the consideration is $35,000. Mr. Smith expects to sell the property to an English syndicate.

The Baylord-Iliff pump placer mine above town shut down after the cleanup last week and discharged the men. It is said operation will begin again in a couple of weeks. Quien sabe!

Baker City *Bedrock-Democrat*: The Maxwell mine is undergoing extensive development, three levels being run. It is equipped with a 10-stamp mill and four concentrators. It is the intention of the management to start the machinery in motion in the near future. There is a large amount of good rock in sight.

The regular outputs from the Virtue, Bonanza, North Pole, Columbia, Eureka & Excelsior, Red Boy, Union Companion, Gold Ridge and other valuable properties are doing much to stimulate mining in these parts as well as to attract the attention of outside capitalists. A number of new properties, among them being the Flagstaff, Columbian, Perry, Ohio and Rachael, will soon be added to the list of producers, materially increasing the bullion output, which cannot fail to place this favored section among the leading camps of the West.

BRITISH COLUMBIA.

VANCOUVER TO ROSSLAND.

(Special Correspondence).—Interest in mining development in this province continues not only unabated, but rapidly on the increase, and "when the snow flies," men will be at work in every district. In Victoria and Vancouver there is scarcely a man who is not interested in some form or other of mining enterprise, and the same holds good of all the other centers of population in the province, and beyond it into the populous cities of eastern Canada.

The excellent reports of the provincial mineralogist, Professor W. A. Carlyle, have done much to satisfy people that British Columbia is a first-class field for the expenditure of large sums of money in legitimate mining with less than the average amount of risk that is usually involved in prospecting in new country.

Traveling by the Canadian Pacific railroad from Vancouver to Rossland one finds indications of mining every few miles of the way.

At Yale considerable work is going on, and later in the year it is likely to be a busy camp. In the days before the railway it was an important point, being the head of navigation and the depot for freighters and pack teams. Extensive operations are in progress at the Queen gold and silver mine about two and a half miles north from the C. P. R. station at Yale. The managing director is William Teague, Esq., J. P., and his chief assistant is T. H. Rablin. The property is owned and operated by a stock company with a capital of $500,000, the head office being in Vancouver. It is a tunneling proposition and there are about 2000 feet of prospect tunnels. On the Queen mine there appear to be three ledges from 50 to 60 feet apart which at the time of the writer's visit to Yale measured 4½, 6 and 12 feet respectively, and the presumption appears reasonable that they will join at a depth. The rock carries galena, copper and arsenical pyrites and blende. It is not unlike some of the Comstock ores. Later it is probable that the company will put up a cyanide plant and a small smelter. As regards water and wood nothing better is to be found anywhere. Capt. Teague has a number of assays yielding from 25 to 100 ounces of silver to the ton, and gold from 2½ to 6 dwts. per ton. The country rock is a gray garnetiferous gneiss. About 25 to 30 men find employment at the mine.

At Siwash creek, east of Yale, is a group of mines containing an immense body of low-grade, free-milling ore that averages from $2.50 to $6 a ton. This Siwash creek property has been bonded by Mr. Symington on behalf of some English speculators, who expect to be able to work it at from $1.50 to $1.75 per ton. There is plenty of cheap water power to be had, and this expectation may be realized.

Just below the town of Yale is the celebrated "Hill's Bar," which in 1858-9 is said to have yielded upwards of $1,750,000. Above the old Bar, and immediately opposite the town, is a flat of 640 acres known as Hill's Bar Flat. The owner is T. H. Ladd of Merrill, Wisconsin, who has in preparation a very comprehensive scheme for the introduction of an ample water supply.

A good many Chinamen are at work in several localities around Yale, and appear to be doing well.

The population of Yale is about 200. Before the railway came through in 1886 it was about 1500. With the revival in mining it will in all probability soon recover lost ground. Good accommodation is to be had for travelers.

Following the Fraser river up to North Bend, twenty-seven miles distant, some considerable hydraulicking is met with. The work is in charge of Captain M. N. Garland, as the representative of a Montreal company. The ground here is rich and averages well, but the water runs short at times, though the great Fraser river rolls along below the edge of the property. Capt. Garland has cut a ditch and put in a quantity of flume to bring in water from '49 creek, but the ultimate solution of the difficulty in this and some other rich spots in the same district will be some scheme of raising water in sufficient quantity from the Fraser river itself. Last season only one monitor was at work. The gold is unusually coarse, and the cleanup averaged about $100 a day per man.

From the cars at different points along the Fraser river gold dredgers can be seen at work. From what one can learn, they are not very successful. They are in the aggravating position of being able to prove that the gold is there in quantity, but their appliances are insufficient to contend with the difficulties in securing it. The volume of water in the Fraser is great, the current very rapid, and the bed of the river for the most part uneven and broken. In addition, much of the gold that is raised is lost, owing to the enormous quantity of salmon eggs in the water. They make everything greasy, sometimes even choking up the riffles and rendering it almost impossible at times to save the gold. This sounds fishy, but it is true.

In the influx of population that will take place this summer Kamloops will in all probability receive more than its proportionate share of the newcomers. There are several reasons for this, the first being its situation and the next the salubrity of its climate.

The mining excitement has spread to Kamloops and within the past six months about 300 claims have been staked out, principally on Coal hill, a few miles southwest of the town. Some of these claims look promising, but little or no work has been done on the most of them.

The Iron Mask is operated by the British & Canadian Gold and Silver Mining Company, of which Hon. N. Clark Wallace is president. W. T. Newman, a Toronto expert and author of "Hidden Mines and How to Find Them," is in charge of the work. The Iron Mask appears to be a fissure vein. The foot wall is of trap dyke. At a depth of 50 to 60 feet there are two crosscuts. One is in 36 feet and the other 44 feet, and there are no signs of a hanging wall. There is clean ore running from 18 inches to 4 feet on the foot wall, and clean ore again in the 36-foot crosscut. The ore is solid without a break, laterally, and runs to an average of about $70 a ton, all values.

The Python, about four miles southwest of Kamloops, is owned by a local company, the Inland Mining and Development Syndicate, of which W. F. Woods is the president. Considerable work has been done here. There is a shaft down about 55 feet and about 70 feet of tunneling. Both the shaft and the adit are nearly all in ore. Assays give from 15 to 30 per cent in copper and from traces to $40 in gold.

To the west of Coal hill A. G. McDonald and Wm. Ford are opening up the Bonanza claim. There is a 13-foot ledge between well-defined walls from the grass roots. The ore carries copper in considerable quantity and gold from $4 to $21 per ton by assay.

The Tranquille Creek Hydraulic and Quartz Mining Company, Limited, is beginning extensive operations at Tranquille Creek, about nine miles below Kamloops. The trustees are James Vair, J. H. Russell and M. J. McIver. The capital is $250,000, divided into $10 shares. Hewitt Bostock, the newly-elected member to the Dominion Parliament, is largely interested in this company, which starts to work with a large area of thoroughly proved ground ahead of it.

The Yale & Homestake Gold & Silver Mining Company's property is fifty-six miles northeast of Kamloops by wagon road. It is an incorporated company, with head office in Vancouver. The capital is $400,000, divided into 1,600,000 shares of 25 cents each. Sufficient treasury stock has been disposed of to provide for development and to start operations this spring free of debt. Mr. Pellew Harvey, the Vancouver expert, says that there are 60,000 tons in sight, mostly low-grade ore. Already sixty tons of the high-grade ore has been taken out. This averages over 100 ounces in silver, and from $4 to $120 in gold. The low-grade ore averages about 15 ounces in silver and $1 in gold. With a view of working this extensive property (seven full claims) to the best advantage, Mr.

Pellew Harvey has been commissioned to visit Europe, taking with him bulk samples for treatment at Swansea, Glasgow and Freiburg, and it is probable that as a result of his investigations a cyanide plant will be put in at once.

About twenty men are working at the Cinnabar mines, twenty miles west of Kamloops. At the first start of these mines the management erected retorts that could handle two tons a day, but the ore is of so low grade that furnaces capable of handling twenty to twenty-five tons a day are now about being put up. The head office for these mines is in Vancouver, and extensive work is arranged to begin this spring.

The Glen iron mines are about fifteen miles west of Kamloops. They have already shipped over 5000 tons to Tacoma, the ore being used principally for fluxing purposes by smelters. For these the ore has to contain 50 per cent iron. Much of it, however, runs to 65 and 75 per cent. There is an immense deposit, and some day when population increases it will probably be useful for iron on the ground.

At Revelstoke, which is the junction where one turns off to Arrowhead to take the steamer for Trail, there is little going on in a mining way near at hand, though there are prospectors out in the surrounding hills. Many miners, however, make this their winter quarters, and it has all the appearance of a mining town. A stranger can get the best of information upon all matters pertaining to the district upon application to Mr. Graham, the government agent, while at the Columbia House there is a cabinet of large proportions, the collection of W. B. Pool, containing well-indexed specimens of nearly all the varieties of ores to be found within a radius of 100 miles. In the Larado country, forty miles south of Revelstoke, considerable work is going on. Several companies are doing work there on a large scale, and dozens of claims are carrying on development in an unpretentious way, but until summer opens it is difficult to get into the country thereabouts and obtain precise information.

From Arrowhead to Trail, the sail down the Arrow lakes takes a night and most of next day. It is picturesque in the extreme, and the boats are most comfortable. At short intervals nearly all the way there are evidences that the prospector is getting his work in. Some of the specimens brought in from the Arrow lakes are equal to anything hitherto produced in the province.

Trail is a particularly lively camp, building going on in every direction, and good prospects reported all around.

At Trail there is some difficulty in arriving at the exact facts about the smelter, and the gentlemen in charge are somewhat chary of allowing a visitor to arrive at an independent opinion for himself. Mr. Heintze, the owner, in a recently published interview, stated that it is not working up to its fullest capacity, while, on the other hand, the mine owners allege that the smelter cannot overtake what they are prepared to send in. In proof of this assertion they point to the large quantities of ore now being shipped to American smelters and state that Mr. Heintze's statements are largely prompted by the desire to keep competitors out of the field and to maintain the present high scale of prices.

Rossland is about twelve miles by rail and half that distance by road from Trail, and omnibus sleighs run at frequent intervals. Nothing on wheels is to be seen here at this season of the year. Matters at present are quiet in Rossland, but a more detailed account of this remarkable mining town must form the subject of another communication.

During the past year British Columbia has made giant strides. New discoveries are reported everywhere over a territory of from 700 to 800 miles by 400 miles. Indications point to the fact that nearly the whole of it is well mineralized. Attention has been turned to railroads in various directions, and, when outside places are made accessible, while every prospect will not turn out a mine, British Columbia will be reckoned an important factor in the world's supply of the precious metals.

R. W. W.

Rossland, B. C., Feb. 19th, '97.

In the Provincial House of British Columbia the Provincial secretary has presented a return showing the amount of the mineral output of the province for the year 1896. The return also gives the aggregate product for the last seven years. They are as follows:

Year.	*Value.*
1890	$2,668,608
1891	3,546,709
1892	3,017,971
1893	3,588,413
1894	4,225,717
1895	5,655,302
1896	7,146,425

British Columbia's minerals have produced wealth amounting to the enormous sum of over $100,000,000, as follows:

Gold (placer)	$57,704,855
Gold (lode)	2,177,869
Silver	4,028,224
Lead	1,606,427
Copper	254,862
Coal and coke	33,934,427
Building stone, bricks, etc	1,200,000
Other metals	25,000
Total	$100,931,604

The output of minerals from the various districts during the past two years is as follows:

	1895.	*1896.*
Cariboo	$282,000	$384,050
Cassiar	22,575	21,000
Kootenay, East	17,575	154,427
Kootenay, West	2,223,206	4,002,735
Lillooet	40,663	33,665
Yale	241,581	206,078
Other districts	10,000	15,000
Total	$2,834,000	$4,816,955
	1895.	*1896.*
Placer gold	$481,683	$544,026

In 1887 the product of lode mines was $17,331, and in 1896 it had increased to $4,257,176. From 1887 to 1896 the output of silver, gold, copper and lead was from lode mines, $8,067,322. In 1896 the output of coal was 846,235 tons, valued at $2,327,145. The total amount of coal and coke produced since the industry began is 11,248,859 tons, valued at $33,926,662.

UTAH.

THE TINTIC DISTRICT.

(Special Correspondence). — Eighty miles southwesterly from Salt Lake City, on the west slope of the Tintic range, is the Tintic mining district, included in which are the mines of Eureka, Mammoth, Robinson and Silver City. Here is a most interesting district, containing such well-known producers as the Mammoth, Centennial-Eureka, Eureka Hill, Bullion-Beck and Gemini. The first named is principally gold and situate just above the town of Mammoth. The last four are on the Eureka side of the mountain spur which separates Eureka from Mammoth, and are chiefly silver-lead properties. To the southward from Mammoth, and separated from it by a spur of hills, is Silver City, where there are the Swansea and South Swansea mines, which are profitable producers.

The ore bodies of the district occur in immense deposits, ranging in depth from 100 to 200 feet, the great mass of which is low grade, but within are bodies of very high-grade ore, existing in pipes, chutes and other forms. The general strike of the deposit is in a north and south direction, with a dip toward the northwest. It is clearly a contact deposit, between granite below and shale above. The deposit is an extensive mineral zone, consisting of dolomite lime, and has been exploited from Eureka on the north to the Buckeye, south of Diamond.

The ores from the Mammoth, Centennial-Eureka, Bullion-Beck, Eureka Hill and Gemini are of a siliceous nature and carry gold, silver and copper. Those from the Swansea and South Swansea are a sulphate of lead, carrying high values in silver. The Carissa mine, southeast of the Mammoth, is more distinctly a copper property, its ores running 15 to 20 per cent copper, with light values in silver and gold. The Ajax, better known as the Copperopolis, is also a copper mine, shipments from which have been running from 10 to 25 per cent in copper.

The gold ores of the district, which are designated as high grade, run from 2½ to 30 ounces gold. These high grades in gold are observed to run very low in silver. Such ores are largely free milling. The low-grade gold ores, which exist in very large bodies, are found profitable to mill when they run as low as one-half ounce to the ton.

The ore treatment, as exemplified at the Mammoth mill, consists of crushing and battery, from which the material is discharged through a 40-mesh screen upon copper plates. The tailings run automatically from there to Frue vanners, where the baser materials are concentrated. The tailings from the vanners drop to the pan floor and there the pulp is put through the amalgamation process in the regular way. In this mill two-thirds of the values saved are from the amalgam plates, while one-third is in the form of concentrates. This two-thirds saved in bullion comes from 90 per cent of the ore tonnage, and the one-third saved in concentrates comes from the other 10 per cent of the ore tonnage. The Mammoth mill's output, divided up, is 75 per cent gold, 23 per cent silver and 2 per cent base metal.

The depth of the Mammoth main shaft is 1600 feet, that of Centennial-Eureka 1500 feet, Eureka Hill 1100 feet, Bullion-Beck 900 feet, and Gemini 900 feet. At these depths these properties are absolutely dry mines. In the Mammoth, as depth is attained, the silver and copper values appear to grow less, while the gold values of the ore increase. In addition to its main shaft, the Mammoth workings consist of thirteen levels, each of which extend from 500 to 1900 feet. The nature of all these mines makes extensive timbering necessary, which are put up in square sets. The supply of timber for this purpose is shipped largely from Oregon.

The Bullion-Beck has nine levels, amounting to eighteen to twenty miles of working. Here the ore carries comparatively little gold, but averages 50 to 60 ounces in silver and 10 to 15 per cent lead to the ton. The higher grades go to the smelters. The concentrating ore, running 10 to 12 ounces silver and about 8 per cent lead, is reduced in the ratio of six tons of ore to one ton of concentrates. The mine is producing 300 tons of ore per day—100 tons of high grade and 200 tons low and medium grade.

The Eureka Hill is the oldest mine in the district, having been opened as early as 1869. This is on the same hill as is the Mammoth, though on the opposite side from the latter. The Eureka Hill ores differ from those of the Mammoth only in the fact that their silver-lead values preponderate, while in the latter mine the gold is the chief product. Of the output, about one-half the values are saved in amalgam and the other half in the form of concentrates.

The mills of the district are of that capacity and equipment calculated to surprise those unfamiliar with the district. The Eureka Hill mill, which is claimed to be one of the largest combination (amalgamation-concentration) mills in the world, has a capacity of 200 tons per day, though it is not now running full time by reason of insufficient water supply. It has 100 rapid-drop stamps. The Bullion-Beck mill is purely a concentrating plant and is equipped, for the treatment of low-grade ores, with jigs and Cornish rolls and Frue vanners, and treats 200 tons per day. The Farrell mill is of the same type as the Mammoth and Eureka Hill, but of much smaller capacity.

The Centennial-Eureka, the Gemini mines and others have no milling facilities and ship their product to the smelters.

Some experiments have been made on Tintic ores with cyanide treatment, and it is claimed a saving of 85 to 90 per cent was made in these tests. These ores, however, differ materially from those of Mercur which yield to cyanide, in being very hard and of close texture.

Twenty-five miles west of Mammoth are the springs of water and pumping plant of the Mammoth Mining Company. A pipe line conveys the water to Mammoth and Robinson and supply the mine, mill and the two towns. The plant was put in at a cost of $100,000.

It is not outside the range of conservatism to say that Tintic district is one of very substantial character, as shown by present development and production, and, so ar as the future is concerned, is one of the most promising in the State of Utah. The district has superior transportation facilities, having the Union Pacific and the Rio Grande Western, both of which afford good train service.

WASCOTT.

Eureka, Utah, Feb. 17th, '97.

SOUTH DAKOTA.

Black Hills *Times*: Dacey and Kilpatrick Bros. will in a short time inaugurate extensive development work on their claims in Ragged Top and on the Iron creek divide. A new hoist will be placed on the Flora shaft, which is now down 230 feet, and still in the lime formation. Regular shipments of ore are maintained from the original workings, the output being from 35 to 50 tons per week. Some thirty-five men are regularly employed on the property.

A new district is now being opened up in the scope of country between Custer Peak and Nahant station, on the line of the B. & M. railroad. Considerable float rock has been found which assays from $2.50 to $18 gold per ton.

The Keystone Mining and Milling Company have accepted a proposition for the sale of their property to an English syndicate, and preliminaries were recently closed by which the proposed buyers have sixty days to examine and satisfy themselves of the value of the property.

Baldwin and Pinney are making a success of treating the Keystone concentrates by the cyanide process.

WYOMING.

In the Keystone district a rich strike has been made in the Mastodon mine, the properties of the Spring Creek Placer Company. At a depth of 40 feet a streak of white iron ore has been struck, averaging from 15 to 18 inches in width and showing free gold running into hundreds of dollars per ton.

At South Pass mining is being revived through the successful application of the cyanide process to large bodies of ore in the region heretofore supposed to be of too small value to work. During the past week eight cyanide plants have been located in the district, most of them working on the tailings of abandoned mines. The first plant was brought in by two Mercur, Utah, men who purchased an old dump for $500. They put in four cyanide tanks and cleaned up $7,500 in the short season which followed. All of the old dumps in the district are now in demand.

A discovery of gold in a limestone formation, similar to that of the Ragged Top ore, has been made at the Needles, on Clear creek. There has been a big rush to get claims and a large number of locations are being made.

Negotiations are being made for the sale of the properties of the Douglas Consolidated placer properties in the Keystone district. The purchase price is placed at $80,000, and an equivalent will be spent in putting the property in working order. The Breitung Mining Syndicate of Chicago, is the prospective buyer.

The Spring Creek placers, in the Douglas district, have been sold to an Eastern syndicate represented by Weir & Sturgis of Cheyenne. The purchase price is given at $24,000, and the first payment has already been made. The property, which was owned by C. G. Wolcott, William Storey, Thomas Hale and W. O. Owen, contains 740 acres, extending along Spring creek for a distance of three and a half miles. The new syndicate will at once commence work on a six-mile ditch from Douglas creek. This, it is estimated, will cost about $9,000, and will be completed in time for this season's work.

MONTANA.

Inter-Mountain: The property of the Clinton Mining Company was sold recently to Henry Williams, the general manager of the Colorado Mining Company, for $7400. The Clinton mine is located in Park canyon. Mr. Henderson purchased the property for about $40,000 eight years ago and expended $45,000 in running a tunnel 1800 feet into the side of the mountain.

At the Diamond Hill mines, of which Col. Thomas Ewing is manager, the recent rich strike in F tunnel holds as good as when first cut. It has proved to be the best large ore body yet uncovered in the mine. A force of men has been drifting on the ore, running a tunnel 9 feet wide by 9 feet high in the clear, all in ore. Practically all of the ore is said to be free milling, and, while not high grade, is rich enough to yield good returns for the milling. The men are pushing the tunnel from 16 to 20 feet a day.

The quartz mining industry of Beaverhead county employs 300 men, placer mining 75. For the calendar year 1896 the production of metals was as follows: Gold, 3025 ounces; silver, 360,470 ounces; copper, 239,631 pounds; lead, 1,326,997 pounds.

Butte *Miner*: The Montana Ore Purchasing Company has suspended work at the 800-foot level at the Glengarry for the present. The pumps have been hoisted to the 400-foot level, where the water will be allowed to rise. About 150 tons of ore are hoisted daily, partly by lessees.

At the Atlantic mine sinking to the 800-foot is in progress. At the Leonard shaft the working force is increased and the amount of ore hoisted is 400 to 450 tons daily. At the West Colusa only a few men are employed and nothing but first-class ore is hoisted through this shaft.

It is reported that an agent of the Butte & Boston Company has been negotiating for the Climax mine at Divide, about eighteen miles from Butte. The mine has been worked for many years and a good deal of valuable ore taken from it.

The shaft at the Colusa Parrot mine is down to the 1200-foot level, where a station is being made, and from the station crosscutting will commence at once. At the Original mine sinking is going on and before a station is made the 1000-foot level will be reached.

The Park canyon district is attracting more attention at present than for a long time past. The strike reported in the Sullivan mine has had the effect of increasing the interest in claims in the locality.

The Colorado Company will soon put an increased force of men on the Old Glory mine, which was purchased last month from John Bordeaux and others for $45,000.

COLORADO.

Denver *Republican*: At Cripple Creek the January gross production of the Elkton mine amounted to $81,310.60, which returns a net profit of $59,159.56. The property is looking exceptionally well and is producing some ore that averages $223.77 per ton. The milling ore will run over $45 per ton. The main double compartment shaft has a depth of 400 feet, while the number of feet run in levels up to date is 4,325. From September, 1895, to Jan. 31, 1897, the gross production from the property amounted to $602,046.26.

The total production from the Union Company's Bull hill properties for January amounted to thirteen broad gauge cars, ten of which contained smelting ore, and three mill grade. The smelter returns received up to the present time for January are $14,972.45. The disbursements for January, including construction, permanent improvements and mine operating expenses were $21,500.

The Bacon Gold Hill Consolidated Gold Mining Company have executed a bond and lease on its Gold hill property, the Bryanboro, and a lease on its Beacon hill claim, the Lucky Boy. The bond on the Bryanboro calls for $75,000 and the lease runs for eighteen months. Kansas City parties will operate the property. The Lucky Boy claim has been leased to Cripple Creek parties for a term of eighteen months.

Murphy & Judkins are producing an average of twelve tons a day from their late find in the Smuggler of the Isabella Company.

After reaching the vein from the first station in the new shaft on the Pharmacist, a level has been run 60 feet on the ore, showing the pay to be from 2 to 4 feet in width. The ore broken in the new level is paying all expenses of operating the mine. Since August Manager A. D. Jones has expended between $50,000 and $60,000 in dead work and improvements.

February is going far ahead of January in the production of ores from the Cripple Creek district. The same overcrowded condition exists at the mill, but the ore haulers and railroads have expanded to meet the heavier tonnage, and things are better adjusted all around to the increased output. Just what the increase will amount to cannot be accurately foreseen, but at the present rate the aggregate will reach $1,500,000.

At Ouray in the Bank of San Juan in the Sneffles district, a force of men is driving a crosscut to cut the vein at a depth of 600 feet from the surface, and the tunnel is now extended 1,000 feet.

Col. Mix, owner of the Calliope, reports 350 feet of high-grade ore stripped in the upper level, with 800 feet of stoping ground overhead.

The shaft in the Wedge is down 370 feet, where a station is cut, and a level driven to both veins, which are apart about 70 feet. The main vein at the point of contact shows a large body of high-grade ore and the spur or feeder contains a fair streak of low-grade ore, which does not pay for shipment alone, but would realize rich returns if treated by smelters near by, and this can be done in the spring, as Ouray has three propositions of this kind in contemplation for erection within two months.

The Fowler smelter is likely to be the first in the field, as news was received last week to the effect that the machinery for the plant is all completed, with the exception of the furnace, which is now in course of construction.

About seventy-five dump cars of ore per shift is the average coming out of the Revenue tunnel at present.

Warde & Co. will resume operations on the Esperanza this week. A crosscut will be driven 175 feet to tap the vein and then 200 feet will be run on the latter.

A long crosscut is being driven by Theo. Hess to tap the Black Silver vein at about 350 feet in depth.

ARIZONA.

Prescott *Courier*: At Walnut Grove, S. E. Fuller, of Prescott, and Mr. Sweeney, of Chicago, have been prospecting placer ground with the intention of putting up a steam plant.

Placeritas mill is running steadily with thirty men at work in the mill and mine.

McNary Bros. have struck some rich placer ground on Mill creek and are taking out from $5 to $8 per day.

Globe *Silver Belt*: Active operations have been commenced at the United Globe mines which consist of some thirty mining claims, a smelting plant, cable tramway and other improvements necessary to the operation of the mines. The supply of ore is drawn principally from the Hoosier, Buckeye, Dime, Big Johnny and Birdsnest.

The United Globe Miners' Company, owning thirty of the richest copper mines in the Globe district, has started its furnaces again after a suspension of several years. A 3000-foot bucket ore carrier from the main property to the smelter has just been completed and works well.

Scientific Progress.

Formation of Clouds.

Until John Aitken proved by experiment that cloud particles are formed by the adhesion of water vapor to the dust-particles invisibly floating in the atmosphere, little was known of the real nature of clouds. The lowest stage in the formation of clouds is haze. The sultry haze, the suffocating fogs, the drizzling mists and the thin rain, as well as the pelting hail and the feathery snow, are now all known to be different stages of the vapor in the air on the minute dust-particles at different grades of heat and cold. The formation of the clouds is now distinctly understood. But, says Dr. MacPherson, the attention of the meteorologist has not been so much directed to the decay of clouds.

Whenever a cloud is formed it begins to rain, and the drops shower down in immense numbers, though most minute in size. No doubt it is only in certain circumstances that these drops are attracted together so as to form large drops, which fall to the earth in showers, or deluge. But when the temperature and pressure are not suitable for the formation of what we commonly know as rain, the fine drops fall into the air under the cloud, where they immediately evaporate from their dust-free surfaces if the air is dry and warm. Whenever a cloud overhangs, fine rain is falling, so that the cloud is in the process of decay; but this rain may not reach the earth on account of the dryness of the stratum of air beneath the cloud, and the heat of the air over the earth. So that on a summer day, with the gold-fringed fleecy clouds sailing overhead, it is really raining, but the drops, being very small, evaporate long before reaching the earth. It rains, but much of this melting of the clouds is reproduced by a wonderful circularity, the moisture evaporating, seizing other dust-particles in a cooler stratum, forming cloud-particles, forming again, and so on *ad infinitum* during the existing circumstances. That is the reason why surfaces may be exposed to a cloud on a mountain side without being wetted. Radiant heat is the cause of the remarkable result. The rays of the sun, which strike the upper part of the cloud, not only heat that surface, but also penetrate the cloud and fall on the surface of bodies, generating heat there. These heated surfaces, again, radiate heat into the superincumbent air. This warm air receives the fine raindrops from the decaying cloud and dissolves the moisture from the dust-particles before the moisture can reach the surfaces exposed. That a vast amount of radiant heat rushes through a cloud is clearly shown by exposing a thermometer with black bulb *in vacuo*. On some occasions a thermometer would indicate from 40° to 50° above the temperature of the air, thus rendering the surface quite dry. Hence seats, walls, posts, etc., may be dry, though in the middle of a cloud which is gradually decaying.

Of the numerous new substances made known by chemists early in the present century, Dr. T. L. Phipson says, in *Knowledge*, by far the most unpromising of possible usefulness was the metal thorium and its oxide thoria. Berzelius, the discoverer, succeeded with difficulty in extracting a minute quantity of the metal in powder from the Norwegian rocks. Aside from burning at a red heat with greater brilliancy than even magnesium, thorium seemed to have no striking properties, and its oxide resembled common lime, but the light-giving property is just bringing this rare metal from the complete oblivion in which it has lain for seventy years. Of all the metallic oxides that have been tried for the "hoods" or "mantles" of incandescent burners, which are making street gas a rival of the more expensive electric light, none has proven equal to thoria. The consequence is a brisk demand for this substance, so long believed to be useless, and at various times during the last two or three years a pound weight of thoria has been freely sold at from $220 to $250. The minerals thorite, orangite and pyrochlore, which contain a large amount of thoria, are still very rare. A more promising source of supply is monazite, which contains 18 per cent of thoria, and forms 1 to 7 or 8 per cent of the so-called monazite sands that have been recently found in some quantity in North Carolina, Brazil and Quebec. Several hundred tons of the sand are now shipped yearly from Brazil to England or Hamburg, while a ton of the Norway thorite and orangite supplies $35,000 of thoria in the same time.

Silichromite is a new mineral compound, manufactured in France. It is an extremely hard, crystallized mass, but easy to pulverize, and is used for molding and polishing purposes. The product is obtained by treating natural chrome ore, sand and coal in an electric furnace. Chromate of iron itself is a mixture of chromite, protoxide of iron and aluminate of magnesia. When to this mineral silica and carbon is added, and the mixture subjected to the heat of the electric furnace, there remains in the furnace a molten mass of crystalline structure, in which the silicate of chrome predominates. It will be seen that silichromite is closely related to carbide of silicon or carborundum.

Electrical Progress.

"Wood" Direct-Current Multipolar Dynamo.

The dynamo, illustrated on page 169, runs at a comparatively low speed, while the temperature, when run continuously on full load for ten hours, rises but 35° centigrade above the room. The lower portion of the field and pedestals is cast in one piece and is mounted to slide on a metal sub-base, on which the dynamo is reversible. This is brought about by the use of a curved pedestal at the commutator end, which enables both ends of the bed to be equally distant from the center of the field magnets. The field coils are wound on steel shells, which are slipped over the poles and held in place by the pole shoes. It will be noticed that there is an entire absence of terminals and other connections around the field magnets of this dynamo, there being only the two cables, which leave the brush holders and pass under the base, where they make the necessary connections with the field coils and main binding posts, which are mounted on slate bases at each side of the forward pedestal. The two small binding posts, shown in front, are connected with the shunt coils and are intended for connection with the field rheostat.

The Mutual Electric Light Company, San Francisco, have purchased a generator of this character, of 200 kilowatts capacity, for operating a power circuit in this city, which will shortly be placed in operation. This dynamo is manufactured by the Fort Wayne Electric Corporation of Fort Wayne, Ind., represented by Chas. R. Lloyd, 18 Second St., San Francisco.

New X-Ray Phenomena.

Sir David Salomons has recently been experimenting with X rays and contributes the following results:

1. A strong magnetic field stops the passage of the current in the tube.

2. With a "shadow cross" tube, a very small magnetic field near the cathode causes the shadow to disappear.

3. A bar magnet (say 9″×1″×½″) will produce the same result when held anywhere near the side of such a tube. If the magnet is too weak, then the shadow will not quite disappear.

4. If a pole of such a bar magnet be held axially to the tube and the pole placed to one arm of the cross, then on rotating the magnet in a circle (i. e., its axis describing a cylinder) the cross will rotate also, either following or advancing before the pole according to the pole applied; in other words, attracted or repelled.

5. The bar magnet also affects the "focus tube," rendering the X-ray results far less when a pole is near the tube.

6. In a suitably adjusted magnetic field a Crookes tube exhibits only the usual vacuum tube phenomena.

7. Further, the ordinary radiometer ceases to act in a strong magnetic field.

Electrical War Devices.

The microphone is now being experimented upon with a view to making it available for detecting the approach of a hostile force while the latter is yet some distance away and far beyond ordinary hearing. The microphone will magnify the sound of the footsteps of a fly until it is almost as loud as the noise made by a man's feet. In its proposed modifications it will attune itself to the vibrations made by the feet of distant soldiers on the march and thus betray their presence and their probable numbers to the pursued or pursuing army possessing such a valuable instrument. A great change has taken place in the sapping and mining department of the army since electricity was introduced on a practical basis. Mines are now laid by the engineer corps and exploded with a far greater degree of nicety than when slow-burning fuses were used. Rivers can now be guarded almost by one man, stationed where he can operate a circuit in which a number of submarine torpedoes are included. The torpedoes used in the army differ from those used in the navy. The latter include a propelling apparatus which carries them through the water; those used in the army are generally anchored at the bottom of a stream. Given a number of torpedoes, judicially placed, a single officer could make the passage across a river by an army a decidedly hazardous undertaking. The value of electric firing as far as the guns themselves are concerned is admitted, particularly on shipboard or for coast defense. There is no lost interval of time between the command of the gun captain and the actual exploding of the piece. The instant the gun is to be fired the officer connects the circuit and the ball is on its way to its destination. If the object aimed at be a distant vessel, rising and falling with the waves, or a moving body of cavalry on land, the value of an instant discharge can be easily recognized. The possibilities claimed for the balloon of the future are dazzling. For instance, army officers say that there is nothing improbable in the supposition of a general of the future using a balloon as a point of observation and transmitting his orders by wire to his army beneath his feet. An officer with everything thus under his eye could be in electric communication with every gun on the field, just as the commander of a man-of-war in his conning tower is able to personally operate every gun on his ship.

The Place of Electricity in the Chemical Industries.

In a lecture recently delivered by M. Moissan before the Conservatoire des Arts et Metiers, he prefaced his remarks by saying that the future of electricity lay, not in lighting and distribution of power, but in those lines in which there was nothing comparable, such as telephony, surgery, medicine and particularly electro-chemistry.

In the lecture it was stated that the temperature of the voltaic arc remained constant, being about 5400° Fahr., independent of the number of watts. By means of this heat, generated by the current from a fifty-horse machine placed at his disposal, M. Moissan produced quarter-pound ingots of chromium, manganese and uranium respectively. This was compared with the method by which these metals were formerly prepared in a free state and sold at a price gradually cheapening from that of the same weight as diamonds.

The lecturer then described the calorimetrical methods adopted by Mr. Violle in determining the temperature of the arc, and ended by describing this method applied to the manufacture of artificial diamonds. This is as follows: After producing in his electrical furnace an ingot of iron, carburetted to saturation, he plunged it into a vessel of water. The great temperature prevented the water boiling, but making a coating of gas around the ingot, which protected the iron from contact with the water. Graphite was first formed, then dense, drawn-out carbon, then black diamonds with a crystalline form, and finally true diamonds having all the characteristics of the natural stone, the faculty of absorbing and holding light, the crystalline form and the great density.

Electric railways in the United States in the last ten years have increased from 13 to 850. There were last year 23,000 electric cars and over 9000 miles of track, the whole system representing a capital of $400,000,000.

Power developed by the Niagara Falls electric plant and transmitted to Buffalo, N. Y., will cost $36 per H. P. per year.

Mechanical Progress.

Figuring the Capacity of Boilers.

As no method has been devised for testing the evaporative capacity of a boiler without the furnace on which it is placed, all so-called tests partake more or less of the nature of guesses, as it is impossible to tell with any degree of exactness, whether the results obtained, favorable or otherwise, are to be credited to the design of boiler or furnace. To this uncertainty is probably to be ascribed the well known discrepancy in the size of boilers offered by different makers when any particular capacity is called for, which again has led to the now common practice of laying down specifications of size of shell, number and diameter of tubes, etc., when bids on boilers are called for. The boiler maker thus becomes merely a mechanic, whose whole duty it is to assemble the materials called for and put them together in a workmanlike manner, and being thus to a great extent relieved of responsibility, is expected to lower his price proportionately. While this may be satisfactory to some who would rather use their muscles than brains, it discounts ability and so is disliked by those who, from close study and long experience, consider themselves fitted for better things.

In a recent case where bids were asked for a number of boilers for a municipal plant, instead of specifying the heating and grate surface to be furnished per horse-power, there was stated the amount of water to be evaporated, the quality of the steam, *i. e.*, its dryness as shown by the calorimeter, and the efficiency to be reached, with the kind of coal it was the intention of the city to use. This new departure would seem to be worthy of an extensive following, as it places the responsibility of the design of boiler and furnace where they belong without dividing it between designer and builder as the other plan does.—F. Riddell in The Boiler Maker.

Water Scoops for Railways.

Railways have for a long time made use of water scoops, let down into troughs set between the rails, to refill engine tenders without stopping trains. Such devices, it is claimed, have never been entirely satisfactory, because water could not be taken in this way without running slowly. If the speed were too great it became impossible to lift the scoop from the water, and in consequence it was smashed against the end of the trough. The Pennsylvania Railroad has since the middle of 1894 adopted as standard a device, in which it is claimed the power required to lift the dipper from the water is entirely independent of the speed of train.

This result, to speak generally, is arrived at by balancing the lower curved portion of dipper near its center

on trunnions about which it turns within limits. The upper end of this dipper is connected with the uptake pipe by a joint supported on another pivot.

The force of impact of water on the lower half of dipper tends to hold it down, while the similar force acting on the upper half tends to lift it. It is stated that these forces practically balance each other, and that trains have, with this device, taken water at a speed of seventy miles per hour, filling a 3,000 gallon tender in nine seconds.

The advantages claimed are easy manipulation, and no lost time, less water wasted by being splashed out of trough, and more water taken per 100 feet of trough, which can therefore be shorter and cost less for construction and maintenance.—Railway Gazette.

The Mammoth Globe at the Paris Exposition.

The project of M. Borgel-Court to construct at the Paris Exposition of 1900 an enormous structure in the form of a geographical globe of 150 meters in diameter quite casts into the shade both the Eiffel tower and the Ferris wheel. Those who visited the Paris Exposition of 1889 remember the globe there shown, which, however, was only about 42 feet in diameter, one millionth of the earth's diameter, and was intended solely as a geographical exhibit.

The proposed monstrosity, as described and illustrated in *La Revue Technique*, however, is a far different affair. It is to contain upon its five interior floors representations of all the various countries in the world. The visitor is to be transported by electric railways from one country to another in such a manner that, in traversing the interior of the structure, he will practically visit every country on earth (apparently with the exception of Germany), finishing, of course, at a restaurant on the platform on top.

The entire cost of the proposed globe, including the expenses of operation during the exposition, is estimated at 10,000,000 francs.

Engineering, London, pays a handsome tribute to machine tools made in the United States, saying: "It is not a reassuring thing for those who would see the engineering supremacy of this country maintained to notice how certain American firms have ranged ahead of us in the production of a light class of machine tools, of which bicycle making machines afford an example."

Practical Information.

Olive Green Squadron.

Olive green will be the fighting color of the new ships of the navy of the United States. That is the decision arrived at by the Navy department officials, and, were war now to be declared, every cruiser and battleship in the fleet would be dressed in an olive-green tint inside of thirty-six hours. Olive green has been found to be the color least visible at sea. There are other colors which would be more suitable for certain operations, but for all-around work the shade selected is deemed the best adapted. The Cushing demonstrated, under the powerful rays of the searchlight, that white was readily picked up. On the other hand, a black object was less easily detected by the searchlight than a white one. A black object is probably the least difficult for a lookout to discover when scanning the water on a dark night, and when depending entirely upon his eyes. During the late war the ships of the Union fleet were, during the closing years, painted a drab. This idea was taken up from the blockade runners. The latter, in steering into the mouth of a harbor, were often able to discern the black hulls of the blockading ships long before the blockade runner could be made out. For day work at sea a drab color has many advantages. It more closely approaches to the shade of the atmosphere, and to the tone of the horizon backing the ship. But at night the searchlight readily makes out a drab-painted object. The olive green which has been selected for the new navy ships is not only difficult to make out by day, but experience shows is the hardest known color to discern at night, when under the searchlight rays.

The torpedo boats' commanders are particularly interested in the subject of ship paints. It means much to them, whether or no their vessels are discovered by the enemy's searchlight when at a distance of 1500 yards from the enemy or at 700 yards. The earlier the charging-on torpedo boat is discovered, just that much longer will she be under fire. During the fight with the insurgent Admiral Mello in 1894, the loyal ships of the Brazilian navy were painted a greenish shade. The torpedo boats which attacked the rebel Admiral's flagship, the Aquidaban, were enabled by reason of their green-tinted hulls to approach within 400 yards of her before being discovered. The remaining charge home space was of such short duration that the Aquidaban was torpedoed before she could beat off her assailants. The new paint color is not to be applied to the sides of the warships by any method of guesswork. The exact proportion of the mixture has been accurately determined, and is so issued to the commanders of warships. The white squadrons are conspicuous, pretty objects in peace time, but, presto, all will change when it comes to war.

Abandonment of a Social Experiment.

The London *Times* says: "Two schemes for insurance against want of employment have existed for two or three years past in Switzerland, one in the canton of Berne and one in that of St. Gall. The former was voluntary, but in St. Gall the laborer was compelled to insure. The American consuls at Chemnitz and St. Gall have both recently reported on the subject, and the former states that men whose work is steady and likely to continue so complain bitterly that they are compelled to support in idleness others whose labor is uncertain, but who, for that reason, are better paid when they are at work. 'It is not in the nature of things for such a system to succeed, even among so loyal, loving and gentle a folk as the Swiss. The effort is not vain if it will teach the thoughtless how hard it is to make laws, or to institute any system that is to take the place of thrift and economy during the days when work is plentiful.' Some time after this report the consul at St. Gall wrote that the experiment had been abandoned at the instance of the laborers themselves. He says they 'found that a system which insured against loss of work resulted in the promotion of laziness and idleness. In fact, a knowledge of the existence of this system of insurance had drawn to St. Gall a considerable number of unemployed from other parts of Switzerland, with the object of obtaining support at the expense of resident laborers.' Hence the system disappears on and after June 30 next."

J. D. VARNEY, in a paper in the Journal of the Association of Engineering Societies, describes one of the latest devices for determining the meridian from the position of the sun without computation. It consists of the usual transit-theodolite, with one attachment and one modification. The modification is that the telescope is carried in a tube which is connected to the horizontal axis in the same manner that the telescope usually is, and is free to revolve in this tube about its own axis. The attachment is a mirror revolving on an axis attached to a small ring which fits on the object end of the telescope. Slow motion is provided for. The mirror is set with the aid of the horizontal circle and a special target, so that it reflects the line of collimation at an angle equal to the angle between the earth's axis and a line from the earth to the sun, (*i. e.*, ninety degrees—sun's declination). The telescope is set at an angle of depression equal to the latitude of the place. The instrument is revolved about its vertical axis, and the telescope about its own axis, until the image of the sun appears in the cross hairs, and then the instrument is pointing in the meridian. The writer claims that with due regard to refraction and hour angle a meridian of sufficient accuracy for all ordinary work can be obtained.

THE degree of danger that may exist in eating the flesh of poisoned animals has been investigated by Lewin, whose experiments have been described to the Medical Society of Berlin. The flesh of a fowl that had been killed by three grains of strychnine was fed to a dog, which became ill on eating half a pound, and was seized with tetanic convulsions and died after consuming a second portion. Some animals are not readily affected by certain poisons. For example, fowls proved very tolerant of strychnine, goats of hemlock, partridges of arsenic, rabbits of nicotine. It is concluded that, even where the animals that have swallowed poison did not seem to have suffered inconvenience, the flesh may be unsafe food for man.

ACCORDING to *l' Echo des Mines*, of Paris, the longest suspended wire in the world is in Switzerland. The wire has just been stretched across the Wallenstadt lake in the canton of St. Gall, by the Swiss telephone administration. This wire is suspended from two iron towers erected for the purpose, the distance between these supports being 2400 meters. At the lowest point it is 40 meters above the water. The wire is of steel of the best quality and is 2 millimeters in diameter.

THE prehistoric monuments of France, England and Germany have been carefully recorded. The first American archæo'ogical map is that of Ohio, on which, in three years, the curator of the Onio Archæological and Historical Society has located more than 5000 village sites, mounds, fortifications and graves, while probably 10,000 remain to be put down.

Cripple Creek—Its History to Date, Illustrated. Just out, with correct map and costly full page views natural as life. This great book will be sent free prepaid with our big 56-col. family paper 3 months on trial for 25c (stamps or silver); club of 5, $1. Latest mining news. Two Big Bargains!

STEAM SHOVEL
FOR SALE.

First-class machine; nearly new; ample power to handle anything but solid rock; cost $7000; was set up but never used; will be sold for $2000; can be bought with or without 50 H. P. boiler.

—✦—

A Bennett Amalgamator.

Cost originally over $7500; in fair condition; can be bought for $1600. For particulars as to capacity, location, etc., address

SPOT CASH,
Mining and Scientific Press Office,
220 Market Street, - - San Francisco, Cal.

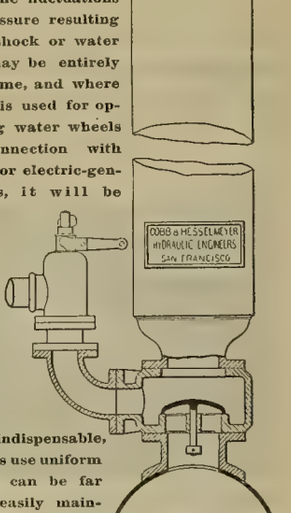
WANTED—A POSITION

By a practical mining engineer as superintendent of a gold or silver and lead mine. Twenty years' experience in mining, milling and concentrating gold, silver and lead ores in California, Nevada, Utah, Idaho, Montana and Colorado. Highest recommends from leading mining companies in above States. Would like to sign a contract for two or more years to go to Mexico or South America. Address "Practical Engineer," Box 21, Mining and Scientific Press office, San Francisco, Cal.

WANTED.—Foreman to run a copper blast furnace, oxidized ores, in West Australia. Salary $175. Expenses out paid. One year engagement. Address ALFRED ROPP, Selby Smelting Works, Selby, Cal.

E. E. BURLINGAME'S ASSAY OFFICE AND Chemical Laboratory. Established in Colorado, 1866. Samples by mail or express will receive prompt and careful attention. Gold and silver bullion refined, melted and assayed or purchased. Address 1736 and 1738 Lawrence Street, Denver, Colo.

INTELLIGENT STEAM USERS
Appreciate the value of a well-informed engineer.
THE HOW AND WHY OF MODERN STEAM ENGINEERING.



JUST PUBLISHED.

THE PRACTICAL MANAGEMENT OF ENGINES AND BOILERS.
INCLUDING
Boiler Setting, Pumps, Injectors, Feed Water Heaters, Condensers, Indicators, Safety Valves, Slide Valves, Governors, Steam Gauges, Incrustation and Corrosion, Boiler Explosions, Belts, Etc.
A Practical Guide for Engineers and Firemen and Steam Users Generally.
By W. BARNET LE VAN.
Fully illustrated, over 200 pages, 4x6½ inches.
PRICE, $1.00.
☞ *Catalogue of books on Steam and the Steam Engine Mechanics, Machinery, Mechanical and Electrical Engineering, sent free.*

Practical and Scientific Books,
19 S. Ninth Street, - Philadelphia, Pa.

Rare Business Opportunity.

FOR SALE!
An Old Established Second-Hand Mining Machinery Business and Machine Shops in Colorado.
The Largest in the State. Carries a $35,000 stock. The present owner wishes to retire or take in an active practical partner, so that he can devote all his time to his mining interests. The three houses are located in Cripple Creek, Leadville and Denver, Colorado, in good hands. The business will easily pay a hundred per cent a year.
FOR PARTICULARS, APPLY TO
THE DENVER MINING MACHINERY CO.
CRIPPLE CREEK, COLORADO.

APPARATUS
—FOR—
Regulating Pressures
—IN—
PIPE LINES

By the use of this device, the fluctuations of pressure resulting from shock or water ram may be entirely overcome, and where water is used for operating water wheels in connection with hoists or electric-generators, it will be found indispensable, as by its use uniform speeds can be far more easily maintained, and all danger of injury to pipe line will be obviated.

Patent Allowed.

For Full Particulars, write to

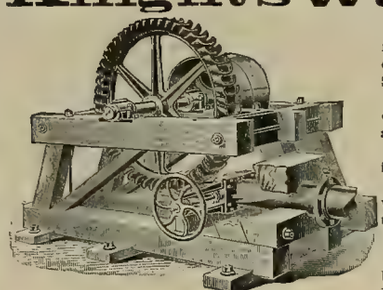
Sole Agents for the Pacific Coast for the W. S. Tyler Wire Works Co., manufacturers of **Steel and Brass Wire Battery Screens.**



Agents for Baker & Adamson's Chemically Pure Acids. A full stock always on hand.
Nitric Acid, sp. gr. 1.42; Muriatic Acid, sp. gr. 1.20; Sulphuric Acid, sp. gr. 1.845.
PRICES ON APPLICATION.

TUBBS CORDAGE CO.

(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice
611 and 613 FRONT ST., San Francisco, Cal.

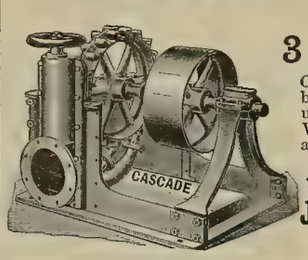
Knight's Water Wheel.

The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel**, of which there are **hundreds in use** in different States of the Union.

These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**



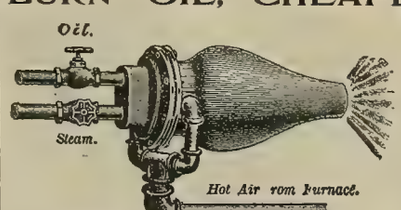
For full particulars, send for descriptive catalogue.

Address all communications to
KNIGHT & CO., Sutter Creek, Cal., or,
RISDON IRON WORKS, Agents, San Francisco, Cal.

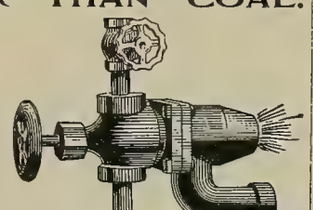
TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.



Our experience of **33 YEARS** building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.



Send for a Pamphlet of either Wheel and write full particulars.

JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

BURN OIL, CHEAPER THAN COAL.

THE THURMAN FUEL OIL BURNER CO., When Building, INDIANAPOLIS, INDIANA.
Designers, Contractors and Engineers for Complete Fuel Oil Equipment for Boilers, Furnaces, Ovens, Brick Kilns, Forges, Driers, Etc. **Acknowledged the Best. Absolutely Smokeless.** We Guarantee Our Burners To Be More Economical Than Any Other. Write For Catalogue and Prices.

TUTTHILL Water Wheel.

The Latest and Best Jet Wheel in the Market, BARRING NONE.

WHEELS, BUCKETS AND NOZZLES DESIGNED TO SUIT SPECIAL REQUIREMENTS, WHEN HEAD AND CONDITIONS ARE GIVEN.

THEORETICALLY AS WELL AS PRACTICALLY PERFECT. HIGHEST EFFICIENCY GUARANTEED.

CONTRACTS TAKEN FOR ANY SIZE PLANT.

We have a Sensitive, Simple and Durable Governor, entirely new and novel, that will positively regulate speed of wheel. Specially adapted for electric railway and lighting plants.

Coast Industrial Notes.

—The editor of the Gold Creek, Nevada, *News* has sent some of the wood called mountain mahogany to the East to be tested as to its value for wood type.

—Next to the United Kingdom, Mexico bought more United States machinery in November, '96, than any other nation. The sales amounted to $342,884, against $141,147 in November, '95.

—The Los Angeles, Cal., *Investor* says the Watsonville beet-sugar factory has now the world's record for the largest production of sugar in one season, having already produced 18,881 tons of sugar and cut 150,653 tons of beets.

—The Wood River, Idaho, *Times* says the new Nampa & Silver City Railway is completed to the Snake river—twenty-two miles out from Nampa—and ready for traffic. The other forty-one miles of the road are to be completed by May 1st.

—From the State of Nevada during December and January, to different points in California, there were shipped of cattle, 390 cars containing 7660 head; sheep, 195 cars containing 19,045 head; calves, 3 cars containing 135 head; horses, 3 cars containing 44 head; hogs, 12 cars containing 966 head.

—Word comes from Anaheim, Cal., that three new oil wells are being sunk near Placentia to supply fuel for the sugar-beet factory at Los Alamitos. The wells in operation at Puente are being taxed to their utmost in furnishing fuel for the Chino factory, which consumes 1000 barrels a day during the working season.

—The Truckee and Lake Tahoe Railroad Company has incorporated to connect the town of Truckee with the northern shore of Lake Tahoe at or near Tahoe City, seventeen miles. W. S. Bliss of San Francisco, M. L. and I. L. Requa of Oakland, D. L. Bliss and W. D. Toby of Carson City, Nev., are directors; capital stock, $208,000; $20,000 subscribed.

—For San Diego is proposed a new telephone system, not only covering the local field, but connecting with Los Angeles, Riverside, San Bernardino, Redlands, Pomona and Pasadena. The promoters are business men of Los Angeles, who have organized into a corporation known as the Home Telephone Company, with a capital of $500,000, divided into 50,000 shares.

—Twenty-two thousand acres of land, formerly belonging to the Semi-Tropic Land and Water Company, have been transferred at Los Angeles by the San Francisco Savings Union to a company of English capitalists. The price was over $500,000. Two thousand acres lie in the Rialto irrigation district. One tract of 2000 acres will be cleared at once for planting canalgre.

—Thirteen million feet of American lumber were imported into China last year. According to United States Consul Jernegan at Shanghai, most of this came from Washington and Oregon. The Chinese have completely denuded eastern China of its timber and are now drawing upon ours. Recent stimulation of mill building in China and the growing liking of the natives for foreign style houses have led to much of this demand.

—The Southern California Power Company has been organized in San Bernardino, Cal.; capital stock, $1,000,000; principal stockholders, H. Fisher, Pittsburg, Pa., and H. H. Sinclair, Redlands, Cal.; to develop power from the Santa Ana river, to be transmitted by pole line seventy-five miles to Los Angeles, for lighting and railroad companies. If it goes, it will be the longest line and handle the highest voltage (30,000 volts) in use in the world. It is intended to begin work about April 1, 1897.

Personal.

AUG. J. BOWIE, JR., son of Aug. J. Bowie, has returned from the East, and will begin the practice of his profession in this State. Mr. Bowie graduated with honors at Harvard, and later at the Massachusetts Institute of Technology, took degrees in both electrical and mining engineering at the same time, and with honors, the first time this has been done.

AT the twenty-seventh annual session of the American Institute of Mining Engineers, held in Chicago last week, the following officers were elected: President, George S. Brown, South Bethlehem, Pa.; vice-presidents, D. W. Brunton, Aspen, Colo., W. E. Eustis, Boston, James Douglas, New York City; managers, C. W. Goodale, Butte, Mont., Frank Lyman, Brooklyn, Frank M. Stanton, Houghton, Mich.; treasurer, Theodore D. Rand, Philadelphia; secretary, Rossiter W. Raymond, New York City.

THE Governor has appointed A. S. Cooper of Santa Barbara State Mineralogist, to succeed J. J. Crawford, whose term has expired. Mr. Cooper has been a resident of Santa Barbara for thirty years and has devoted his attention largely to developing the asphaltum beds. He is a native of Maryland, and came to California in 1852. He lived in Columbia, Tuolumne county, when a boy, and went to White Pine, Nev., in 1869 as an assayer. Since 1870 he has practiced the profession of civil engineer, hydraulic construction, mine surveying, etc. In 1872, in connection with others, he opened a quicksilver mine north of Santa Barbara. He has recently been engaged in running a 1000-foot tunnel in the sandstone of the Santa Ynez mountains to acquire water for the Santa Barbara municipality.

Commercial Paragraph.

THE Mazapil Copper Company of Saltillo, Mexico, has given a contract to the Colorado Iron Works of Denver, Colorado, for three elliptical bowl slag trucks. The same company will furnish a double pot slag truck for the Compania Minera Fundicion y Afendora of Monterey.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1897.

BRADLEY PULVERIZER CO. *Gentlemen*:—The two Griffin Mills have been in operation now for 70 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker and they average about 20 tons to each machine, 40 mesh fine, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills**. We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisbie Lucop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DELAMAR.

HOW 10 GRIFFIN MILLS WORK.

DELAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

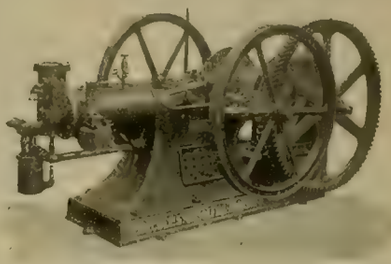
BRADLEY PULVERIZER CO. *Gentlemen*:—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager*.

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.



HERCULES GAS, GASOLINE AND DISTILLATE ENGINES.

HOISTING ENGINES, 2 h. p. to 200 h. p. ✦ STATIONARY ENGINES, 1 h. p. to 200 h. p. ✦ MARINE ENGINES, 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ¼ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.

NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim **full power, automatic and positive adjustment regulating speed and consumption of fuel** in proportion to work being performed. **No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.**

Millwright and Engineer.

Contractor for the erection of Stamp Mills, Roller Mills, Reduction Works, Saw Mills (both circular and band), Aerial Wire Rope and Surface Tramways, etc., etc. Putting in machinery, shafting, etc., of all kinds promptly attended to. Estimates given on plants, complete, including machinery, building material, etc.

KENDALL GOLD AND SILVER EXTRACTION CO.

THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."

Owners of mines and reduction works can obtain full information on application to

KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

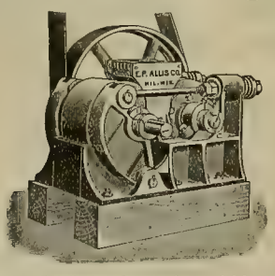
The Tutthill Water Wheel.

In the jet propulsion wheel herewith illustrated, designed by S. J. Tutthill, of San Francisco, and manufactured by the Oakland Iron Works at Oakland, Cal., the impelling stream is not divided on striking the bucket, but entering tangentially to the curve of the bucket is entirely deflected in one direction alternately to the right and left with each succeeding bucket, thus, as claimed by the designer and manufacturers, "reducing to a minimum all tearing or separating of the stream, and incidental wasteful production of heat instead of work, while the alternating of the bucket discharge between left and right gives large clearance for the falling of the more or less completely spent water, and permits the nearest approach to a complete reversal of the direction of the stream without backwash. Any gain in clearance thus effected of course admits of a greater capacity for receiving water, and consequent greater output of power for a wheel of given diameter and speed.

"The shape of the discharge lip of the bucket is a radical departure from other makes, and is a recognition of the requirements of theory in accomplishing the reversal of the stream and absorption of its energy without serious loss incident to the impact resulting from the distorting of its section.

The usual flattening of the stream's section, and the discharging of it in a thin sheet along a lip of considerable length is in buckets of such a type a cause of very considerable loss of energy.



"In addition to the above points, the designer has given special attention to the form of the nozzle employed, and has adopted a form simple in design and directly in accord with the requirements for high efficiency as determined by scientific hydraulic investigators."

They conclude by saying: "It is evident that the successful embodiment in practice of the true theory for the correct design of impulse wheels, as accomplished in this particular wheel, must result in an unusually high degree of efficiency; and while no precise tests have as yet been completed for determining the degree of efficiency obtained, the results of approximate tests made on some of the considerable number of wheels already in use clearly indicate this to be another illustration of the truth of what should be an axiom among engineers, *i. e.*, the best practice is always the most perfect embodiment of sound theory."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEBRUARY 16, 1897.

577,225.—FRUIT JAR—S. S. Black, Pasadena, Cal.
577,349.—TWINE HOLDER—F. Bossong, Ellensburg, Wash.
577,353.—FRUIT GRADER—W. Brown, Portland, Or.
577,356.—SLUICE BOX—C. A. Christensen, Oretown, Or.
577,312.—ANIMAL TRAP—D. S. McCollum, Keno, Or.
577,145.—BEDSTEAD—C. E. McKeag, Los Angeles, Cal.
577,200.—ROWING DEVICE—J. Nordwall, Seattle, Wash.
577,062.—TRANSOM LOCK—G. M. Parsons, Carson, Nev.
577,070.—PAPER MOLDS—H. Sandham, Spokane, Wash.
577,274.—THILL COUPLING—J. U. Tabor, Los Angeles, Cal.
577,275.—FRUIT SLICER—M. Welch, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ADJUSTABLE TRUCK.—Elias Ireland, Winters, Cal. No. 576,729. Dated Feb. 9, 1897. This invention relates to an improved truck which is especially adapted to be used in connection with an apparatus for bleaching fruits. It consists essentially of a truck having a vertically movable frame or body and means by which it may be raised or depressed at will so as to raise the platform-carrying trays from their supports in the bleaching house and transfer them to other points where they are left by the depression of the car frame. The movable frame is mounted upon the truck by means of arms having rule joints which connect the frame directly with the arms and a lever is fulcrumed upon the main frame, having its lower end connecting with a bar which is loosely journaled to the rear axle of the truck so that by the movement of the lever the frame may be raised or depressed.

TROLLEY SYSTEM.—W. G. Caffrey, Reno, Nev. No. 576,721. Dated Feb. 9, 1897. This invention relates to the general class of electrically propelled vehicles and to trolleys and electrical conductors, and it consists in a novel construction of the trolley and means for adjustably securing it to the vehicle. A positive and negative conductor are arranged in vertical plane, one above the other, and a trolley to travel in contact with the conductors, consisting of pivoted bars forming an extensible and contractible frame, slotted plates in which the frame bars are guided, contacts carried by the plates and removable and reversible arms pivoted to the plates with strings for holding their contacts up to the conductors. The extensible and contractible trolley, with its rollers and the cross rods on which the pivoted bars are guided, operate in conjunction with the trolley pole or cable and having a double joint between the pole or cable and the cross rods.

LAMPS.—Emile Boesch, San Francisco, Cal. No. 576,716. Dated Feb. 9, 1897. This invention relates to certain improvements in car lamps of that class which is adapted to be fixed in the side or end of a car so as to give light to the interior and exterior. It is also applicable to light streets or houses with various forms of burners known as argand or chimney burners, either for oil or gas. In the lamp fixture the body consists of a hollow vertical or side reflector, an extension chimney to which it is connected, said body having feed and exhaust passages and an air chamber on top, a removable fount having its lower part fitting into and over the said air chamber and provided with a burner and a glass chimney fitted to the burner, having its upper part fitting within the chimney extension. An air passage is made behind the reflecting surface and the lower part of the body projecting into the car forms an air chamber in communication with this passage, the chimney extension forming a communication to supply air to the passage.

Gold, Silver and Copper Ores and Sulphurets

BOUGHT AT HIGHEST MARKET PRICES.

SPECIALTY, COPPER ORES.

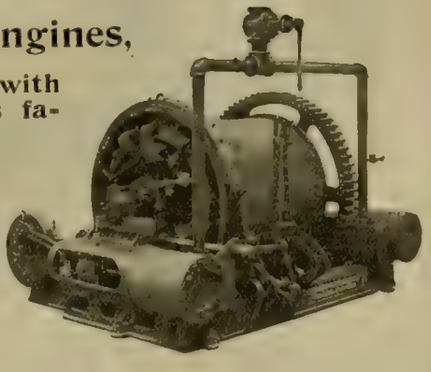
RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.



FRASER & CHALMERS,

Chicago, Illinois,

Have brought out a new line of medium size

Steam Hoisting Engines,

These are designed with great care by engineers familiar with the best previous practice, and knowing just what is wanted to render satisfactory service on a mine. Do you want such service? Then buy one of these improved machines.

Other Special Lines of Manufacture

On which we would be glad to quote are

Stamp Mills, Shoes,
Smelting Furnaces, Dies,
Cyanide Plant, Cams,
Ore Crushers, Rolls,
Frue Vanner Concentrators, Jigs,
Brown Roasting Furnaces,
Huntington Mills,
Perforated Metals and Screens,
Corliss Engines,
Adams Boilers,
Riedler Air Compressors & Pumps,
Otto Aerial Tramways.

Qualified by a Quarter Century of Experience to render you the best of service, we invite your inquiries and patronage.

Assaying Gold

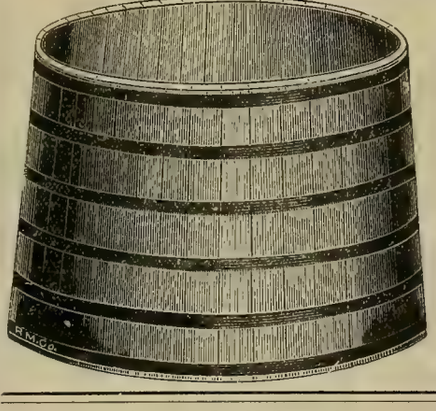
.....AND.....

Silver Ores.

A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.



This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 25, 1897.

With more settled weather and improving roads, business begins to enlarge, but no decided increase is looked for until after tax assessment day, when money will be offering more freely and dealers will not fear to stock up. The prevailing feeling with foundrymen and iron workers in general is that they will handle more orders this year than they did in 1895. They look for a large increased call for mill machinery, structural material, farm implements and different kinds of railroad material and machinery of all kinds for other industries and purposes. The low prices ruling for raw material is quite an incentive and admits of making lower bids on all kinds of work. Aside from this there is a strong probability that increased duties will be put on under the incoming administration, which will cause higher prices for imported raw material that will help those who laid in heavy stocks, until they are used up, before the increased duties.

In the local money market there is nothing new to report. After a week or ten days money will be offering freely, and, it is said, many persons and firms will avail themselves of the opportunity to get accommodations for new ventures or else to prosecute old ones. The premium on New York exchange has held firm, but towards the close the tone is easier. Before the close of March the premium on Eastern exchange will probably be gone and sales at par be the order. It is stated that new capital will soon begin to come in for investment, particularly for gold mining properties. Several sales are already being negotiated, which, it is thought, will be closed by the end of March. The railroads, it is reported, will make heavy disbursements for improvements, extensions, relaying of rails and new supplies. The East continues to report an easy money market, although it is noted by New York exchanges that more commercial paper is coming out, which is accepted as a favorable sign that the turn for the better has set in. Our New York correspondent writes: "A good authority on the money market says that there is getting to be more tone to the market for time loans, and he is of opinion that a gradual advance in the value of money may be looked for in the next few months. He bases this opinion first on the fact that a general improvement is unquestionably under way; which will gain strength as time goes on and cause a good demand for money from merchants and manufacturers. Secondly, he says that leading capitalists and other powerful interests have provided themselves and are still providing themselves with money in large blocks, according as opportunity offers. There is, of course, a plentiful supply of money for all needs at present, and there is likely to be plenty for some time to come; but an investment in long time loans just now, it is thought by many, might prove profitable.

New York Silver Prices.

NEW YORK, Feb. 25.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 11-16	64⅛
Saturday	29 11-16	64⅛
Monday	29 11-16	* ....
Tuesday	29¾	64⅛
Wednesday	29¾	64 13-16
Thursday	29¾	64¾

*Holiday.

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 25	10 25@12 50	13 45
Saturday	12 00	3 25	10 25@12 50	13 45
Monday	*	....	.....	.....
Tuesday	12 00	3 20	10 25@12 50	13 35
Wednesday	12 00	3 25	10 25@12 50	13 45

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	25c Prem
New York Telegraphic Transfer	27½c Prem
London Bankers' 60 days	$4.86¼
London Merchants	$4.85
London Sight Bankers	$4.88½
Refined Silver, per oz., 1000 fine	64⅝
Mexican Dollars	51½@52

SILVER.—The market towards the close has strengthened slightly, in sympathy with better prices abroad. The improvement in London is said to be due to an increased call from India and the Straits. It is the impression abroad that China will soon come in as a freer buyer. In our market there is a continued fair export demand. The last steamer for China took out 32,000 ounces for Hongkong, but none for Japan.

MEXICAN DOLLARS.—The market has held to fairly good prices, but towards the close it is firmer, in sympathy with silver. The last steamer for China took out 188,676 dollars.

COPPER.—The market is practically unchanged. At the East there is a continued free outward movement, but increasing production in this country seems to be against an advance. The consumption in the United States is steadily enlarging.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	—@13½
Sheet copper	—@17
Bolt	½ & 5-16, 20c; ⅜ and larger, 17c

QUICKSILVER.—The demand is fair. It is stated that about all the outside holdings have been taken off the market. New York advices state that the market is strong at $37.50@38 per flask. Our market is quoted at $38 per flask. The export market is unchanged.

BORAX.—The outward move by water and rail is quite large. The last steamer for Panama took out over 50 tons for New York. Powdered is higher, and other sorts lower.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5¼
Powdered, in car lots	5
Concentrated, "	4½

LEAD.—The market is firm at full figures, with the tendency to still better figures. The consumption abroad is steadily increasing, and it is expected that it will soon begin to enlarge in this country.

Our market is quoted in jobbing lots as follows:

Pig	3 75	@	3 85
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a stronger tone to the market.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—Pig is steady, and plates irregular. Canners on the Columbia are getting their supplies from the East. In our market American is also finding quick sales. At the East it is said that there is still more or less cutting. The markets abroad are fairly steady.

We quote as follows:

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	$4 05@ —
" " " light, "	3 95@ —

IRON.—There is a fairly liberal spot stock of foreign pig on hand, with few shipments on the way. The very low prices ruling for American at the East is against foreign. The consumption in this city promises to be very heavy this year.

The Cleveland Ohio, *Iron Trade Review* says: Cheap raw materials in 1897 may prolong the present level, or something near it; but more regular operation of mills, when it comes, will at least bring more economical production, if markets are not materially higher. Structural steel has taken no noticeable start. The money requirements of the rail-buying campaign would tend to stiffen rates slightly on the projectors of building enterprises, but there seems no disposition to push matters, even under the present tempting discounts. From the Birmingham district comes reports of better sales in the week, one Southern pipe works having placed a fair order, while contracts of from 1000 to 3000 tons for foundry grades are noted. Foreign demand keeps up and recent transactions have netted 50 cents a ton more than sales for home consumption. A small sale of No. 1 foundry for shipment to Chili was made at $8.50, furnace.

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—Large consumers and handlers do not anticipate wants beyond near-by months. They believe that, with a continuance of present brilliant wheat crop prospects, importations of coal will be heavy. Fears are entertained that the duty will be increased.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 50@ 6 00

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is fairly steady both here and at the East.

Our market is quoted at 7⅛@8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6¾@6¾c for Hallett's and 6½c for Japanese.

POWDER.—The market is unsettled, and, pending negotiations for higher prices, we take out prices. The different companies have combined to advance prices, which we will give next week.

NAILS.—The market is below the cost of production.

Wire, carloads, basis per keg	....		
" jobbing, " "	$2 20		
Cut, carloads, " "	....		
" jobbing, " "	2 00		

SPELTER.—The market is steady with a good movement. The East is reported firm, with a good demand ruling.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The demand the past week was fair. The East reports a slightly improved call.

We quote in a jobbing way at 60 to 65 cents a pound.

PLATINUM.—The inquiry is said to be fair, both here and at the East.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—Dealers report an improved call the past week.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—The East reports an increasing call; our market is steady.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is steady to firm.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

There has been a continued fair demand for the season of the year. The general impression is that quite an increased consumption will rule this year.

BONEASH.—There is a good demand but chiefly for export, with Australia drawing liberally.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is reported quiet but firm at 2½c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is slow but steady at $1.50 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—The market is essentially unchanged. At the East there is continued activity at from $1.87½@1.90 for commercial. Chili advices state that the market is active at $3.90 per 100 pounds for 95%. Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is quiet at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is light. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—Eastern advices state that the market shows more activity. Our market is quiet.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, Feb. 25, 1897.

The market has been only spasmodically active the past week under review. It acts different from any previous movement and therefore is a puzzle to those not informed. Con. Virginia has been used as a lever for working the market; but, judging from how the moves have been, it ought to take a back seat and something else come to the front, for evidently it is hardly time to let the "bottom out" of the entire list, for too many assessments have to be collected within the next few months. Aside from this, the gathering of sports in Nevada to see two persons have a prize fight will afford an opportunity to unload a considerable quantity of shares at a profit on current prices. Whether this will be done the writer has no way of finding out, but it is reported on the street that this is the program. Those who have long experience in stock gambling do not believe that much of a bull movement can be made at that time, and, as for that, at any other time without showing up a body of ore which gives promise of yielding enough bullion to admit of dividends being paid. Moneyed outsiders are not caught as easily as they were in years gone by or before so much notoriety was given to the way in which a large number of the mines have been mismanaged. It is stated that persons connected with the inside pool have succeeded in forming a company and elected directors for the purpose of draining the American Flat mines. It is reported that the company is incorporated under the laws of Nevada. If this is so, then it will probably be run like the Yellow Jacket. This mine does not make reports, or at least none are seen in this city, to the shareholders regarding work or financial standing, owing to the company not having been incorporated under the laws of California, therefore money can be misappropriated and no one outside of the ring be the wiser.

From the Comstock mines the use is not calculated to inspire the hopes of the long-suffering assessment-wracked shareholders, who have visions of untold wealth to be theirs when the powers that be get ready to show up two or more large bodies of ore found years ago but kept in reserve for the future. It is this belief which makes assessments comparatively easy to collect, and has heretofore helped no little in promoting by a bull move. In Utah they are still running an east crossdrift, and with as little prospects of striking ore as at any time within the past quarter of a century. An assessment, and as

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

DYNAMOS FOR ELECTRIC LIGHTING.
D. D. WASS, Electrical Engineer, 56 First Street, San Francisco, Cal.

for that quite a number, is liable to be struck first. In Sierra Nevada there is no change in the work or formation from that reported last week. The same remarks apply to Union, with the exception that in the latter a vast crossdrift has been started on the 900-foot level. The official letter from Mexican reports that in the west crossdrift a light seepage of water is coming in. On the Central tunnel level of Ophir they are opening out some old works. In one of these they have made the big strike of 4 inches of ore assaying $30. It is not reported in the letter if it required a magnifying glass to locate this ore. On the 1000-foot level the west crossdrift is in more favorable formation. On the 1000-foot level of Consolidated Virginia they have suspended work to the west, and started an east crossdrift from the Consolidated Virginia shaft. On the 1550-foot and 1650-foot levels the work seems to be largely preparatory, and therefore uninteresting. More active exploring work ought to be commenced soon.

Nothing of much consequence has been discovered yet. From the 1750-foot level there is nothing new to report. The total extraction of ore last week was 78 tons, assaying over $30 to the ton. There is no change to report in the work in Best & Belcher and Gould and Curry, and also in Savage. In Hale & Norcross work is about the same as reported last week. Chollar is not doing any work. In Potosi they are still fooling away time on the upper levels. In Bullion the long north drift is being pushed slowly ahead. It is said that slow progress is made so as not to strike ore. And it is said the same persons that control this mine want to get control of Hale & Norcross. No work is being done in Julia or Exchequer, outside of the laborious duty of collecting an assessment by the former. In Alpha they continue to experiment how not to find the west lode. They have, so far, been a great success at it, and will probably continue to be until the inside has frozen shareholders out of their holdings.

Reports to hand state that in the joint west crossdrift run by Con. Imperial, Challenge and Confidence, the formation has changed decidedly for the better. It is softer and looks well. At last advices there was quite a flow of water. The work in Confidence is unchanged. No news from Challenge or Yellow Jacket. The official letters from Belcher and Seg. Belcher have not been changed for the better. Raising of ore is reported, but no particulars are given. Those in position to know say that a big body of good to rich ore is being developed, and that is why the letters do not give any information as to the work. In Crown Point the work is practically unchanged from last week's advices. Advices from Overman, Caledonia and Alta are practically unchanged since our last week's issue.

From the Brunswick lode there is very little of interest to report. Work in Occidental is being done on the several levels heretofore reported. The formation is practically unchanged. In Chollar a good excuse presented itself last week to stop extracting ore, viz: too much snow, but the south drift on the 500-foot level is being pushed ahead. At last advices they were in Chollar ground with favorable formation encountered, but no ore of much value is expected to be struck yet awhile. The work being done by Savage, Best & Belcher, Gould & Curry, is on the same levels and in the same directions reported last week.

The market strengthened this morning under the lead of Confidence, which sold up to $1.05 a share, against 82 cents bid yesterday. The advance is said to be due to some ore or quartz shown at the Confidence office, which, it is stated, came out of that mine from the west lode. There are some who think a Comstock superintendent, who has just returned from Randsburg, brought the specimens. It seems as if "pocket miners" still exist. The Gold Hill mines will have to levy assessments soon.

The following illustrates the changes of the week:

Assessment Notices.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1) of five cents (5c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—210 Sansome street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

POSTPONEMENT.

At a meeting of the Board of Directors of the Mineral Hill Mining and Smelting Company, held on the 15th day of February, 1897, it was resolved that any stock upon which the assessment shall remain unpaid on the 15th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 13th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

CHAS. PEACH, Secretary.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 18th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the date of delinquency of the above assessment is postponed to the 22nd day of March, 1897, and the day of sale to MONDAY, the 29th day of March, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 43) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY. Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 24th day of February, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on FRIDAY, the 26th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on FRIDAY, the 21st day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1897, an assessment (No. 61) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 23d day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room No. 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of February, 1897, an assessment (No. 26) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of March, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 6th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Pluta, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado, send to

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

The Problems of the Rand.

The mine owners of the Rand in South Africa have fallen upon hard times. Between the unreasonable restrictions, monopolies and duties of the Boer Government, and the lowness of the grade of their ore, many of the big mines are finding it difficult to make both ends meet and some have already closed down. Others will soon work out their reefs to such a depth that the difference between cost and production will get on the wrong side, unless the concessions asked for from the Boers are granted. That these concessions will be granted there can be little doubt, for the Boers have no desire to see the mines closed, but unless they change their methods the concessions will be so loaded as to be of little real value.

Much has been done for the mining world in the Rand in the way of introducing cheap methods. Necessity has been the cause of this. Now the great problem with all the mine managers is still further reductions. John Hays Hammond, consulting engineer of the Consolidated Gold Fields who control several of the largest mines, has lately left London for the Rand. His main purpose is to see what can be done in the way of starting up again some of the properties closed down and increasing the profits of others. It is hardly probable that much can be done immediately, except in the way of consolidation. In an interview before leaving London Mr. Hammond said: "If you work your property with a small plant, not only is the aggregate profit reduced but the mere fact that mining is spread over a longer period of time means the enormous loss of interest on the capital invested and upon the gold output as well."

What Mr. Hammond says seems almost self-evident, yet all over the world are mine owners attempting with small plants to duplicate the figures of costs of working in the Treadwell or the Homestake. What has been done in Africa will in time influence mining here largely, especially in the direction of working low-grade ores and sinking to great depths.

The American Flat Tunnel.

It seems probable that the scheme for draining the mines of American Flat by an extension of the Sutro tunnel will be carried out. A corporation is being formed in Nevada, with Virginia City as its principal place of business, which will in a few days file its articles. The name of the corporation is the American Flat Development Company, and the seven directors chosen to form it are H. M. Yerington, W. E. Sharon, J. W. Eckley, H. M. Gorham, E. D. Boyle, Albert Lackey and J. R. Ryan.

The capital stock is placed at $10,000,000, and the purposes of the incorporation, as stated in the articles, give it wide scope for work and include the owning and working of mines, controlling of water supplies and utilizing them, generating electric power and doing any kind of milling or reducing of ores, etc.

It is announced that the work of running an extension from the Sutro tunnel to the Rock Island shaft will be commenced first. This extension, it is proposed, will go through the Alta mine, starting from the shaft, and will be about 7500 feet in length. From the Rock Island shaft a lateral drift is to be run from the Caledonia mine on the north to the Winnie claim on the south. It is understood that the people forming the company control 15,000 linear feet of ground which will be drained by this system of tunnels.

While the first great drain tunnel for mining—the Sutro—was built on the Comstock, there has been much more activity in running similar, although not as extensive, tunnels in other districts of late years, especially in Colorado and Utah. In those States many of the enterprises have been successful and others now in course of construction promise to yield good returns.

NEW MEXICO TURQUOISE PROSPECTORS.

THE CHALEHA, N. M., TURQUOISE MINE.

(See page 192.)

It is to be hoped that this enterprise will be freed from the old unbusiness-like methods that were so much in vogue on the Comstock during its halcyon days. If so, it may instill new life into what has been the greatest of all mining camps. Certainly, the fact that such men as are connected with the scheme have faith in it says much for it.

The Mining Bureau Appropriation.

The Ways and Means Committee of the California State Senate has recommended that the annual appropriation for the State Mining Bureau be cut down from $25,000 to $12,500. This is a poor way to economize. The amount proposed would be nearly all eaten up by the salary of the State Mineralogist, the rent of the Bureau, and the expenses of maintaining the Museum in San Francisco, and very little, if any, would be left for work in the field. The best work done by the Bureau in the past has been in gathering data of value to miners and preparing articles on special subjects, all of which has been printed and supplied free of charge to those desiring it. That there has been a demand for this literature there can be no question; that it has filled a want is shown by the fact that, although larger editions of the Mining Bureau's reports and publications have been printed than those of any other State bureau or institution, they have always been speedily exhausted. Second editions of several of the valuable bulletins have been printed to meet the demand.

The maintenance of the Museum has been of value, partly for those who come to this city and desire to gather information from it, but much more for the use of those connected with the Bureau in preparing their data. If these men can no longer be employed the main object for maintaining the collection of minerals and especially of the laboratories will be gone.

It seems strange that, with all the renewed interest in mining and the importance of the industry to the State, the mining members of the Legislature cannot see to it that the comparatively small appropriation of $25,000 is made. It is the old story—miners ask for and receive from the State less than any other class for their industry.

But little effort made by the Miners' Association or others interested would be necessary to show to the members of the Legislature that the State of California can in no other way make a better investment. It is not as if mining was asking for direct aid, as do so often other industries that are languishing.

To Protect Stockholders.

Up to the first of this week the only bill that was passed by both houses of the State Legislature of California in reference to mining was an act to amend sections 1 and 3 of the act of April 23, 1880, for the protection of stockholders in mining corporations. Section 1 is amended so that the superintendent shall file with the secretary of the company monthly instead of weekly reports.

The third section is amended so that in case the president shall refuse or neglect to give to any shareholder an order to examine the mine owned by the company such stockholder shall be entitled to recover against the president $1000 and costs. In case of the failure of the directors to have the reports and accounts current made and posted they shall be liable, either severally or jointly, to an action by any stockholder in any court of competent jurisdiction complaining thereof, and on proof of such refusal or failure such complaining stockholder shall recover judgment for actual damages sustained by him, with costs of suit. And each of such defaulting directors shall also be liable to removal for such neglect.

TABLE OF CONTENTS.

ILLUSTRATIONS.—New Mexico Turquoise Prospectors; The Chaleha, N. M., Turquoise Mine, 189. Layout of the Keating Factory at Middletown, Conn.; View of Keating Factory January 30, 1897; First Floor of Main Building—Room 1000 Feet Long, 196.

EDITORIAL.—The Problems of the Rand; The American Flat Tunnel; The Mining Bureau Appropriation; To Protect Stockholders, 189. The State Lands; The Debris and Dredging Bills; The Immigration Bill and British Columbia; Good Roads to the Mines; Geology of the Sierras, 191.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 194-5.

SCIENTIFIC PROGRESS.—The Quacks and Electricity; A New Theory; Petrifite, 196.

ELECTRICAL PROGRESS.—Unique in Its Motive Power; World's Submarine Cables, 196.

MECHANICAL PROGRESS.—Improved Method of Filtration, 196.

PRACTICAL INFORMATION.—Pig Iron Production; A Great Railroad Feat; Aluminum Brass, 197.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 206-7.

MISCELLANEOUS.—Concentrates, 191. Turquoise Mining in New Mexico; Copper Refining, 192. Outline of the Geology of California with Reference to Its Mineral Deposits; Recent Additions to State Mining Bureau Exhibits; Mines in Sweden, 193. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations, 199. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 202.

The State Lands.

There should be no further argument required in favor of repealing the act of the Legislature of March 28, 1874, and subsequent acts amendatory of it, providing for the sale of mineral lands in the 16th and 32nd sections, granted by the Federal Government to the State, than is contained in a letter that the Surveyor-General of California has forwarded to Mr. Soward of the Assembly. The act has been declared by the United States and the State Supreme Court void and simply waste material. Yet the Surveyor-General writes that no less than nineteen applicants for patents to 40 acres of land each in the Randsburg district have filed papers in his office under this act. They have no doubt acted in good faith and probably have, some or all, been the original locators. Others, however, who, knowing that such claims are not valid, and that the lands being mineral belong to the Federal Government yet, have located them under the Federal Statutes and local regulations and will obtain title.

In conclusion, Mr. Wright says that to permit the present law to remain in its present form will cause much complication and litigation over mining titles, derived from two different sources under systems so different and so at variance with each other as are the United States law and the State law.

The Debris and Dredging Bills.

The Legislature has passed the so-called debris and dredging bills. The former carried with it no new appropriation—merely reappropriating $250,000 now in the State treasury and making it available. It will be expended under the direction of the United States Debris Commission, with a like amount appropriated by the Federal Government for the building of dams for restraining debris. That the expenditures will be honestly made there can be little doubt, and the fact that the commission has had now several years to consider the questions relating to the debris dams is guarantee that the work will be carried out intelligently and to good purpose.

The dredging bill carries with it an appropriation of $300,000 for dredging the Sacramento river. While it is true that this work should have been undertaken by the Federal Government, this appropriation by the State will no doubt induce Congress at the next session, if proper representations are made, to make as large or greater appropriations, and in the end the State will have made a good investment through forcing the Federal Government to do more than it would otherwise for the Sacramento river. In the meantime, it is to be hoped that the State authorities in charge of the work will do good work. Could they delay fixing upon final and permanent plans until the Federal Government steps in and joins the State in the improvement of the river, probably there would be better returns made with the money.

Good Roads to the Mines.

If any one is skeptical about the advantages of the proposed changes in the system of building and caring for roads in this State, he should take a trip this month up through Calaveras, Tuolumne, Amador or any of the mining counties in which there is activity in that industry and ride over the roads over which supplies and machinery must be taken to the mines. Many of these roads—thoroughfares—leading to rich mining districts are impassable except for very light wagons or buggies. Others will permit the passage of freight wagons with such small loads that the charges are almost prohibitive.

In all the depots on the way to the mines may be seen machinery and supplies held up until the roads improve. In Calaveras there are six mines which one company expected to begin development work in three months ago, but have been prevented from doing so because the roads would not permit the hauling in of the necessary machinery and supplies. In nearly every district along the Sierra Nevadas in which there has been increased activity in mining of late years the roads are so bad that business is at a standstill. Some mines obtained their supplies in season, but many others could not and are consequently idle. The machinery for dozens of mills and for scores of proposed shafts is scattered along the foothills, at railroad depots or part way to their destination on the roadside. Could it all have gone in when ordered there would now be many men employed who are idle and many thousands saved to the mine owners.

This has been an unusually bad year for the roads as far as the weather is concerned, and far worse because of the increased amount of machinery and other supplies that has been required on account of the opening up of new mines. The utter inadequacy of the roads has been shown and it has been a very expensive lesson. It would be safe to say that in many districts the losses entailed directly through the wretched condition of the highways in this one winter would more than pay for the building of good, well-paved and well-drained roads.

The mine owners and the working miners, who suffer through curtailment of employment, should together be able to see to it that the supervisors of their counties do their duty or see that capable and honest men are elected to the boards.

The Immigration Bill and British Columbia.

The veto of the immigration bill by President Cleveland will in one respect be of great value to the American miners of the Northwest. A majority of those engaged in mining in British Columbia are American citizens. Most of the rich mines are owned by people from Spokane and other parts of Washington and from Idaho and Montana, and, from the liberal laws of the province, one not a subject may take up claims and foreign corporations are given all privileges. When the immigration bill, including certain restrictions as to Canadian laborers coming into the Eastern States, was passed by Congress, there was considerable talk of retaliation in British Columbia. While the papers published in that province showed a very liberal spirit, there was yet danger that some measures would have been passed that would tend to do away with the extremely good relations now existing between the miners of the Northwestern States and British Columbia. Large numbers of Canadians have come into those States to engage in business, and the recent development of the mineral resources of British Columbia has drawn even greater numbers of Americans across the border, and they have been received in the broadest and most liberal spirit.

It is to be hoped that any future attempts at legislation against foreign immigration will not be directed against a people with whom we have so much in common as the Canadians.

Geology of the Sierras.

The U. S. Geological Survey has done more work of real value in California during the past year than ever before. The importance of the work from an economic standpoint and the value of the field in the eyes of the scientist for geological investigation have been the incentives to Director Walcott. References have been made in these columns to the folios issued by the Survey, covering different areas, geologically and topographically, and especially to the late publication, the "Nevada City Special Folio."

Now there has been published "Further Contributions to the Geology of the Sierra Nevadas," by Henry W. Turner, a most comprehensive work, devoted to the central Sierra Nevada region.

It forms a part of the forthcoming seventeenth annual report of the U. S. Geological Survey, and embraces about 500 pages. The paper is illustrated with a large number of photographic reproductions which are of much general interest, and in addition many plates representing peculiar and interesting rocks. The latter are, however, of interest chiefly to the technical geologist.

The report contains, as was to be expected, much valuable matter for the special student, but there is also a large amount of information which is of value to the miner and general reader who takes any interest whatever in the history of California's great scenic mountains.

The most important work of the Survey upon the gold belt is now nearly completed, but it seems evident, from the fact that the whole area of these mountains is marked off for topographic sheets, that the geological mapping is to be extended southerly into the higher Sierras and eastward toward Nevada, which will involve many years of work.

In the present paper Mr. Turner discusses the general history of the Sierra Nevadas, the possibility of the presence of Archæan rocks, and in considerable detail the character and classification of the igneous rocks. The main portion of the paper is, however, given up to a discussion of the different atlas sheets, including the Chico, Bidwell Bar, Downieville, Sierraville, Jackson, Sonora, Oakdale, Merced–Mariposa, Big Trees and, more briefly, the Dardanelles, Yosemite and Mt. Dana areas, which are not yet mapped.

For those areas which lie in the main gold belt Mr. Turner discusses the geological features under two heads.

(1) The superjacent series, including the alluvial, glacial and lake deposits and other beds of Tertiary age, many of which are valuable because of the presence of gold. The volcanic rocks are an important feature of the superjacent series from an economic standpoint, as they cap in many instances the old river channels.

(2) Under the head of subjacent series is treated the auriferous slate series proper and the various kinds of pre-Cretaceous igneous rocks which form the main body of the Sierra Nevadas. In this connection the geology of the mineral deposits is discussed.

Owing to the fact that the United States Geological Survey has done so much in the Sierras, and expects to do more, and that the maps and reports are in part sent free upon application, it would seem that it would be very advantageous for miners and others who are interested to become fairly familiar with the more important geological terms and theories which are so clearly given in this as well as in other reports. The region concerned is destined to grow more important from an economic standpoint as the years pass, and the ability on the part of those interested in mining to appreciate the larger geological questions will be of much practical value as well as give personal satisfaction.

Although several distinct parties have been carrying on geological mapping in the Sierras, their conclusions are generally in harmony, and must result in a vast amount of practical benefit. In the present paper there is nothing particularly new advanced, unless it is the theory that many of the gneisses and schists are of Archæan age. Up to within recently there has been some question as to whether these most ancient of rocks occur in California, but it is becoming more probable that they exist not only in the Sierra Nevadas, but in parts of the Coast ranges, as well as in the southern part of the State.

Concentrates.

A LEDGE of copper ore has been discovered near Randsburg, Kern county, Cal.

ESTIMATES of the copper output of Arizona for 1896 place it at 63,333,788 pounds.

SOUTHERN PACIFIC surveyors are at work between Mojave and Randsburg, Cal.

A TELEGRAPH LINE from Kramer to Randsburg, Cal., was put in operation last week.

THE discovery of a deposit of tin ore is reported near Granite, Grant county, Oregon.

THE Colorado militia bill for services at the Leadville strike aggregates $200,000.

AT Randsburg, California, the Excelsior claim has been sold to Brown and Shinn of Colorado for $15,000.

THE owners of the Undine mine at Tintic, Utah, have been offered $6000 a month for the water from the mine.

SIX new quartz mills will be erected near Grants Pass, in southern Oregon, as soon as the rainy season is over.

A DISCOVERY of a body of copper ore is reported from Glendale, southern Oregon, which carries copper and gold.

THE Wedge Mining Company, whose properties are in the Randsburg district, Cal., has been incorporated in Denver, Colo.

REPORTS of discoveries of high-grade ore seventy-five miles north of Yuma, Arizona, has caused considerable excitement there.

IN the vicinity of Gold Creek, Elko county, Nevada, some 200 quartz claims and 10,000 acres of placer ground have been located.

AN appropriation of $5000 a year for five years by the Washington Legislature for a geological survey of that State is being advocated.

THE Butte mine at Randsburg, Cal., has been sold to a San Francisco syndicate for $120,000, a first payment of $20,000 having been made.

A LARGE deposit of what is said to be a good quality of marble has been discovered on the desert about twelve miles from Victor, San Bernardino county, Cal.

IN anticipation of the opening of the Uncompahgre reservation in Utah a number of people who want to take up gilsonite or asphaltum beds are already on the scene.

THERE is in contemplation a consolidation of the Mollie Gibson, A. J., Deep Shaft and Franklin mines, which would make one of the greatest mining enterprises in Colorado.

THE Le Roi Mining Company, at Rossland, last week started up its new 40-drill compressor. The engine, of 450 H. P., will work the pumps and hoists, as well as the compressor.

A BILL is before the Utah Legislature providing that notices of location shall be filed with the county recorder instead of the recorder of mining districts, as has been the custom.

THE owners of the Payne mine, in the Slocan, British Columbia, will put in a tramway this season 7000 feet in length, over which 100 tons of ore daily will be shipped by gravity.

THE California Exploration Company is sinking shafts or running tunnels on six mines in Calaveras county, Cal., the Bund, Burgess, Gottschalk, Golden Hill, Vire and Maloney.

SOME Butte, Montana, mining men have obtained options on a tract of coal lands in the Clark's Fork county, near Red Lodge, with the idea of supplying the product to smelters in Butte.

CAPTAIN J. B. DE LAMAR, in January, secured an option on a majority of the stock of the Mercur mine in Utah at the rate of $3,750,000 for the whole property, but has given it up after examination.

SEVERAL large placer claims are being fitted up by capitalists in the John Day country in Oregon. Ditches built as long ago as 1862 are being reopened and considerable machinery has been sent in.

IN the California State Senate last Tuesday, on motion of E. C. Voorheis, the Assembly joint resolution advocating the passage of the California mineral land bill by Congress was passed by a vote of 32 to 0.

SAN FRANCISCO capitalists, represented by J. J. Fowler, have bonded the Red Mountain copper mine, near Ukiah, Cal., for $10,000. The mine was discovered and worked a little some twenty-five years ago.

IT is contemplated by Salt Lake and Ogden people to erect an electric power plant on the Bruneau river and transmit 2500-horse power to the Oro Grande mines, lying between the Bruneau and Owyhee rivers.

THERE are said to be twenty-five paying mining properties in the Silver Star district, Esmeralda county, Nevada. That county, with a production of $360,000 in gold in 1896, was second in the list, Lincoln being first.

LAST WEEK a sale of ten shares of Calumet and Hecla stock was sold in Boston at $370 a share—the highest price on record. This is at the rate of $37,000,000 for the whole of the stock of this great copper property.

THROUGH the efforts of the Chamber of Commerce of Aspen, Colorado, such reductions in freight rates and royalties have been made on the silver ores of the district that the output promises to be larger than that of 1896.

B. R. SWEETLAND, Tucson, Arizona, sends an argument that iron is the base of charcoal, and that carbon is not an element, and suggests that the word "ferri" be substituted for "carbon" in chemical nomenclature.

THE owners of the Kennedy mine at Jackson, Amador county, Cal., are making arrangements to put up more powerful hoisting works over the north shaft, capable of sinking 1000 feet deeper than the present deepest level.

THE Gold Creek, Nevada, *News*, describing the mica mines in the Ruby mountains in Elko county, says that they crop out here and there through the crest of the mountain for a distance of sixty miles, and is of the best quality.

NO LESS than 170 miners perished in the Zanamoro mine at Zacatecas, Mexico, last week. A fire broke out and the men were suffocated. The principal shaft is 3300 feet deep, and proper precautions had not been taken for means of escape in such cases.

A CABLE from Yokohama announces that the Japanese Government has decided to adopt the gold standard, at a ratio of 32½ to 1. The smallest gold piece will be of the value of five yen. The silver yen will gradually be withdrawn. The new law comes into operation in October.

W. S. WOOD, of the Gulf Railway Mining Company bureau, has gone to Hartville, Wyoming, to make an examination of the iron ore alleged to be in existence there, to develop which it has been proposed to build a branch railroad connecting with the Gulf system at Orrin Junction.

AT the De Lamar mine in Idaho the wages of miners were reduced from $3.50 to $3 per day February 1st. The mine is not paying as well as formerly and the management announces that the utmost economy will have to be exercised in order to keep the property in operation.

MISS SCOTT of Boise City, Idaho, is the owner and manager of the General Pettit mine, near the old Atlanta, and in which there is said to be $750,000 worth of ore blocked out. She has lately been investigating different methods of working the ores, with a view to putting up a large plant.

THE Elkton Consolidated mine of Cripple Creek, Colorado, is a good example of what can be done in the way of making profits in a big mine. Since March, 1896, the value of ore mined has been $539,000, and of the proceeds $355,000 has been clear profits. There is in sight ore valued at $600,000.

THE output of the Arizona Copper Company, at Clifton, for December last was 437,424 pounds of copper and 624,798 pounds of matte. The total output of this company for the year 1896 was 7,572,376 pounds of copper and 7,679,462 pounds of matte, a monthly average of 531,041 pounds of copper and 630,071 pounds of matte.

ENGLISH lead mines in Northumberland and Cumberland, which have been worked in an old-fashioned way for centuries, have been taken hold of by a Belgian company, who have put in a large number of extra hands and are spending considerable money in development and metallurgical machinery.

THE Quincy, Mich., Mining Company are credited with intention to erect a smelting plant of their own to cost $75,000, to be ready for operation when the present contract with the L. S. Smelting Company expires in 1898. The new plant is to be located near the stamp mill on Portage lake, to which they will also build an addition.

IT is announced by the Jacksonville, Oregon, *Times* that a syndicate formed by Eastern capitalists has been making arrangements to build a large irrigating and mining ditch to take water from the Rogue river near the forks and carry it along the foothills to Gold Hill and the Kane creek country. The proposed capacity is 10,000 inches.

THE report of the State Comptroller of Nevada shows that there were 90,799 tons and 1397 pounds of ore worked in the State for the year 1896, giving a gross yield of $3,857,841.38. Of this amount Lincoln county turned in 41,183 tons and 1836 pounds of ore, giving a gross yield of $1,528,283.63. The balance of the counties turned in 49,616 tons, giving a gross yield of $2,329,557.75.

DIRECTOR PRESTON of the United States Mint has issued a statement showing that there is on hand at the several United States mints, purchased under the act of July 14, 1890, 119,827,991 fine ounces of silver bullion, which cost $108,208,996, and the coinage value of which is $154,929,120. Five and three-quarter million ounces are at San Francisco, three millions at New Orleans, half a million at Carson City and the balance at Philadelphia.

THE fact that 1000 tons of delayed freight await shipment to different mines from Oakdale, Stanislaus Co., Cal., illustrates the need of road improvements. At present throughout a large area of California the roads are impassable for a vehicle of any kind. The attendant loss in one season, represented in dollars, would go far toward putting those foothill roads in better shape. Lack of proper road facilities is one of the most serious drawbacks to the prosperity of California's mining industry.

THE New York correspondent of the London *Mining Journal* states that any London firm desiring a copy of the report of the California State Mineralogist will be able to procure one by simply writing to J. J. Crawford, State Mineralogist, San Francisco. This impression prevails in other parts of the country. Any one in California may obtain a copy by personally applying at the Bureau, or by writing and forwarding 17 cents for postage. But those outside of California must forward $1 in order to obtain it.

THE digging of big tunnels in Colorado to tap the big mining districts has become an important industry and is doing much toward developing new mines or improving old ones. But there is arising considerable trouble as to the ownership of blind leads cut. The tunnel people claim the right to all blind leads along the line of their bore that were not discovered prior to starting their tunnel. This is hardly fair, and trouble is arising with owners of mines who have discovered and worked such leads that have been found after the tunnels have been started, but before they had cut them.

THERE is considerable discussion in Los Angeles, Cal., over propositions to regulate the production of oil so as to abate certain nuisances connected with it. One paper demands that the boring of oil wells should be prohibited within 1600 feet of a residence without the written consent of the owner. As there is no point within the limits of Los Angeles that is more than 1600 feet from a residence, this would amount to prohibition. The chief nuisance complained of is the running of overflows into the gutters. This, it is claimed, could be abated by forcing the owners of the wells to use more care.

EARLY in January a press dispatch announced the sale of the Caledonia mine at Cripple Creek, Colorado, in London for $585,000. It had been bonded by W. S. Stratton to the Six Brothers Company for $50,000. Some one in Colorado Springs wrote to a London paper showing that it was a case of overcapitalization with a vengeance. The result has been that English promoters have drawn in their horns and are putting it on their market at something nearer the real value. It might be a good idea for the English investors to look after their promoters a little more closely and quit putting the blame for their rascally swindles on the mine owners of this country, Australia and British Columbia.

THERE have been filed for record at Bakersfield, Cal., agreements of F. L. Mooers giving to Patrick Reddy of San Francisco option to purchase a one-fourth interest in the Olympus, Trilby, Rand, Singleton, Desert View and Johannesburg mines, Rand district, for $45,000, and one-fourth interest in the Triangle, Wedge, Yellow Aster and Mariposa mines for $5000, and agreements of E. Rose, John Singleton and C. A. Burcham giving Reddy an option on one-half interest in the Trilby, Olympus, Triangle, Wedge, Yellow Aster, Rand, Mariposa, Desert View, Johannesburg and Singleton mines, in the Rand district, at $100,000. Burcham, Mooers and Singleton were the first discoverers of the quartz mines in the Rand district. Shortly after the discovery a bond was given for their sale to Douglas Browne, a Colorado mining engineer, and his associates, and out of this grew a lawsuit, in which Reddy obtained as a fee a quarter interest in the properties. He won the suit and now it is proposed to interest capital to develop the mines.

RESIDENTS of Deadwood, South Dakota, have sent a telegram to the President protesting against the forest reservation lately made in the Black Hills, and saying that he has been deceived by persons without knowledge of the conditions or reckless of the consequences. This reserve, if maintained, they say, will affect disastrously all the mining and dependent industries of the region and largely compel its depopulation. Last Saturday Congress rescinded the presidential order so far as all the States, except California, were concerned. The entire area reserved was 21,379,840 acres. The two in California are the Stanislaus reserve, embracing 691,200 acres, and the San Jacinto reserve, an estimated area of 737,280 acres.

IN Victoria, Australia, a powerful local syndicate in the Bendigo gold fields has been buying up as many of the tailings heaps as they can secure. Among others they have purchased the tailings at St. Mungo, New Moon, Johnson's Reef, Beehive Crushing Works, and the pyrites works at Jackass Flat, all at Bendigo, amounting in all to over 2,000,000 tons. These will take fully five years to treat, and will prove of great advantage to the field by the adding of a good asset to mining companies, and the providing of employment. The same syndicate is also endeavoring to obtain a lease of the bed of the creeks in the district, and it is estimated that if they are successful in getting the right to wash them they will have fully 3,000,000 more tons to operate upon.

A TELEGRAM from Washington announces that W. J. Puckett, assayer in charge of the Denver mint, has made a report to the director of the mint at Washington on the value of the mine production of Colorado for 1896. His figures are: Gold, $15,110,960; silver (coinage value), $27,859,042; lead, $2,784,065; copper, $811,782; total, $46,565,849. Mr. Puckett's estimate of the gold production for 1895 was $15,013,434, and the director's report for that year makes the production $13,305,100. The silver production for 1896, it is stated, has fallen off about $3,217,000. Two disasters, Mr. Puckett says, materially reduced the mineral production of the State during the year—the Cripple Creek fire and the Leadville strike.

THERE is considerable adverse criticism in Washington of President Cleveland's action in withdrawing from sale as forest reservation 8,056,087 acres in that State, or nearly one-fifth its total area. It is claimed that these lands include most of the best mineral land in Okanogan county, and, while the act does not prohibit miners and prospectors from entering and searching for mineral, it does, it is claimed, prevent the development of the properties, as the timber cannot be used. It would appear that there should be little trouble in getting a further proclamation from the President or an act passed by Congress giving the right to use timber, under proper restrictions. If so, it will be much better for the mining industry after a few years that reasonable restrictions are put on now.

A BILL has been introduced in the Legislature of New Mexico providing that all mining claims shall be thrown open to relocation after a period of ninety days, provided that the first locator has not done the required assessment work—a 10-foot hole or its equivalent in an adit or other work. The bill affects only that class of persons who have by their non-compliance with the law in not doing any work whatever, forfeited their claims, but are still holding public domain by a series of relocations to the exclusion of bona fide locators and prospectors, thus retarding the mineral development of the mineral resources of the Territory. Under the bill a man may locate as many claims as he pleases, but will forfeit any upon which he does not do the required work within ninety days.

A BILL introduced in the British Columbia Legislature as a government measure as to corporations provides that no company hereafter shall commence business unless 10 per cent of its capital stock shall be paid up in cash. Another important clause is to the effect that nothing done by a foreign company, although valid in the country where it was formed, or permissible under its original corporate powers, shall be of any force unless it be within the rights, powers and privileges and according to manner exercisable by companies under the proposed act. Another provision is that every foreign company shall have a registered office in British Columbia. Al companies will be compelled to prepare a balance sheet once a year showing receipts and expenditures. The new rate for charges for registering companies will be one-tenth of 1 per cent on capitalization.

IN Cuba, while gold and silver have not been found in paying quantities, copper was mined at Cabre by the natives before Columbus discovered the island. Early in this century English capitalists purchased mines near Santiago, and the books of the Consulate show that from 1828 to 1840 an average of from two to three million dollars' worth of copper was shipped annually to the United States from these mines They continued in successful operation until 1867, when a combination of circumstances, and not the poverty of the mines, closed them up, and the various shafts, from 900 to 1200 feet deep, filled with water, all save 300 feet being below the level of the sea. In later years, considerable copper was taken from these mines by pumping the water from shafts to tanks into which iron scraps were thrown.

ON the first of this month the De Lamar mine in Lincoln county, the most productive mine in the State of Nevada was closed down. In connection with this Captain De Lamar, the principal owner says: "The recent organization of a miners' union under the direction of Edwin Boyce, president of the Western Federation of Miners, and movements on the part of a certain element which appears to have arrayed itself against the company's interests, all indicate that the brewing of a strike has begun, and induced us to take this step. The property will be closed down for an indefinite period. We desire to give those who have inaugurated the movement and those whose co-operation they are soliciting plenty of time for reflection. The lesson which has been recently taught through the trouble at Leadville should serve as a warning to those who are agitating the movement at De Lamar, and I make the prediction now that every man who participates in it will live to lament his action. At Leadville the place of the union miner has been taken by the miner from Missouri, homes have been broken up, men to whom they were dear have been compelled to seek employment in strange diggings—some perhaps, in Missouri, where the wages are $1.25 a day as against $2.25 in Leadville. At the De Lamar we are paying $3, and those who receive it are prosperous."

Turquoise Mining in New Mexico.*

Written for the MINING AND SCIENTIFIC PRESS by W. C. FENDERSON, Santa Fe, N. M.

The early mining of turquoise in New Mexico is enveloped in a haze of myth, tradition and superstition difficult to penetrate. The searcher for authentic history concerning this fascinating subject is confronted on the very threshold of his endeavors with fact and fiction so skillfully interwoven by the hand of Time and so generously amplified by myths long antedating the discovery of America that he is apt to view the segregation as a well-nigh hopeless task.

One of the oldest gems known to history, it would seem that the turquoise wherever found has always formed the basis of the most fantastic superstitions. This is easily accounted for. The stone is extremely sensitive, and under slightly varying temperature as well as by contact with certain solids and fluids changes color. Thus it has come to be consulted as an omen, and endowed with magic and talismanic properties—virtues which it has retained to a great extent up to the present day. Of course, many of the grosser superstitions connected with turquoise have disappeared and are now to be found only in time-stained volumes of the fifteenth, sixteenth and seventeenth centuries. Others have survived time and the spread of intelligence and are as potent to-day as in the past.

Persian soldiers prize this stone as a protection against contagion, as do the Indians of New Mexico, and Russian officers carry it for its supposed efficacy against the fatal effect of wounds received in battle. The monarchs of the East wear turquoise amulets, and also use it in decorating horse trappings, swords, etc., and everywhere throughout Eastern countries it is believed to protect the wearer against disease and insure him a speedy triumph over his enemies in war. In affairs of the heart, too, it was and is held as a charm of great potency, and in this regard the Indians of New Mexico hold an opinion exactly similar to that entertained by their more enlightened brothers of the East.

The stone they say is composed of elements having the closest affinity with the wearer. As long as love lies in the heart of the person receiving the gift, so long the stone retains its brilliant color. But with the decline of affection the animal life of the stone experiences a corresponding decline and finally dies with the love of the wearer. Hence the change of color. This is held as a safeguard against any possible deception on the part of the lady. When the stone begins to lose its azure blue and take on a green tint the fond lover need not ask his queen if her love is growing cold. He simply consults the gift stone, which is a true register of her feelings.

On the same principle the turquoise, according to the belief of many, changes color with the decline of the wearer's health. About the middle of the sixteenth century a Spanish lapidary named DeVargas wrote a learned treatise on precious stones, from which I extract the following: "One of my relations had a turquoise which he had set in a ring of gold and wore on his finger as a superior ornament. It chanced that he was seized with a malady and gave up his life. During the whole time in which he enjoyed his full health the stone was distinguished for its beauty and clearness, but no sooner was he taken ill than it commenced to fade and upon his death it assumed a withered, lifeless green color as though mourning for its master." * * *

Coming down to our own times, certain facts are known to observers and experts concerning this stone upon which were no doubt constructed the myths and superstitions of credulity. Lapidaries are well aware that the brilliancy of turquoise depends to a great extent upon the weather, also that certain persons cannot wear the stone without causing it to deteriorate, in many cases never to be restored to its original brilliancy. Only a short time since a New York physician told me that he had seen a valuable turquoise ring entirely ruined on the finger of a man who had been stricken with a severe attack of typhoid fever.

Turquoise is found in Persia, Saxony and New Mexico. The Saxony product is of an inferior grade, is found in red sandstone and is so sensitive that most of it is ruined on the lapidary's wheel. Practically all of the turquoise of the world has been taken from the mines of Persia and New Mexico. The Persians call it *firusa*, and this is probably the *callais* of Pliny. The Persian stone has a chemical composition represented by the formula $2al_2O_2P_2O_5H_2O$, and the Shah has for years controlled the output of his country, allowing only gems of an inferior quality to leave his collection, supposed to be the most valuable in the world. According to report these mines are about exhausted, and it may be due to this fact that the industry in New Mexico is receiving so much attention of late. But from whatever cause, the fact remains that the production of turquoise bids fair to become one of the leading industries of the Territory. The Mexican name for this stone is *Chalchuitl*, and how long the mines of New Mexico were operated prior to the Spanish conquest is a mere matter of speculation. That the work was extensively carried on in a dozen different locations is attested by the implements unearthed in recent years which were used by the Indians before the advantage of steel or iron tools was known to them. Near Cerillos, in the southern part of Santa Fe county, there is a section of mountainous country over two hundred acres in extent, every foot of which has been worked over in search of turquoise. Here it was that the big *Chalchuitl* mine caved upon its workmen and buried alive half a hundred natives who were worked in slavery by Spanish masters. It was this incident that caused the revolution of 1681, when the Spanish were driven out of the Territory and forced to remain away for a period of sixteen years. Striving to obliterate all memory of their hateful slavery, the natives filled up every mine in the Territory, destroyed churches and even whole towns in their endeavors to wipe out the work of their oppressors. This was the largest turquoise mine in New Mexico in the old days, and so it is at the present time.

*See engravings on front page.

The Indian method was crude in the extreme. Their only implement was a stone hammer, and they never got deep enough to find the best stones. The white man of to-day follows the lead of his Indian predecessor in these old mines, but goes about 10 feet deeper, there finding his purest gems. The Indians had a curious method of blasting turquoise rock. Over the refractory mass they would build a hot fire and then dash upon it water, causing the rock to crack. Then the stone hammers came into play and the ore was crushed into beads, which after being drilled were strung and worn as ornaments or charms.

Out of some sixty or seventy turquoise claims in New Mexico, about a dozen mines are in operation. The total output of turquoise in the Territory was $150,000 in 1891, $175,000 in 1892, $200,000 in 1893, $250,000 in 1894, $350,000 in 1895 and $475,000 in 1896.

These figures are taken from official sources, but no doubt greatly underestimate the true value of turquoise mined since 1890. Why this is so will appear from the following incident: Last year the owners of the largest turquoise mine in the Territory put in a valuation of their property amounting to $250. The County Commissioners, knowing that the mine had been in constant operation, considered the valuation absurdly low and set about an investigation which resulted in raising the valuation from $250 to $25,000, upon which the owners cheerfully paid the levy. This same mine sold in 1893 for $250,000, and, according to the statement of a former owner, has paid a million and a half a year since that time. In 1895 one stone was taken out that sold for $6000. This stone is now owned by a New York jewelry house that also controls four of the best mines in the Territory.

Recent discoveries have been made, demonstrating the existence of valuable turquoise deposits, notably in the Burro mountains near Silver City, about the Hachitas, and in the Jarillas as far south as Las Cruces. As before stated, the oldest and best known mines are located in the southern part of Santa Fe county, near the town of Cerillos. Most of the claims being worked in this section are the old filled-up mines of slavery days, though several have been opened of late on virgin ground. The greatest secrecy is maintained, both as to the location of mines and the method of working them. No one is allowed to inspect a turquoise mine, and employes are warned against giving any information concerning operation upon pain of immediate discharge. Some time since Gov. Thornton, who is very fond of turquoise, asked permission to inspect one of the mines at Cerillos. He was refused. The formation in which turquoise is found varies greatly. In the vicinity of Santa Fe the matrix is usually a white trachyte stone filled with bright crystals of pyrites, which upon decomposition from exposure turns a rusty brown. In some cases the matrix is red sandstone. In the Burro mountains the formation is rose quartz, slender needles of which penetrate the turquoise deposit, spoiling it for gem purposes. In the Hachitas the matrix is a red granite. It is difficult to account for these vagaries in formation, existing in the case of no other mineral known to science. The turquoise solution in the form of a liquid was undoubtedly at some period infiltrated into the seams of the rock, where it gradually solidified. This is proven by the fact that wherever the veins are wide enough the turquoise is found in uniform pebbles with a talcose surrounding.

The color of the gem varies as much as the formation, azure blue being the color most sought and most likely to hold its color. The dark blue stones are preferred in England, pale blue in the United States commands the best price, while in Paris pale pea green or apple green stones are the most sought.

In Russian Persia and the East Indies there is not much choice in the matter of color. The prices of these gems—that is, clear stones without a flaw—are nearly uniform the world over. For small stones, from 50 cents to $2 each. Good ring stones find ready sale from $25 to $200 each. Large stones of good quality and color realize exorbitant prices. A perfect stone about the size of a silver quarter would bring $3000, either in European or American markets.

Chemically, the American turquoise has about the same properties as the Persian product, the former being composed of: Alumina, 47.75; phosphoric acid, 27.34; water, 18.18; protoxide of copper, 2.02; peroxide of iron, 1.10; peroxide of manganese, 0.50; calcium phosphate, 3.41.

The great profit in turquoise mining is found in the simple and inexpensive methods of handling the ore. No costly machinery, no intricate and expensive treatment of the product of these mines are required. From surface indications a shaft is sunk, until turquoise rock shows up in paying quantities. Then drifting commences—that is, tunnels are run to follow the vein. The rock is blasted and then broken into portable shape by sledge hammers, then put into a bucket and hoisted to the surface by means of a windlass. Here it is sorted, then packed into boxes and shipped to firms that have contracts with the mine owners for cutting. Most of the New Mexican turquoise goes to New York, very little being cut in the Territory. The average Mexican turquoise miner gets $1.50 a day; Americans get $2.50. The larger mines work only seven to ten men each, and in good rock this force can take out from eight to ten thousand dollars daily. This was the record of one of the mines near Los Cerillos for a month and a half last year, then the pay streak petered out and there was three months of dead work. There is undoubtedly a great future for turquoise mining in New Mexico, but those now engaged in this industry knowing that they have a good thing, try to create the impression that the mines now in operation are being conducted at a loss. This causes them to maintain the strictest secrecy in everything relating to the business. They will not allow photographs to be made, or consent to allow any one to inspect the mines; neither will they give any information concerning the subject in general. There are not half a dozen people in New Mexico who have ever seen turquoise mined, outside of those engaged in the work.

Copper Refining.

In his address before the chemical section of the British Association, Ludwig Mond, speaking of copper refining, said:

The first patents bearing on the electrolytic refining of copper were taken out by James Elkington of Birmingham in the years 1865 and 1869; and some time between these two dates the first electrolytic copper refinery was established at Pembrey, near Swansea. It is interesting to note that this works, though it has now passed into other hands, is still producing electrolytic copper; and though England to-day no longer stands in the forefront of the electrolytic copper industry, it is because the conditions of the industry have changed, and not because she has lacked either the money or the brains requisite to continue an industry which she originated. The famous Mansfeld Copper Company of Germany were the next to use the process; and in 1872 a small refinery was started at Eisleben, near the Hartz mountains. The "Norddeutsche Affinerie," at Hamburg, followed in 1876; and, two years later, the Oker Refinery of the "Communion Huttenwerke" was commenced. A large number of small refineries in France and Germany now sprung into existence; and for many years these European refineries, including three or four in England, had the production of electrolytic copper in their own hands. The "Norddeutsche" refinery at Hamburg, with two plants, was the largest and best arranged of all these; and of the others, that at Pembrey alone approached it in output. Yet the combined annual output of these two works in the early days of the industry was only 1000 tons. A rapid development, however, in the scale of operations occurred between 1880 and 1890. The spread of electric lighting, and the demand to which it led for a pure copper, caused new refineries to spring up and the older ones to increase their output enormously. In Europe the "Norddeutsche," Messrs. Vivian's and Messrs. Bolton's, with the original refinery at Pembrey, ranked first in size; but the development of the industry in the United States quite overshadowed these European extensions.

The mine owners in America who had been rapidly increasing the output of raw copper from the mines were struck by the very obvious fact that they were paying European refiners to do what they could equally well do themselves. With the energy and love of bigness characteristic of our friends across the Atlantic, they set to work and planned refineries on a scale that has reduced some of the early European ones to mere toy dimensions. Some of these refineries have been doubling and trebling their output of electrolytic copper in the years 1892–1895, so that to-day not only the output of raw copper, but also the amount refined, is greater in the States than in any other part of the world.

At the end of the year 1895 one-third of all the raw copper produced in the States was being refined there, and it was expected that this year the pro-

portion will have risen to half. Adding the amount refined electrolytically in Europe, it is safe to estimate that at least 100,000 tons of raw copper are now being treated by the electrolytic refining method. We thus arrive at the remarkable fact that an industry started on a small scale by Mr. James Elkington at Pembrey about 1868, and one which, until about 1885, did not show any remarkable signs of development, has become nearly as important as the copper industry itself, and has extended until it embraces over a quarter of the entire copper output of the world.

This rapid extension has been chiefly due to the demand for a pure copper for electric construction purposes; but the recovery of the whole of the silver and gold contained in the raw copper, at a comparatively small cost, has been a very slow process.

Outline of the Geology of California with Reference to Its Mineral Deposits.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS Ph. D

Gold deposits occur in all the pre-Cretaceous rocks of California. Their character differs, however, somewhat with the kind of rock and the ease and regularity with which it fissures. The reasons for the mineralogical differences are not well understood. The veins in the granite in eastern California have generally a rather base character below the water line, while in the main gold belt on the western slope, where there is little granite, a large part of the gold occurs in the free state. It is all nonsense to assert that gold is found with any particular class of wall rocks. The importance of the mineralogical character of wall rocks has been greatly overestimated. In my experience over nearly the whole of California I cannot recall any rocks with which gold is not at times associated, unless it is some of the modern volcanic rocks, and while along the mother lode it may be more often found with slate and greenstone, yet in other parts it occurs in the most diverse kinds of rocks. We may say, then, that in the distinctly mineral regions of California the deposition of gold at least is but slightly influenced by the character of the inclosing rock. The fact ought to be emphasized that no rules can be laid down for the guidance of prospectors in regard to the kind of wall rock they ought to look for. In a region of dikes the gold is not due primarily to the presence of the dikes, nor to the good fissures which may be formed along their contacts—fissures, of course, formed more easily and regularly than in the non-laminated rocks—but rather to subterranean heat, movements fracturing the rocks, and mineral-bearing waters. Dikes are indications of mineral veins only in so far as they offer lines of weakness and fracture for the passage of solutions in a mineralized region.

We ought not to conceive of the gold-bearing veins as in general having been formed in large open fissures, for there is not much evidence of it in this State at least. Hot mineral-bearing waters remove gradually portions of the walls of fissures, acting most easily upon the partly ground-up material, and then upon the solid rock itself. It is known that the veins of the gold belt were formed at a very great depth, and it is inconceivable that openings the size of the great ore bodies which have been found should have existed during the long period requisite for their filling. The banded or ribbon quartz of the mother lode region is due, it seems to me, to repeated loosening of the walls of the fissures as a result of mountain disturbances, so that thin layers of quartz are separated by films of chloritic matter derived from the rubbing of the wall upon the quartz when the fissures were tightened.

As has been said before, the gold veins were formed ages ago (close of the Jurassic), and since then the surface of the country has been profoundly modified. As a result, the topography to-day gives almost no idea of what it was when the veins were formed, so that paying veins are just as apt to be found in a stretch of rolling country as one highly mountainous. If a prospector is satisfied by the general indications that he is in a mineral region, he may, until he learns its characteristics, as well prospect in one portion as another, guiding himself by placer deposits, float rock and the reddened character of the outcrops. As far as the present topography is concerned, one is as liable to find permanent paying veins in the granite knobs and gently rolling hills of some portions of the Mojave desert, as in the very high mountains farther north in Inyo county. The events which gave rise to the mineralization of this region are separated by ages from those which originated the recent topography. The most of the mineral deposits of eastern California bear no relation to dikes. The gold and silver both occur in association with a great variety of rocks and very frequently in the massive granite. Why it is that the great granite areas of the Coast ranges are free from minerals it is difficult to say, unless it is that the conditions which gave rise to the mineral springs of the gold period were absent from this region. The deposits which are occasionally met are probably of the same age as those in the Sierras and Klamath mountains.

During the deposition of the gold and silver, and for many hundreds of thousands of years afterward, the mountains of California were undergoing erosion and their material being carried off in the streams. We have no adequate means of discovering how many thousands of feet in thickness of rock has been disintegrated and removed.

Silver seems to be chiefly confined to the region of the great basin east of the crest of the Sierra Nevadas, where it either occurs by itself, generally in limestone, or with gold in other formations. The occurrence of the precious metals seems to be somewhat different geologically in that region from what it is in the rest of the State. The gold is characterized by the fact that it occurs almost wholly in iron or copper pyrites below the water line. Why silver is abundant in that region and not farther west we do not know. It may be dependent partly on the different conditions of deposition, for it is mainly found in limestone, which is abundant there, and partly upon the original difference of the chemical action in the deep seated regions from whence the mineral bearing solutions derived their contents. The evidence is good that the silver deposits when they occur in chamber form in limestone are due to replacement, but whether they occur at as great depths as gold we have not yet sufficient evidence to say. At Modoc, in Inyo county, the best ore is reported at a depth of over 1000 feet.

The Sierra Nevada region has never been covered by the sea since the great upheaval previous to the period of mineralization, but the Coast ranges have been almost submerged many times. The mineral deposition ceased before they first began to sink for the next younger rocks, the Cretaceous, contain none worth mentioning. These younger rocks are generally so different that it is not often the prospector can make a mistake, although he may in some portions of the Coast ranges.

Through the long geological ages represented by the Cretaceous, Eocene, Miocene, and a part of the Pliocene, the Sierra Nevadas were undergoing erosion and being reduced from a lofty range to one with gentle slopes and broad river valleys. Oscillations of level took place, but they were not so pronounced as in the Coast ranges, where the land rose and sank many times in response to an equilibrating movement of the crust. In these ranges these disturbances are used to mark off different divisions of geological time. The northern end of the Sierras, now occupied by Lassen's Peak (volcanic ridge), was below water. An arm of the sea extended up the Sacramento valley and into Oregon, making an island of the Klamath mountains. During a part of the period of depression, known as the Upper Cretaceous, the streams flowing from the Klamath mountains brought down to this old seashore considerable quantities of gold, and the waves and currents distributed it along the ancient beach, together with gravel and boulders, to form the conglomerates now exposed in this region. They appear in Shasta and Siskiyou counties and in southern Oregon. These auriferous deposits have been erroneously considered as an ancient river channel, but they contain ocean shells and must have been formed along the shore.

In the northern Sierras, during the Eocene and Miocene, the climate was warm and moist, as shown by the vegetable remains in the old lakes and river beds.

During hundreds of thousands and perhaps millions of years the rivers of the Sierra Nevada region were concentrating the gold from the disintegrated quartz veins as the wear of the rocks exposed them to view. It is quite certain that in the gravel now deeply buried along the eastern side of the San Joaquin and Sacramento valleys lies untold wealth which can probably never be reached. The ancient streams which finally became almost choked up by means of the sand, gravel and boulders gathered in their beds, we now recognize as the auriferous gravel channels. They flowed much the same direction as do the modern streams, but in broad shallow valleys. The scenery of the Sierras was then tame and uninteresting, and the climate warm. The sea filled the Sacramento and San Joaquin valleys, and the Coast ranges were low and bordered with islands. These ancient river channels are to be observed occasionally in the southern part of the State and on the peninsula of Lower California. In San Diego county is one rich in gold, also in the San Gabriel and San Emedio mountains. The placer deposits about Goler, in the Mojave desert, are partly modified shore deposits and partly the result of stream erosion. The topography of that region is an ancient one, and the amount of gold buried at considerable depths in the desert gravels must be very great.

During the Pliocene disturbances began to be experienced along the crest of the Sierras, and enormous volumes of andesitic lavas were poured out. Some of the flows built up low portions of the crest, while others flowed down the ancient river beds toward the west. Mud and boulders accompanied these flows, capping the old river beds. Following the lava eruptions, a renewed activity in mineral deposition took place east of the Sierras and in portions of Nevada. The silver deposits of Alpine county, the enormously rich gold veins of Bodie and the Comstock lode date from this time.

Some time after the lava flows were inaugurated the Sierra Nevadas began to rise through the formation of faults or fissures on their eastern side, giving rise to the precipitous scarp extending for over 100 miles. As the land arose the streams commenced to cut out their beds and made the beginning of the deep canyons in which they now flow. The sea was finally crowded out of the great valley of California, and the Coast ranges were elevated to approximately their present proportions.

We have so far only slightly touched upon the history of the Coast ranges, which is complex but very interesting. The geological history of no portion of California has been more misunderstood than this region. An old theory of the geologists was that the continent has grown successively westward by the addition of range after range of mountains elevated from beneath the sea, and that as a consequence the last bordering the ocean must be the youngest.

(To be Continued.)

Recent Additions to State Mining Bureau Exhibits.

Trilobites and other silurian fossils from the Chicago drainage canal.

Silver-bismuth ore, Yankee Girl mine, San Juan, Colorado. F. C. Mathyas.

Gold quartz with free gold, Harrison gulch, Shasta county, Cal. H. B. Gaston.

Gold quartz, Fortuna mine, Arizona. C. D. Lane.

Gold quartz, several specimens, Kalgoorlie, West Australia. A. G. Holroyd.

Telluride of gold in calcite, Kalgoorlie, West Australia. A. G. Holroyd.

Gold quartz, Rand mine, Randsburg, Kern county, Cal. W. H. Wilton.

Gold quartz, several specimens, Berner's bay, Alaska. L. G. Bach.

Gold and silver ores, several specimens, from Colville Indian reservation, Washington, and Rossland, Slocan, etc., B. C. L. E. Richardson.

Auriferous vein matter—ochrous earth assaying $7500 per ton, Blue Bell mine, Hayden Hill, Lassen county, Cal. Ed B. Preston.

Gold quartz showing free gold, Cadmus mine, Nevada City, Cal. Chas. Kahl, Supt.

Ten specimens new minerals—bravasite, bieberite, caxoclasite, berzelite, cryophyllite, ralstonite, riebeckite, bayldonite, leuchtenbergite and diaspore. J. Z. Davis.

Gold quartz with copper, etc., Mesquite mountain, near Garlock, Kern county, Cal. F. Adams.

Gold quartz assaying $78 per ton, Syndicate mine, Potter Ridge, Madera county, Cal. Jno. S Wilbur.

Polished specimens of aragonite from Utah. F. C. Mathyas.

Auriferous pyrite, Congress mine, Arizona. W. H. Storms.

Gold quartz, Aravaca district, Arizona. J. Danker.

Gold quartz, Philadelphia mine, El Dorado county, Cal. J. B. Polk.

Polished specimens marble and serpentine—California. A. L. Seager.

And a number of other specimens from various localities.

Feb. 26, 1897. H. S. DURDEN, Curator.

Mines in Sweden.

Some forty years ago numerous finds of iron, copper, nickel and silver ore were made round the lakes Ann, Kall, Jufoern and Anjau, and some of these finds were worked during a short period. At that time the railroad from Drontheim to Ostersund did not yet exist, and the ore had to be carted from the mines to the Norwegian coast, or to the Roros metal works in Norway, a distance of over 150 miles in some cases. The expenses of such a long carting and the impossibility of transporting large quantities of ore, proved mining to be unprofitable and the mines were soon closed up.

The public have taken little or no interest regarding these mines since that time. However, it seems now as if the improved communications, the railway from Drontheim to Ostersund, the steamers that are trading on the lakes in summer time, the projected new Government railroads, and the invention recently made by the Swedish inventor, Dr. G. De Laval, should rouse the interest that was exhibited during earlier days.

Dr. De Laval has constructed a furnace, by means of which, and through the application of strong electric steam, it would be possible to smelt the ore, and to extract the metal with great facility and economy. A company has been floated with a capital of more than a million pounds, with the object of utilizing this invention, and the company has acquired the immense waterfalls near Trollhattan, and is trying to buy several other falls in the neighborhood for the same purpose.—London Mining Journal.

Mining Summary.

CALIFORNIA.

Amador.

Republican: The Murphy claim, in Hunt's gulch, was bonded some time ago by William Doyle, owner of the Doyle mine. Doyle, in turn, has bonded the claim to O L. Golinsky of San Joaquin. Work has already commenced upon the property. It is the intention to sink a shaft and prospect the mine to some depth.

Record: At the South Spring Hill, mine Superintendent J. R. Tregloan is preparing to sink 500 feet deeper, and machinery for that purpose has been purchased. On the east vein in the Median shaft a contract has been let to sink 100 feet. The machinery at this shaft is being overhauled and safety brakes are being put in. A portion of the stamps in the mill are running on ore from the Talisman shaft. A sudden influx of water in the South Spring Hill mine recently has delayed work somewhat in that quarter. However, the big storms caused the same trouble all along the lode.

Dispatch: At the Kennedy they are sinking the south shaft from the 1950-foot level, and will probably go down to the 2200-foot level before stopping. They are working the levels from the 2100-foot level in the north shaft, taking out ore enough to keep the 40-stamp mill running night and day.

The mill has been started up at the Amador Queen No. 2.

Superintendent Ross is getting the upper hand of the water in the Mahoney mine, and operations will be resumed in a few days.

The new and larger hoist at the Amador Queen No. 1 will be ready for use in a short time.

Ledger: At the Alma the ledge has been prospected from the 1000-foot level with a diamond drill and was found to be about 100 feet from the shaft. It prospected from $6 to $36. A station is now being cut and crosscutting commenced. They expect to encounter the ledge in about four weeks.

At the Bellwether in January employes were notified that at the end of the current month they would have to take 100 shares of stock at 25 cents per share. On pay day the stock was issued to them. A few days later all except one shift were laid off, and advertisements appeared offering Bellwether stock for sale at 10 cents per share. Some of the men are threatening to compel the managers of the company to refund the money and take their stock back.

Butte.

Register: Jas. Carlisle will start his mill soon, and it is thought the new road up from Enterprise will be pushed ahead this spring.

It is reported that E. W. Slater will erect a 5-stamp mill on his quartz ledge in the spring.

Calaveras.

At the Gwin work is being prosecuted on the 1200, 1300 and 1400 levels, and the forty stamps are kept busy. It is expected that when the mine has been properly opened up twice that number of stamps will be kept busy.

The Ford mine is almost the first effort at deep mining around San Andreas. The mine was operated for some time by the Ford brothers, but later corporation was effected, a number of the leading citizens of San Andreas and their friends taking a portion of the stock, and they have kept a force of men employed under the Ford brothers. The shaft is now down 400 feet. The company intends to continue the shaft on to the 1000-foot mark. A mill test of about 1000 tons is to be made as soon as a mill can be secured for the purpose in the neighborhood.

El Dorado.

(Special Correspondence).—Work will be resumed this week on the W. W. Stone quartz property south of town, both on the shaft and tunnel, that were abandoned some time ago. The ledge is from 3 to 5 feet and the ore of fair grade.

Preparations are still in progress toward establishing an electric power plant on the American river. New York people are now at the head of the enterprise, and they are making haste slowly.

A 10-stamp mill is in course of construction on the Hoge property, seven miles west of Placerville.

An option has been given on the Tunnel and Shaft mine, one-half mile north of town, to San Francisco people.

Sinking and crosscutting is progressing rapidly on the Steub property, near Diamond Springs. This was formerly known as the Griffith Consolidated, and, though a good producer many years ago, was abandoned at 150 feet depth.

The Lookout mine and 4-stamp mill are producing good results. The ore body is large. The property is twelve miles southwest of Placerville.

At the Blachard mine, four miles south of town, sinking and drifting are being persistently pursued, and the 5-stamp mill is in constant operation.

An English company is examining a large property in this vicinity with a view to purchasing. There is considerable development work done, and the experts are pleased with the results of their assays. The result of the negotiations will be definitely known in about sixty days.

Benson, Burns, Carmichael and Kell are running a tunnel and taking out rich ore in the Poverty Point section within a mile north of town.

Placerville, March 2d, '97.

Nevada.

Transcript: Mr. Epstein, one of the original owners of the Pittsburg mine, has purchased C. J. Bandman's interest and is now the principal stockholder. It is his intention to pay off all claims against the company and resume operations on quite an extensive scale. Work will begin in a short time, and a large force of men will be employed. Years ago the Pittsburg was considered one of the best mines in this district. There is a good mill and hoisting plant on the mine, and about 100 tons of ore on the dump.

Placer.

Sentinel: The last contract of 100 feet in the Gold Run tunnel was let last week. This distance will tap the 49th and 54th shafts, which is known to be rich milling ground.

At the Glen Consolidated gravel mine at Duncan canyon, on the Forest Hill divide, they have developed a well-defined channel. The gravel is coarse and heavy and runs from $3 to $10 a car, making an average of over $5. The company owns 550 acres, covering 12,000 feet of the channel. They have a breast about 80 feet wide, but the channel is over 100 feet wide. The gravel is blue and is soft and free. Very little powder is used.

At the Polifka the ledge is about 8 feet wide. It will be opened on a larger scale in the spring.

The Hidden Treasure Company have everything in shape now at Centerville for extensive operations. A larger force has been put to work. They are preparing to place an electric-power plant early next spring in the east branch of El Dorado canyon, near the mouth of the Hidden Treasure tunnel. They will convey 40 inches of water which flows from the tunnel to a point above the site selected for the works. The survey shows that 864 feet of pressure can be obtained. This will give them 75 H. P. The current will be transmitted to the Dam claim, a distance of three miles, and will be used to illuminate the mine and to furnish power for operating the blower, the forges and running the cars.

At the Red Point gravel mine the main working tunnel is now in nearly 10,000 feet. The gravel is yielding well and sixty men are employed.

Plumas.

Oroville *Register*: A telegram has been received from Supt. Wingate directing the Thistle Shaft mine to begin operations on the first of April and to pump out the water regardless of the expense. It is said if the Thistle Shaft mine cannot be successfully drained by pumping a mile tunnel will be run which will cost about $60,000.

No work to amount to anything is being done on the Gold Bar and other mines on the Middle Fork, but work will be pushed as soon as spring opens.

Work is being driven energetically at the Bunker Hill and North America mines under Supt. Meikle.

At Saw Pit there will be more mining done this year than for many years past and much of the work will be hydraulic mining.

Mr. Turner near Onion Valley has a good quartz ledge and has a strong company to back him in building a mill and working the mine.

Wingate & Alsby have struck a good ledge in the Slate Creek district and it is reported that a mill will be erected in the spring.

E. Squires will add a force of men as soon as spring opens at his mine near Gibsonville.

Independent: Charles Hegard of the Last Chance mine has completed the air shaft for the ventilation of the tunnel, which will be driven ahead as rapidly as possible.

National-Bulletin: Taylor Diggings hydraulic mine will soon be operated again. Mr. Wilson, the superintendent, sent out word last week to his foreman, Thos. Fant, to get the mine in readiness for active work as soon as the water season opens. The mine is a big proposition. Last year a deep bed of hydraulic auriferous gravel was developed. During the spring it will probably employ twenty or twenty-five men.

San Bernardino.

Los Angeles *Times:* The mines of the San Bernardino range are being worked to advantage. At the Rose they are drifting on the 700-foot level, taking out good ore.

J. W. Smart is working a rich stringer in Cook's canyon, assaying $200 to the ton.

O. G. Leach of the Black Hawk mining district has made a deal disposing of the Opera mine to R. F. Harrison, manager of the Rose, and the Llewellyn Bros. of Los Angeles.

Mr. Cochrane and others of Los Angeles have taken hold of the old Driscoll mine in Dry Lake district, and are down 75 feet in good ore.

Ed Dolch of Victor is having ore taken out of his mine that assays well.

E. C. Chappell is taking out ore from an adjoining claim.

The Valley Gold Company will resume operations in the spring under the management of W. E. Pedley.

The Green Lead people have struck ore that goes from $15 to $20 per ton.

Shasta.

Searchlight: The Minnesota mine, which has been idle for some time, will no doubt be started up during the present season. The ledge is from 3 to 6 feet wide where shown up by development work. The greatest depth reached so far is 400 feet. A 10-stamp mill is located on the property.

Supt. Von Krusze of the Sybil mine started his mill last week and is now crushing from twelve to fourteen tons of ore per day. There is ore enough in sight to keep the mill running for three or four months.

Courier: The Texas Consolidated is developed to a depth of 900 feet and is worked through a series of tunnels. No. 5—the lowest working tunnel—is about 1600 feet long, and is 650 feet vertical depth in the end.

Free Press: Supt. Frank Brightman is making arrangements to explore the Gladstone property with a diamond drill.

Manager Hill of the Mountain Copper Company has withdrawn his force of men sent to the Balla Klallala camp for the purpose of doing preliminary work pending a sale of the Windy Camp group of mines to the company, and the report is current that the sale will not be made.

Jackson and Perkins have discovered an extensive ledge on Muletown mountain, near the Markwick and Jones claims. The ledge is said to be 50 feet wide and can be traced for more than a mile.

Clendenin and Salnave are developing the Reid mine on Star gulch. A short time since they struck a rich ledge of ore in one of the tunnels.

Sierra.

Enterprise: At the North Fork drift mine good prospects have been obtained from the gravel. There are twenty-three names on the pay-roll, and day and night shifts are employed.

Sixteen hands are employed at Lucky Dog Ravine drift diggings. The gravel averages $3 to $4 a carload.

The new north tunnel, being run for the northeast part of the Bald Mountain extension, up the ridge, is in about 400 feet, out of the 845 feet to be put through to where the streak was left long ago in No. 15 upraise.

Siskiyou.

News: About twenty men are employed at the American bar mine putting in the wing-dam and fitting up for work.

J. G. Waugh has been constructing a ditch to bring water from Buckhorn to his high channel mine on Beaver creek.

The Bonanza on Grizzly gulch will be opened up this spring, some very rich ore having been discovered last winter.

Clute, Winsell and Neal have leased the Thompson placer mine on Hungry creek, and are on the ground operating it.

S. J. Fore, superintendent of the Last Chance mine, will begin putting in place the big elevators immediately. Mr. Fore will soon begin the erection of a stamp mill on the quartz ledge that he bought from Davis brothers.

The Columbia mine has a force of men at work taking out quartz.

The gentlemen who have a bond on the Allen mine in Quartz valley are meeting with success. On the 350-foot level they drifted north and found a good 4-foot ledge that prospects well. Compressed air is used for drilling and also for running the hoist. The quartz is crushed in a 10-stamp mill.

Spengler Brothers & Co. are starting up their mine, known as the Humbug Flume and Mining Company's property, at the mouth of Humbug creek, embracing 100 acres of ground.

Journal: Hunter & Smith are sinking a shaft on the Greenhorn blue gravel mine, working day and night shifts, with their steam pump ready to drain the claim on striking water. They will probably have to go down 100 feet, to reach bedrock.

Chamberlain & Timmons expect to commence work again soon at the Mabel quartz mine, between Oak and Scott Bar, adjoining the Columbia quartz mine.

The miners on Empire, Lum Gray and Dutch creeks, in the Honolulu section, Klamath river, are all busy ground-sluicing with very good success. Several good claims have been worked at the head of Empire creek, some ten miles from the river, this being the first season that the creek has been worked above Junkers.

Reid and Green, have found rich prospects on the summit of the Humbug range, west of Yreka, in galena ore, most of the Humbug ledges containing considerable galena, carrying gold.

Thos. Cartwright, has relocated the old Eliza quartz mine on north fork of Humbug. This claim yielded well when first worked.

Tuolumne.

Mother Lode Magnet: At the Santa Ysabel the tunnel is in 200 feet on the grouge and the ledge is expected to come in at every shot.

At the Dutch machinery for the additional ten stamps which they are adding to the mill is arriving. A new engine is being placed in the mill, which will furnish power to run the stamps, and a blower for the mine.

At the Miller & Holmes mine the large ore chute recently discovered is being blocked out so that stoping can be rapidly done as soon as the mill is erected.

At the Norwegian near Robinson's Ferry some rich rock has been taken out and a two-stamp mill is to be erected as soon as possible. Twenty men are now employed at the mine, and the force will be increased.

Banner: The Rappahannock mine is to have a 15-stamp mill.

A new mill is to be erected upon the Norwegain mine near Tuttletown.

The hoisting works at the Mariatt, near Tuttletown, are completed and the clearing of the shaft of water has commenced.

Union-Democrat: At the Golden Rule on crosscutting at the 500 level two veins were cut 250 feet east, and drifting on them is continued night and day. One carries a width of 16 and the other of 8 feet, and both break easy.

The Accident mine at Big Oak Flat, owned by the James Bros., has been bonded for $8000.

The main shaft of the Jumper has attained a depth of 310 feet and still sinking. Most of the ore sent up comes from the 200 and 300 levels where drifting is under way, and the twenty stamps are kept busy crushing.

The Punchbowl gravel mine in Table Mountain, owned by Jamestown people, and which has lain idle for over a year, will soon be again put in full blast by a company of Paris, France. C. E. Shafer will be the manager.

The Heath syndicate will soon resume operations on the Clio and Heath mines. These twin locations were proven good before, having an 8-foot well-defined ledge which was reduced at the little 5-stamp plant belonging to the company.

Independent: Machinery is being put in the Modoc mine.

Active operations have been commenced at the Confidence mine, under superintendency of A. MacDonald. The 30-stamp mill has twenty of its stamps employed night and day.

The Louisiana mine at Cherokee has been sold and the money paid, the purchaser being the California Consols, Limited, a Scotch company.

OREGON.

Medford *Monitor-Miner*: The Gray Eagle mine on Sardine creek is showing up well, having a large ledge that will mill over $20 per ton in free gold.

The Jewett mine near Grants Pass is turning out much fine ore and the ledge is growing wider and richer as the depth increases.

Rogue River *Courier*: The quartz mine known as the S. S. on Jump-off-Joe has been bonded for sixty days to Portland parties.

At the Jewett mine the ore body is now from 7 to 8 feet in width and getting richer all the time.

Blalock Bros. have been piping night and day on their Grave creek placers running two giants.

Muir & Green, of the Junction mine on Louse creek are figuring on a big ditch to take water out of Evans creek and carry it to the mine. They have filed a water right below the forks of the creek some seventeen miles from where it empties into Rogue river and contracted for preliminary survey.

Another carload of ore is being loaded at Merlin by Taylor & Crow. The rock has to be packed on horses fourteen miles, but the net proceeds at Ashland always repay the owners well for the trouble.

E. N. Williams of Gold Hill sold his placer ground on Sardine creek to some Colorado parties, who talk of putting in a ditch from Rogue river to increase the water supply.

A large custom mill, one able to handle the ores of this section, would do much to advance the interest of this camp. There are large amounts of ore on the dumps that would pay handsome returns.

The Flagstaff is sinking at the rate of 5 feet per day and the management expects to strike water in a few days.

Deep sinking is going on at the Columbia mine in the Virtue district, but water is retarding progress of operations. A pumping plant will be necessary to meet the needs.

The shaft of the Fagstaff mine is at a depth of 500 feet, equal to 460 feet vertical. A vein of ore 3 feet wide between walls was struck at this depth a day or so ago. The machinery for the new 10-stamp mill has arrived.

Baker City *Democrat*: Captain Clough has transferred all his mining interests in the Sparta district to F. W. Tallmadge of New York and his associates who propose to operate in a large scale. The properties transferred are the Eagle canal and quartz and placer claims. The Sparta or Eagle canal is a ditch about thirty miles in length constructed in 1871 by I. B. Bowen, Sr., and E. P. Cranston, to supply water from Eagle creek for the rich placer mines at Sparta and old Gemtown, then one of the most productive gold districts in eastern Oregon.

GRANT COUNTY.

The Red Boy is working fifteen men. They have a 10-ton mill and are taking from $6000 to $8000 out per month. It is the intention to put in a 10-stamp mill in the spring. They are now driving a 1000-foot tunnel to tap their ledges at a greater depth, and, if they succeed in striking what they expect, will need ten or twenty stamps more.

Two four-horse loads of iron pipe and giant arrived last week for the Grant Gold Mining Company. The giant is the largest ever brought to this section of the country.

J. W. Larkin has five men at work on the Boston, on Buffalo hill. He has secured the co-operation of Washington and Idaho capital and it is intended to thoroughly develop the mine.

UNION COUNTY.

Republican: The most extensive operations carried on in Union are by the Union-Companion Mining Company. A deep tunnel so located as to prospect nearly all the ledges of the mountain and which, when extended to a point vertically under the summit, will give back or stoping ground of over 2500 feet above tunnel level. Already 1200 feet of this tunnel has been driven and a large ledge of good ore found on the Union-Companion vein at a depth of 400 feet below all their workings. The mine produces from $14,000 to $20,000 per month. Ore runs from $9 to $25 per ton.

The Red Jacket, adjacent to the Union-Companion is in litigation. Several thousand feet of tunnel work opened up large ore bodies from which many thousand tons have been milled.

Many other claims on the mountain have extracted and reduced ore at the ten small custom mills in the camp.

The Keady mines on East Egale have uncovered several ledges of from 1 to 6 feet in width and have profitably reduced the ore in a 10-stamp mill.

In the Sanger district the Bradley mine has been operated for several years, and has produced over a half million dollars in gold. Active operations ceased last season. A deep tunnel from Eagle creek is projected that will save steam hoist and steam milling, thereby reducing operations to a minimum.

Three miles northerly from the Sanger or Bradley mine is the Basin, a recent discovery, equipped with a new 5-stamp mill and operated to a depth of 200 feet.

WASHINGTON.

Spokesman-Review: The Skookum Mining Company have commenced to get their machinery and supplies forwarded to the company's placer grounds, known as the Russian bars, on the Pend d'Oreille river. They have a new device on the order of a steam derrick with a grapple, bucket-shaped, for handling the gravel.

The Rightsides mine, owned by W. J. Stambaugh of Kettle Falls, has been bonded by Mr. Wize and other parties of Rossland,

B. C., for $15,000, and men are at work developing the claim. The ore is rich in gold and copper.

At Loomis, in the Palmer mountain tunnel, work is steadily progressing with a full force of men, as fast as can be expected by hand drilling, but the company hope soon to have an air compressor plant in position.

The Similkameen Gold Placer Mining Company will, in a few days, commence operations on the claims on the Similkameen river with their dredger to raise the sand from the bottom by centrifugal pumps, and run it over tables coated with quicksilver.

Dr. Langhammer, who took a bond on the Allison group last fall, has made an agreement with a Chicago syndicate by which a 100-ton daily cyanide plant is to be erected, provided the ore in the group averages $30 per ton; 120 assays made averaged $37.80 per ton, and if the titles are found perfect the syndicate will buy a controlling interest in the property and erect the reduction works.

The Roanoke Mining and Milling Company, a syndicate of Michigan City, Ind., capitalists, have miners at work on their claims on the south bank of the Similkameen river. It is the intention to continue the development work until the tunnels are run 500 feet. When the Roanoke tunnel has penetrated the mountain 500 feet reduction works will be erected of sufficient capacity to handle the output.

BRITISH COLUMBIA.

Spokesman-Review: For the first fifty days of the present year the Le Roi mine has averaged in shipments 100 tons of crude ore daily. Now, since the compressor is in operation, and the gravity tramway ready for business, when the new hoist is in position and operating the output of the Le Roi mine will be increased fourfold.

In the Center Star, which adjoins the Le Roi, the main tunnel is now in over 1400 feet, and is within 70 feet of the east end line of the Le Roi.

On Monte Cristo mountain the mines are being developed night and day. No less than four mines on this hill are being developed by power drills. They are the City of Spokane, Colonna, Monte Cristo and Iron Horse.

The Walters Company has secured an option on a four-fifths interest in the Pilgrim for $80,000. The bond is to be taken up on March 4. It is understood that the Walters Company is acting in the interest of Toronto and Montreal capital. This company also hold a bond on the Gem and Tiger fractions, which adjoin the Pilgrim, and it is their intention to consolidate the three in one company. This will give an area of about twenty acres.

Nelson *Miner*: The following is the product of the mines of the Kootenay country for this year up to February 20:

ORE EXPORTED.

	Tons.
From Slocan via Kaslo	42423¼
From Slocan via Nakusp	1597½
From Rossland via Northport	2670¾
From Rossland via Nelson	16¼
Total	8538½

Total value—

Through Nelson custom house	$489,477.94
Through Revelstoke (Nakusp)	174,416.65
Total	$663,894.59
Average value per ton	77.77

PRODUCE OF SMELTERS (SHIPPED).

	Tons.
Nelson (Hall mines) matte	357
Trail smelter matte	1304¾
Total	1661¼
Total value	$ 632,906.00
Total value ore and matte exported	1,296,800.59

ALASKA.

Mining Record: There arrived Feb. 10 the first party this winter from the Yukon country. Speaking of the shortage of supplies at Circle City, they say there is plenty of nothing but sugar. Flour has sold as high as $50 per hundred.

A greater amount of winter drifting than ever before has proved profitable on Eagle creek.

Of the Clondyke strikes, they say the Clondyke river is a stream about forty yards in width at the point of its confluence with the Yukon, about fifty-five miles above Forty Mile, and is about such a stream as Forty Mile creek. Its principal tributaries are Bonanza and Hunker creeks, each about twenty miles in length. The gold of this district is invariably found in the beds of the streams, there being no bench diggings. The pay streak runs from 3 to 6 feet deep and lies under from 12 to 20 feet of gravel, and the district is distinctly and entirely a winter diggings, sinking and drifting being only practicable when the gravel is frozen.

One hundred and ninety-two claims are staked out along Bonanza creek, extending a distance of twelve miles, 102 miles below and ninety miles above the discovery claim.

The gold of the Clondyke section is coarse and dark, carrying considerable adhering quartz. A number of nuggets taken out on Bonanza creek will weigh from $3 to $13 each.

Claims are allowed extending 500 feet along the streams, from rim to rim, and the Canadian authorities demand a fee of $15 from the locator of each claim. The best claim thus far opened up on Bonanza creek is No. 22 above discovery, which was sold by P. C. Richardson for $6000, half cash, balance "on bedrock."

News: The class of capitalists who so far have invested here are men with means to put their acquisitions on a paying basis. Of that class might be mentioned the Julian Mining Company, which built a 10-stamp mill at Berner's bay last fall; the Nicolai Company, which will build one this spring of like size on the Horrible lode; the Bald Eagle Company, the Sum Dum Chief Gompany, the Windham Bay Company, the Ebner Gold Mining Company and the Boston & Alaska Company, which has just begun operations at Funter bay. The latter gives promise of developing into a plant second in magnitude only to the Treadwell Company.

The Sum Dum Chief Mining Company has begun active work for the season. A complete 10-stamp mill has been ordered, workmen are framing the mill timbers, and everything will be on the mill site ready for erection by March 15.

The Nowell Company has under consideration the addition of fifteen stamps to their Sheep creek mill. There will be a large mill built on the Ready Bullion claim this summer and probably one on the 700-foot claim adjoining Treadwells. The Mills property, on the north shore of Holkham bay, now under bond to a French syndicate for $250,000, will be thoroughly developed early in the season.

UTAH.

TINTIC DISTRICT.

(Special Correspondence).—The Tintic Mining and Development Company is driving a tunnel into Mammoth mountain to tap the Sioux vein, which they expect to strike by going 4000 feet. This is to be a royalty tunnel, but the company expect to cut through their own ground at 2100 feet from the mouth, at 1400 feet depth.

The Emerald shaft is down 455 feet. Some drifting is being done, and several chutes of low-grade ore have been found. The purpose is to sink 700 feet.

The Grand Central, lying adjacent to the Mammoth, on the same side of the hill, has a shaft down 700 feet; has 1000 feet of drifting on the 200-foot level and is in ore; has 500 feet of drifting on the 400-foot level and 800 feet at the 700-foot level. The property is well equipped, and, while not now a shipper, there is strong likelihood of its soon becoming one.

The Apex is a promising prospect on the south slope of Mammoth hill. Its owners are doing some systematic work prospecting for the Centennial-Eureka vein, which is on the opposite side of the hill.

At Silver City, the Silver Park tunnel is in 800 feet and a shaft is being sunk. The management contemplate putting in hoisting machinery.

The Four Aces shaft is down 485 feet, is equipped with a gasoline hoisting engine and has shipped some carbonate-lead ore. Levels have been run every 100 feet. Ores on the lower levels are said to run as high as 80 ozs. silver and 30 per cent lead.

The South Swansea shaft is 450 feet deep, with levels every 50 feet. The workings connect with those of the old Swansea. The work now in progress is principally development and blocking out the ore. Ore on every level has been found, which is silver-lead sulphate. Very little of it is oxidized. The ores of this part of the district are in porphyry and run 40 ozs. to 60 ozs. silver and .20 per cent lead, though some of the high grade runs as high as 120 ozs. silver. The South Swansea is shipping about 300 tons per month. The old Swansea shaft is down about 600 feet, and production and development goes steadily on.

WASCOTT.

Mammoth, Utah, Feb. 16th, '97.

Mercur *Mercury*: Lillian Russell shaft on the La Cigale is going down at the rate of 6 feet a day, and the drifts north from the 100 and 200-foot levels are being driven at a like rate of speed. The plans of the company for a mill are completed, and early in the summer ground will be broken for its erection. The mill will have a capacity of 500 tons, and will be complete in all its details. The ore will need no handling after being hoisted, the machinery taking it from the ore bins to the crusher, the tanks, and will even carry it out on the dump.

The Wonder shaft was down last week to a depth of 650 feet.

Kislingbury, Jenkins and Clements have been sampling the Sacramento in the interest of Capt. De Lamar. Manager Bothwell says that no option has been given on the property, nor any price quoted.

Salt Lake *Tribune*: The output from the Bullion-Beck property at present is perhaps larger than that of any bonanza in the State, the shipments of crude ore amounting to about 2500 tons a month with the concentrates reaching a total of nearly 1000 tons. It is said of the ore that rarely has its values exceeded those of the present time, the high grade showing an increased amount of gold as depth has been attained, while the argentiferous values have maintained a uniform figure.

On the West Dip at Mercur extensive development work is being done, with most gratifying results. The showing at the La Cigale continues as work progresses, as do the Daisies and there is every indication that the rush to that locality will increase with the opening of spring. The snow there is yet at such a depth as to render intelligent prospecting almost impossible, although hundreds of claims have been staked off.

The Mercur Mining Company will within two weeks increase the capacity of their milling plant to 300 tons daily. To accomplish this will involve but little expense, the only thing necessary being an increase in the tankage and a heavier crusher. At present the mill is handling a little over 200 tons a day that afford a monthly dividend in the sum of $25,000, and with the increase the impression prevails that this will be swelled to at least $37,500.

At Frisco the mill upon the property of the Horn Silver Mining Company, which has paid over $5,000,000 to its stockholders, has been shut down, and about 100 employees at the mine and concentractor laid off. At the offices of the company in this city it is claimed that the shut-down was simply to enable the management to make needed repairs on the mill, and that this having been done the property would start up again.

All three of the Salt Lake smelters are quite busy in turning out bullion, and their ore supplies keep up well. The past few years there has been such sharp competition in smelting as to necessitate the adaptation of labor and fuel-saving devices to cut down the cost of reduction of ores into bullion and matte.

The Chloride Point Consolidated Mining and Milling Company have decided to erect a 100-ton mill at their property in the Camp Floyd district, and it is understood that the work of construction will begin at an early date.

MONTANA.

Manager Knippenberg in his annual report of the Hecla Consolidated Mining Company shows the production for 1896 to have been: Silver, ozs., 382,735; lead, lbs., 2,776,805; silicia, lbs., 3,358,039; iron, lbs., 1,510,520; zinc, lbs., 1,784,495. The net value of bullion and matter shipped during 1896 was $283,474.90, which with receipts from other sources made up a total of $286,823.19. The expenditures, not counting dividends, were $249,950.31, leaving a net cash profit of $26,372.88.

Inter-Mountain: The Montana Ore Purchasing Company are negotiating for the McNamara interest in the Snohomish mine for $75,000. The property is now being worked under lease, and is developed by a shaft 450 feet in depth and numerous crosscuts and drifts.

Miner: At the Bi-Metallic mine in Granite county, which has produced $32,000,000, and has paid $12,000,000 in dividends in nine years, the machinery for starting to work over the tailings that have accumulated for so many years, is about ready and it is said that the mill will not again shut down. After the tailings are used up it is probable that the mill will be kept running from the ore that is taken from the mines.

On the High Ore work has been suspended on the tunnel, which is in 1,185 feet. In driving several veins carrying good values in gold, silver and lead have been cut. The objective point of the tunnel is still about 400 feet ahead. It is expected that work will soon be resumed.

SOUTH DAKOTA.

Black Hills *Times*: P. L. Gibbs, principal owner of the Omega mine, adjoining the Homestake, is negotiating for the erection of a leaching plant in connection with his stamp mill situated at the mouth of Blacktail on Deadwood gulch. The new plant will be operated under the cyanide or chlorination method.

G. W. Drew and M. V. Little of Chicago, associated with D. C. Boley, who have recently purchased the Carroll group of mines, on the Blacktail divide, and the Sunset property, west of the Gunnison and Clinton groups, propose to erect a large and suitable works for the treatment of the product of their mines, and of sufficient capacity to handle custom ores.

A new discovery of siliceous ore is reported to have been made in the vicinity of Hill City, two miles from the Sunnyside mine. The locator claims to have a vertical vein 8 feet wide that he has traced by openings on its course for 4500 feet in length.

At Keystone the Holy Terror Company employ about fifty men. The shaft is in the vicinity of 475 feet and is being pushed as fast as possible. The mine is a steady and large producer.

The Union Hill Mining Company are getting the Richmond mill in shape for the reduction of gold ores. Twenty stamps are now in position and will be dropping in a few days. The mill will be equipped with four different makes of concentrators to test their ability and capacity. The one giving the best results will be adopted and a full complement of them will be placed in position. The mill when completed will have eighty stamps.

COLORADO.

Denver *Republican*: At Cripple Creek on the Strong mine on Battle mountain the shaft is down 500 feet and the foundation has been prepared for a new 12x14 geared hoister that will see the shaft down 1000 feet deeper.

C. B. Wider has secured the Raven hill group of the Cresson Company under a bond and lease, and put a force to work prospecting the ground. The group contains thirty-four acres and ranks among the best of the indifferently prospected territory on Raven hill.

The old Eaton shaft on the Gold Dollar has been unwatered and sinking resumed. In the prospecting tunnel run, about 50 feet away from the shaft, what is undoubtedly the extension of the Lindsay-Lanterman vein has been opened, and assays from 10 inches of the ore range from $90 to $1500 a ton.

J. J. Weicher of London has purchased the bond and lease on the Caledonia on Gold hill from the Six Brothers Company, and the property is now being operated for him by the McMasters brothers, while the final sale of the property is being negotiated in London.

The Elkton during the first eighteen days in February shipped 27 cars of ore, including all grades. The Moon-Anchor Company during the past week shipped 143 tons of ore.

At Ouray the Cleopatra Mining and Milling Company announces to owners and operators of mining property tributary to Ouray that they will erect during the next three or four months smelting works for the reduction of copper sulphide, iron sulphide, siliceous and lime ores. They expect their first furnace will be in operation early in June.

The O. & N. tunnel, which has cut the American ore measures on the gold belt, shipped out a single car recently which netted over $9000 in gold.

At Leadville shipments have commenced from the newly opened Henriett shaft. A force of twenty-five men were put to work breaking ore in the third and fourth levels, about 450 feet from the surface. The ore is a lead carbonate, and recent assays show an average value of 12 ounces silver and 39 to 40 per cent lead.

NEW MEXICO.

The Baldy district has been a large producer of gold since 1866, and the product has been well up into the millions, while gold was taken from the placer workings under Spanish rule as early as 1640, and for forty years thereafter. A large portion of the district, and all of that portion which was known to be gold-bearing up to three years ago, is embraced within the Maxwell land grant, the title to which has been in conflict for many years. This was a complete bar to the investment of capital to develop the well-known rich leads. Happily, the question of title has been absolutely settled by an act of Congress, and in 1894 the district was thrown open to prospectors under conditions very similar to those relating to the location of mineral claims on government land, and in most respects more favorable. Since then thousands have gone into the newly opened fields, which have been demonstrated to be rich in gold. This includes the La Belle district, the Red River district, the Keystone district and the Hematite district.

The Aztec mine was discovered by Matthew Lynch and others in 1867, and in about nine years' working is reported to have produced over $1,250,000. This property has over 2000 feet of underground workings, most of it ready for stoping, and is said to have over 40,000 tons of ore in sight.

Other old mines in the vicinity of Baldy are the Montezuma, Rebel Chief, Legal Tender, Black Horse and French Henry groups, besides many others more recently developed. The capacity of the mines in this district, if worked to the fullest extent, is not less than 1200 tons of ore daily. Seven stamp mills, with over 200 stamps, are in operation in the district.

The Bandanna group, near Elizabethtown, consists of six very fine claims, upon which there are 500 feet of shafts and 3000 feet of tunnels, developing eight well-defined veins, ranging from 8 inches up to 3 feet in width of high-grade ores, and from 5 to 8 feet in width of ore.

On the Golden Ajax a 10-stamp mill has been in operation since last June, but has not been entirely successful in saving the values, and a concentrating plant is now being put in to handle the tailings.

In the Red River district a thirty-ton smelter was erected last November, which will be a great factor in developing the district the coming season; and though it can handle only a small portion of the ores produced, it will give a practical demonstration so much needed in all new mineral fields.

The placers constitute one of the chief sources of gold in all of the districts. The Lynch placers at Elizabethtown have been operated since 1866, and comprise a tract of about 7000 acres, carrying an average of 18 feet of auriferous gravel running not less than 30 cents per cubic yard. These placers and others in the immediate vicinity of Baldy mountain have produced more than $2,000,000. The Lynch placer is operated by a ditch 42 miles long, which cost originally over $300,000, and by two shorter ditches, which furnish a large volume of water. The Franklin placers comprise over 800 acres of ground on Red river. Over $20,000 worth of improvements were completed late last fall. The Montezuma placers, on Red river, were operated profitably last season. Near the head of Red river are the Long Canyon and Black Tiger placers, located last season and operated in a small way. In the La Belle district a Boston company, which located a number of placer claims last season, has recently purchased all the adjoining placer ground and in the spring will construct a ditch from the Costilla.

ARIZONA.

Globe *Silver Belt*: Between the Verde and Jerome there are over sixty men prospecting, most of them having gone there recently on account of the striking of a large ledge, assaying high in gold and silver.

John W. Garrett of the Baltimore & Ohio Railroad, Arthur A. Brownlee of New York and Thomas R. Lombard of Chicago, through the efforts of W. O. O'Neill of Prescott, have become interested in the Grand Canyon copper mines, owned by F. R. Nellis and others. The bond covers twenty claims and runs eighteen months, the price fixed being $85,000.

Mr. Backstein, who has bonded several mines in the Lone Star district, and who went to St. Louis recently to buy a smelter and other machinery, has made the purchase and the machinery is now in transit.

There are sixty men employed extracting ore and freighting it to the Rosemont smelter, which, it is expected, will blow in in a few days.

Tucson *Star*: At the Pierce mines the out put is larger than ever before. Two pulverizing mills have been purchased and are in transit and will be erected and in operation within sixty days. The capacity of these mills is fifty tons each, making a total of 100 tons per day.

Journal-Miner: A shipment of $20,000 in gold bullion was made last week from the Harqua Hala mines.

The Sundance Company is awaiting the arrival of new machinery for their mill, which they propose to erect at their Silver Trail mine.

Despite the reports to the contrary, the present lessees of the Bonanza mine, at Harqua Hala, will probably make application for a renewal of the lease at the headquarters at London. Ten stamps are kept running twelve hours per day.

Phœnix *Republican*: The shaft of the Congress mine is now down more than 1700 feet and has been in pay dirt all the way.

The copper mines near the Grand canyon, back of Flagstaff, are bonded to Eastern capital and are developing into big producers.

It is reported that Wm. Stiles and Felix Mayhew of Casa Grande have sold their recently discovered copper property, a few miles south of that town, for $60,000, and that a smelter will be placed on the ground at once. It is understood that the Silver Reef properties have just changed ownership for a consideration of $75,000.

Scientific Progress.

The Quacks and Electricity.

In a recent address Dr. George M. Sternberg spoke on "Pseudo Science in Medicine," and described the use made of the electric belt, "microbe killer" and the X-ray by the army of quacks "who trade upon the imperfect knowledge of the masses, and by plausibly written advertisements convince many, even of the educated classes, that their particular method of treatment is based upon the latest scientific discoveries." Continuing, Dr. Sternberg says:

"A Franklin draws lightning from the clouds; a Galvani shows that an electric current may be developed by the contact of metals, and that such a current causes muscular contraction, and innumerable patient investigators add to our knowledge of electricity. The scientific physician avails himself of this potent agent for the treatment of certain ailments in which it appears to be indicated, but admits that he meets with many disappointments in his clinical experiments. The pseudo-scientific quack writes, or has written, advertisements in which fact and fiction are so commingled that even educated persons may be deceived, and, having aroused interest in the alleged therapeutic value of this mysterious agent, offers his electric belt or finger ring made of two metals, or pocket battery, as a sure cure for certain specified ailments, or, if less modest and more certain of the credulity of the public, as a cure for all of the diseases to which man is subject."

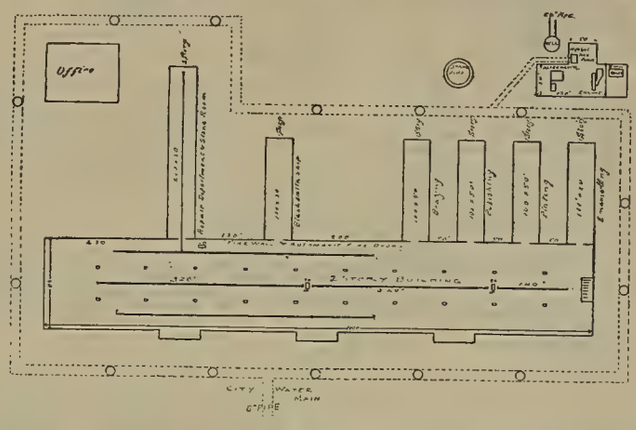
METALLURGISTS now think they know why a piece of red-hot tool-steel becomes flint hard when suddenly quenched in water. For years they have been satisfied with the explanation that the shock drove the molecules of the steel into closer contact, hence the hardness; but this theory was completely destroyed by the fact that the volume of the hardened steel was greater than that of the unhardened material. After five years' search the metallurgical department of the Sheffield Technical School has solved substantially this difficult problem. It had been necessary to employ very intricate physical apparatus, the object of which was to measure accurately what seemed a paradox, namely, how much hotter a piece of steel became on cooling, and how much cooler it became on heating. These phenomena were due to the formation or dissociation of compounds within the steel itself. The result of the researches showed, almost beyond doubt, that the almost diamond hardness of quenched steel was due to the presence of a remarkable subcarbide of iron, and that the action of tempering was due to the fact that far below red heat this compound decomposed and diluted the mass with soft iron. The permanent magnetism of steel depended on the amount present of this compound.—Mechanical Engineering.

AN English exchange tells of a remarkable invention it is proposed soon to bring out in England called petrifite. It is stated to be a combination of well-known inexpensive substances which has the property of rapidly binding together or solidifying, without pressure or mechanism, almost any materials that can be named. It is said that even water itself, fresh or salt, and most liquids become solidified and transformed in twenty-four hours into insoluble stone or rock. The invention, which can be used either as a perfectly white powder or as a liquid, is added in varying proportions as required. An ordinary mixing mill and a pulverizer are the only machines necessary for the manufacture on a large scale, and smaller quantities may be treated by hand alone. Among the numerous applications to which it is claimed that petrifite can be made may be mentioned buildings, paving, aqueducts, reservoirs, tunnels, embankments, bricks, tiles, concrete and cement. It is thought that it may also be used as a binding material in coal briquette manufacture, one part of petrifite to thirty or even forty parts of dust, making a solid briquette without pressure. Where a hard briquette is required it is advisable to use the present ordinary briquette presses instead of increasing the proportion of petrifite.

Electrical Progress.

Unique in Its Motive Power.

An interesting installation is now under way at Middletown, Conn., where the Keating Wheel Co. have completed a factory unique in its construction and in the application of its motive power. When complete the factory and offices will cover a space of 168,250 square feet, of which about 150,000 square feet will be devoted entirely to bicycle manufacture. The establishment is divided into three buildings of brick and stone. The main building is 1000 feet long, 50 feet wide and two stories high. Projecting from this on the river side are six Ls, each one of which is devoted to some special operation on the wheel. Reference to the plan shows the different apartments which occupy these Ls. The main L—200 feet long, 50 feet wide and two stories high—is the repair department and the store room.



The unique feature of this factory lies in the fact that it will be entirely operated by electricity, not an engine or a main belt coming into the factory proper. The system chosen is the three-phase system of the General Electric Company, now in use in many power transmission and distribution plants throughout the country.

The engine and generating plant are located in the southeast corner of the plot in a two-story brick and stone building. Steam is generated by a Babcock & Wilcox boiler of 250 H. P., separated by a brick partition from the engine room. The engine—of 500 H. P., the high pressure side only of which is installed—is erected upon the second floor upon brick and stone cap piers built up from the ground. On the same floor is a General Electric three-phase generator, known as an A-T 16 pole, 250 kilowatt, 450 revolution, 60 cycle machine, also placed on piers carried up from the ground. The main belt from the engine and fly wheel passes down to the ground floor, where a countershaft runs in bearings set upon brick and stone piers. The shaft is carried the entire length of the room and from it will be driven, eventually, another three-phase machine, probably of similar capacity, as well as a set of lighting machines.

The exciter for the generator is a 4½ kilowatt machine of the I. B. type, run from a pulley on the shaft of the three-phase machine.

The main building, 1000 feet long, is one great hall, supported on rows of pillars 10 feet apart. It will be seen by the diagram of the building that the main shafting is about 800 feet long and runs down the central aisle, being divided into three sections, between each of which is a 50 H. P. General Electric induction motor of the inverted type. There are other shorter lines of shafting, which are about 350 feet long, one on each side of the main shafting in the north part of the building. Still another line of shafting, about 250 feet long, runs through the repair department. The motors driving the shafting in the main building are two 50 H. P., while the line of shafting running through the repair shop is driven by a 20 H. P. motor, secured to the ceiling of the first floor in the main building.

All of the motors are equipped with two pulleys on each end, so that four independent shafts can be driven from each motor. The extent of this shafting and the method of driving the motors can be gathered from the illustration made from a photograph taken from one end of the main building. There is about 160 feet of shafting on the other side of the far motor shown in the picture. This will give some idea of the extent of the installation.

LAYOUT OF THE KEATING FACTORY AT MIDDLETOWN, CONN.

VIEW OF KEATING FACTORY JANUARY 30, 1897.

FIRST FLOOR OF MAIN BUILDING; ROOM 1000 FEET LONG.

THE world's submarine cables now number more than 1300, according to the recent presidential address to the London Institution of Electrical Engineers. They have an aggregate length of 162,000 nautical miles, over half of them being less than five miles long, while eight of them exceed 2000 miles. They represent a total expenditure of about $200,000,000, about 75 per cent of which is British capital. A fleet of forty-one repair ships is maintained. The electrician can localize the breaks in a cable closer than the captain can sail his vessel, yet a break on one of the Anglo-American lines costs almost half a million dollars to mend—this being probably the most expensive repair on record. It is possible to transmit nearly fifty words of five letters each per minute on the Atlantic cables by an automatic transmitter.

Mechanical Progress.

Improved Method of Filtration.

Frank H. Mason, United States Consul General at Frankfort, Germany, writes that there is in operation at Worms, Kiel and several other places in Germany an improved system of filtration of water on a large scale. The new system is the invention of Director Fischer, waterworks engineer of the city of Worms, where the use of Rhine water for general purposes presented the same problem that confronts cities like Cincinnati, St. Louis, Cairo, and others which derive their water supply from the often turbid rivers of the Mississippi valley. The germ, or fundamental idea, upon which the new system is based is the fact that clean, sharp sand, when mixed in due proportion with finely pulverized glass, which may be derived from the waste of glass works, old bottles, etc., forms a porous mass, which, by baking under a high temperature, may be hardened in any desired form. The inventor in this case hit upon the plan of molding this porous cement into hollow plates, or plaques, about 40 inches square and 8

inches thick—that is, with walls 3 inches in thickness and about 2 inches of hollow space at the center of the plaque.

In constructing the filtering plant, these plates are set upright in groups or batteries of any number, according to the desired size and capacity of the establishment, and are ranged along the lower portion of one or more tanks of hydraulic masonry, where they can be covered to a depth of 3 or 4 feet with the water to be filtered. The water is then forced by its own pressure through the porous walls of the plate into the interior hollow space, where it trickles down and is drawn off through pipes, laid at the bottom of the tank, to the reservoir which receives the filtered water. These discharge pipes are rigged with cocks so that each plate and group of plates may be isolated for cleaning or other purposes while the adjacent batteries are in operation. For greater economy of space and tubing, two tiers of plates are set, one above another, in the usual manner, whereby both tiers are served by one set of discharge pipes. The water, in passing through the 3-inch walls of vitrified sand, is filtered as perfectly as by traversing 3 feet of loose sand or gravel in the ordinary sand-filtering process. The plates, being set upright and close to each other, increase from eight to ten fold the filtering surface that may be condensed within any given superficial area, thus securing an important economy of space within frost-proof constructions, and where, as is often the case, land is costly and difficult to obtain.

Nor is this the only, or even the principal, advantage of the new system. Every practical waterworks engineer knows the delays, labor and expense involved by turning sand filters out of circuit and cleansing them of the mud and detritus which collect so rapidly at the bottom of the tank. With the plaque filter, the cleansing operation is easily and quickly performed by simply reversing the current of water, that is, turning it backward through the discharge pipes into the hollow plates, whence it percolates outward through the porous walls into the tank, dislodging readily the dirt that has collected on the outer surface. This falls to the bottom of the tank in which the plates are submerged, and is draw off in liquid form, assisted, when the accumulation is large, by means of a hoe or shovel, and followed by flushing with a hose.

Practical Information.

Pig Iron Production.

So far the available statistics enable a conjecture to be made of the pig iron output of 1896. It is likely to be by far the largest on record. The best estimates that can be made place it at 30,500,000 tons, of which the contributions that can be appraised with apparent confidence are the following:

	Tons.
Great Britain	8,650,000
United States	8,623,000
Germany	6,200,000
France	2,250,000
Russia	1,600,000
Austra-Hungary	1,300,000
Belgium	650,000
Sweden	550,000
Total	30,123,000

And when to this we add contributions from Canada, India, Italy, Spain, China, Japan, Mexico and other countries, we can depend upon it that we are rather under than over the mark. —Iron and Coal Review.

A SPECIAL from Chicago over the Chicago, Burlington & Quincy and the Burlington & Missouri railroads reached Denver, Col., at 3:52 A. M. Feb. 16th, having traveled 1026 miles in 18 hours and 52 minutes. This journey goes into history as the greatest railroad feat ever accomplished. On straight stretches of track the train covered more than sixty miles an hour. The mountain climb from Akron, Col., to Denver, 118 miles, was made in 124 minutes, the train running an even mile a minute much of the distance. This record is considerably better than any previously made. The average speed was .906 mile per minute. The record before had been held by a New York Central special, which made the run from New York to Chicago, 964 miles, in 19 hours and 57 minutes (1197 minutes), an average of .805 mile per minute.

ALUMINUM BRASS is used extensively in places where strength is required, especially in electrical work and the electrical attachments for wires on trolley work, both overhead and underground. The use of aluminum also makes brass very tough, and one can take brass with a few per cent of aluminum in it and bend it into all sorts of shapes and forms without breaking it; whereas, without the aluminum, it would not stand one-half the amount of work which it will with it.

THE OVERLAND LIMITED,
VIA
UNION PACIFIC.
Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco

Two Big Bargains!

STEAM SHOVEL
FOR SALE.

First-class machine; nearly new; ample power to handle anything but solid rock; cost $7000; was set up but never used; will be sold for $2000; can be bought with or without 50 H. P. boiler.

A Bennett Amalgamator.

Cost originally over $7500; in fair condition; can be bought for $1600. For particulars as to capacity, location, etc., address

MINE BELL SIGNALS.
Adopted, Used and In Force in Accordance with State Law.
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

Send for Circulars and Price List.

'49 DIGGIN'S.

155 acres of virgin ground on the famous Columbia channel. No "cap," all pay gravel. Free water and room to store debris. A hydraulic proposition. Title, U. S. Patent.

QUARTZ MINES: 14 inches of $20 ore to 30 feet of $10 ore. All at the miners' prices.

Jan. 25, '97. E. H. SCHAEFFLE, Murphys, Cal.

Coast Industrial Notes.

—J. H. Wadsworth is erecting an artificial ice plant at Yreka, Siskiyou county.

—The Government of Colombia has voted 6,000,000 francs for the purchase of more warships.

—Receiver Clark has contracted for 15,000 tons steel rails for the Union Pacific and 5000 tons for the Oregon Short Line.

—The Los Angeles Edison Electric Company has called a meeting of stockholders for March 20th to authorize the issue of $500,000 bonded indebtedness.

—A corporation has been formed, called the Truckee & Lake Tahoe Railroad Company, for the purpose of building a road to the lake, with a terminus at Tahoe City. The directors are capitalists of Nevada or men who have been prominently connected with the Comstock.

—The Arizona Legislature is asked to grant exemption from taxation for ten years to a proposed railroad to the Globe district, to be called the Santa Fe, Phœnix & Globe. Globe is one of the best mineral regions in the West. For years it has thrived with hauling done 120 miles. Even now hauling is done seventy miles.

—Dr. Thos. Addison, coast representative Gen. Electric Co., considers as almost definitely assured the plan to establish a large electric plant at the Corral Hollow, Cal., mines to furnish light and power to Oakland, Berkeley and Alameda. The scheme includes the building of forty-two miles of line and the generation of 10,000 H. P. at the mines.

—The regular rumors of the usual annual "fishermen's strike" are reported from Astoria, Or., where the most profitable business on the coast is conducted. From a little strip of water is annually lifted $3,000,000 worth of salmon, it being all harvest, there being no sowing or cultivation. The canners and fishermen have a chronic grievance against each other, and all efforts to induce a good understanding and business co-operation are thwarted by a few on each side, who find profit in fomenting discord.

—At the beginning of the work on the Transsiberian Railway, the Transbaikal and Amoor section was planned to extend from Chita through Sretensk, on the shores of the river Shilka, to Pokrovskaia; thence along the northern shore of the river Amoor to Khabarovsk, to join the Ussuri Railroad, (running south to Vladivostock). But investigation clearly showed that the construction of a line in that section involved such technical difficulties as would greatly increase the cost of the undertaking. Thus, for example, on the Sretensk-Khabarovsk section, 1667 versts (1105 miles) long, the cost per verst (0.663 mile) would amount to the sum of 90,000 rubles ($46,260). This first raised the question of building the Transsiberian Railway through Chinese territory, and investigation made in Manchuria showed that it would not only cheapen and shorten the construction of the road, but would present other advantages. Negotiations were begun on this subject, and the result was that the Chinese Government gave a concession to the Russo-Chinese Bank, and a new company, called the Eastern Chinese Railway Company, was formed, which is to construct and work a railway within Chinese territory. The articles of association of the new company were sanctioned by the Czar Dec. 16, 1896, and by an imperial ordinance issued on Dec. 23, 1896. The details of the arrangement are these: The association has been organized on the strength of the convention concluded Aug. 27, 1896, by the Chinese Government with the Russo-Chinese Government Bank for the construction and exploitation of a railroad within the boundaries of China, from a point on the western frontier of the province of Heilung Chang to a point on the eastern frontier of Kirin, and to be connected with the branches of the Transsiberian Railway which the Russian Government intends to build. The company may, with the permission of the Chinese Government, work, in connection with the railroad or separately, coal mines and other mining, industrial and commercial enterprises in China. In case such enterprises should be worked independently of the railroad, then the company must keep a separate set of books for each of them. The Russo-Chinese Bank takes upon itself the duty of organizing this company, and, when the same is organized, all the rights and duties concerning the construction and exploitation of the line granted by the abovementioned convention are conferred upon the company. The company will be considered organized as soon as the Government Bank presents to the Minister of Finance proof that the founders of the company have paid in their first installment of the shares, and they should be paid in not later than two months after the confirmation of the articles of association. The balance of the shares should be paid in, according to their nominal value, not later than a year after the organization of the company. Shares can be held only by Russian and Chinese subjects. According to the convention, the company will own the Chinese Eastern Railway during eighty years after the opening of the whole line. The new line will begin at the Onon station of the Transbaikal Railroad and will cross the Chinese frontier near the town of Staro-Zurukhait; it will run in Manchuria toward the towns of Cicikar (Tsitsikar), Khu-lan-Chen and Ning-tu and connect with the Nikolsk station of the South Ussuri Railroad. The total length of the Manchuria Railway will be 1920 versts (1273 miles), of which 1425 versts (945 miles) will be in Chinese territory.

Mention The Press and address *Illustrated Weekly Sentinel*, Denver, Colo.

Personal.

RUSSELL L. DUNN is in London, where he went from Paris after his return from Siberia.

THE new office of Manager Graham of the Vulcan Iron Works of San Francisco is at 505 Mission street.

CAPTAIN GILLETTE, of the United States Debris Commission, has been in Plumas county, Cal., inspecting dams.

D. H. JACKSON of Oakland, Cal., will next week resume active operations on his El Dorado county property.

LIEUT. R. E. LOPEZ of the Washington navy yard is ordered to the Union Iron Works of San Francisco as inspector of ordnance.

CHARLES F. HOFFMAN, accompanied by his son, Ross, reached St. Petersburg, Russia, January 1st, on his way to Siberia. The mines he goes to are on the Amoor river.

BERTRAM HUNT, California and Nevada agent of the Gold and Silver Extraction Co. of America, L'Ud., has moved his office from 23 Stevenson St., to 216 Sansome St., San Francisco.

PROF. R. A. F. PENROSE, president of the Commonwealth Mining Company, is a candidate for the Governorship of Arizona—an appointment that will be made by President McKinley.

JAS. SPIERS JR., of the Fulton Engineering and Shipbuilding Works, has returned from the Confidence mine, Tuolumne Co., and from practical experience realizes the need of road improvement.

HORACE F. BROWN, M. E., of Chicago, who has been putting in one of his roasting furnaces at the Planet-Saturn mine, Arizona, is visiting El Dorado county, Cal., which he first saw thirty-eight years ago.

WILLIAM HAMMOND HALL, of this city, formerly State Engineer of California, has been in London for some time past, and last week sailed for South Africa with John Hays Hammond. He goes to make an examination of the water supplies of the Rand for the Consolidated Gold Fields, or the Rhodes outfit.

BINGER HERMANN of Oregon is slated as Mr. Lamoreaux's successor as commissioner of the general land office. Mr. Hermann has served twelve years in Congress, is thoroughly conversant with the requirements of the position, is friendly to the mining interests of the coast and not likely to be influenced in the manner so painfully peculiar in the case of Mr. Lamoreaux.

L. P. GOLDSTONE, of Grass Valley, has returned from London and will leave on the next steamer bound for Australia, where he goes to take the management of some promising properties for Bewic, Moreing & Co., one of the heaviest firms there and who deal in mines all over the world. Mr. Goldstone has been managing properties at Grass Valley for a number of years and has contributed some valuable work to the State Mining Bureau. He secured this position, which carries a salary of $7500 a year and expenses, through Louis Janin of this city.

Recently Declared Mining Dividends.

Highland Mining Co., South Dakota, one of the Homestake corporations, $20,000, payable Feb. 20—a total to date of $3,244,918.

Florence Mining Co., Montana, $10,000; payable March 1.

Le Roi, Rossland, B. C., $25,000; payable March 1. This makes a total of $325,000 since October, '95.

Idaho, British Columbia, $20,000; payable Feb. 27.

Anchoria-Leland, $6000; payable Feb. 15th.

Arizona copper mine, $48,000; payable Feb. 15.

Two Friends mine, Slocan, B. C., 2½ per cent; payable March 31.

Penn M. Co., Grass Valley, Cal., 5 cents per share; payable March 10.

Cariboo M. Co., B. C., 2 cents per share, $16,000; payable March 3.

Ontario Mining Co., Utah, monthly dividend $15,000; payable March 2.

Daly, Utah, Mining Co., monthly dividend $37,500; payable March 2.

Morning Star gravel mine, Placer Co., Cal., No. 75, $5 per share; payable March 1.

A STEAM ORE STAMP.

One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL,** installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed. We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C McDONALD, Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to

STAMP MILL AND CONCENTRATOR IN OPERATION ON PREMISES.

Thomas Price & Son,
Assay Office, Sampling Works
And Chemical Laboratory.
524 Sacramento Street, San Francisco, Cal.

FRASER & CHALMERS,

Chicago, Illinois,

Have brought out a new line of medium size

Steam Hoisting Engines,

These are designed with great care by engineers familiar with the best previous practice, and knowing just what is wanted to render satisfactory service on a mine. Do you want such service? Then buy one of these improved machines.

Other Special Lines of Manufacture

On which we would be glad to quote are

Stamp Mills, Shoes,
Smelting Furnaces, Dies,
Cyanide Plant, Cams,
Ore Crushers, Rolls,
Frue Vanner Concentrators, Jigs,
Brown Roasting Furnaces,
Huntington Mills,
Perforated Metals and Screens,
Corliss Engines,
Adams Boilers,
Riedler Air Compressors & Pumps,
Otto Aerial Tramways.

Qualified by a Quarter Century of Experience to render you the best of service, we invite your inquiries and patronage.

FRASER & CHALMERS, CHICAGO, ILL.,
CITY OF MEXICO, DENVER COLO.
SALT LAKE CITY, UTAH; 80 BROADWAY, NEW YORK.

THE PELTON WATER WHEEL,

EMBRACING IN ITS VARIATIONS OF CONSTRUCTION AND APPLICATION

THE PELTON SYSTEM OF POWER.

In simplicity of construction, absence of wearing parts, high efficiency and facility of adaptation to varying conditions of service, the **PELTON** meets more fully all requirements than any other wheel on the market. Propositions given for the development of water powers based upon direct application, or

ELECTRIC TRANSMISSION

Under any head and any requirement as to capacity.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHAIN PROTECTOR AND DUST GUARD FOR BICYCLES.—Harry Jacoby, Oroville, Cal. No. 577,581. Dated Feb. 23, 1897. This invention consists in the construction and arrangement of a chain protector and dust guard, the object being to completely cover the sprocket wheels and chains of bicycles and other similarly driven vehicles, and protect the same from dust and other substances which would cause wear and interfere with their operation and at the same time to act as a guard to prevent the clothing of the rider from being caught in the gearing. It consists essentially of boxes or casings enclosing the terminal sprockets, one of said boxes having an open side and a removable cover threaded to screw into it, and the other having removable sector-shaped piece and a U-shaped slide for locking it in place. These boxes have hollow arms projecting toward each other, communicating with the boxes and forming passages within which the chain travels. The whole device is easily opened or detached for cleaning purposes whenever desired.

Established 1852. Incorporated 1895.

SEE WHAT ONE DOLLAR WILL DO

It will secure for you **immediate delivery** of a complete set of **eight superb volumes** (nearly **4,000** pages, magnificently illustrated) of the **latest, most practical** and in every way the **best general reference library in the English language**—the

STANDARD AMERICAN ENCYCLOPEDIA

You have a whole year to pay the balance in monthly amounts, so small you will not feel the outlay.

8 LARGE VOLUMES. Nearly 4,000 pages. Over 300 Colored Maps, Charts and Diagrams. Every Volume Mechanically Perfect.

The Only Encyclopedia Strictly "Up to Date."
SIZE OF VOLUME:
2 ins. Thick. 8½ ins. Wide. 11½ ins. Long.

A COMPLETE LIBRARY

For daily use in your home or office.

THE STANDARD AMERICAN is prepared by

JOHN CLARK RIDPATH, LL.D.

author of "Ridpath's Histories," etc., assisted by a large corps of editors and over 100 eminent scholars and specialists.

A SUPERB REFERENCE WORK

treating over 60,000 topics (10,000 more than any other encyclopedia), covering the entire field of human knowledge, thought and endeavor.

FRESH FROM THE PRESS

The NEW STANDARD AMERICAN ENCYCLOPEDIA is brought down to the present time, and contains hundreds of articles on subjects not treated in any other reference work. Another important feature in which it stands absolutely alone is its very full Appendixes, which embrace over 100 sub-divisions, including a **Biographical Dictionary, a Dictionary of Technical Terms, a Gazetteer of the United States, Statistics of Presidential Elections, State and Territorial Elections, Religious Summaries, Statistics of the Population of the World, and a Veritable Mine of Other Information on thousands of subjects of universal interest and importance, written in such simple language that even a child can readily understand.**

THREE GREAT AUTHORITIES SAY:

"There is no work in the world that can compare with it."—*New York Herald.*

"It stands ready to answer any question."—Bishop JOHN H. VINCENT, D.D., LL.D.

"The Standard American Encyclopedia is especially suited to private families. Its tables, maps of countries and cities, Summaries of Useful Knowledge, etc., make it a most valuable book of reference. I cordially commend it to the public."—EDWARD BROOKS, Superintendent of Schools, Philadelphia.

For a Limited Time Only—Just to introduce the work **ONE DOLLAR** secures **IMMEDIATE POSSESSION of the entire set of 8 volumes. Balance payable $1.50 monthly for one year.**

You thus at once secure this splendid set of books for continued use and enjoyment. It is the One Great, Practical Reference Library for the Professional and Business Man, the Teacher, the Student, the Farmer, Artisan, and Mechanic.

MAGNIFICENTLY ILLUSTRATED THROUGHOUT

With over 3,500 engravings, of superb quality and wonderful variety, including numerous engraved portraits of distinguished Poets, Authors, Physicians, Chemists, Philosophers, and Scientists, and with over 300 new maps and charts from the VERY LATEST EXPLORATIONS and SURVEYS, delineating Continents, Empires, Countries, States, Cities, Towns, Citadels, Solar, Lunar, and Planetary Systems, and every portion of the known world, and forming a Complete and Indexed Atlas of the globe. **THE STANDARD AMERICAN** is the **best illustrated** and the **best mapped Encyclopedia in the English Language.**

OUR GREAT INTRODUCTORY OFFER

To secure widespread and favorable publicity for **THE NEW STANDARD AMERICAN ENCYCLOPEDIA,** we have decided to place a few introductory sets in each community throughout the country for comparison with all other reference works as to plan, scope, lateness of treatment and general practical and educational value. We feel that every set will create a demand for others. While the distribution will be general in extent, it will last for a limited time only, after which our regular subscription sale will begin, at prices ranging from $48 to $72 a set, according to style of binding. Now, however, to quickly and thoroughly introduce the work, as above stated, we make the price merely nominal (about the cost of paper and printing), the distribution being **LIMITED TO A VERY FEW WEEKS,** reserving the privilege of withdrawing the offer at any time when we consider a sufficient number of these introductory sets, at the special price, have been distributed.

OUR GREAT SPECIAL OFFER.

SEND $1.00 to THE ENCYCLOPEDIA PUBLISHING CO., 156 Fifth Avenue, New York City, and a full set of **eight volumes of THE NEW STANDARD AMERICAN ENCYCLOPEDIA,** in cloth binding will be forwarded to you. The balance is payable at the rate of $1.50 monthly for one year, or about **5 cents a day.** If you prefer the half-Morocco binding, the monthly payment will be $2.00, and for full sheep, $2.50 per month for one year. **We recommend the half-Morocco style,** which is particularly elegant and serviceable, and will last a lifetime. **If not entirely satisfactory any set may be returned within ten days and money will be promptly refunded.** Owing to the nominal price at which these introductory sets are supplied, transportation charges must be paid by the purchaser; but our entire confidence that the volumes will be gladly received and cheerfully paid for is shown by sending a $48.00 set of books on an advance payment of only $1.00. We also feel that you will thoroughly appreciate this great work and speak favorably of it to others. Each set weighs boxed nearly 50 pounds, and will be shipped by freight unless otherwise ordered. We refer you to the publishers of this paper. Please mention it when writing.

Send two-cent stamp for postage on twenty-two page illustrated pamphlet with sample pages, colored map, and portraits of famous inventors. Address

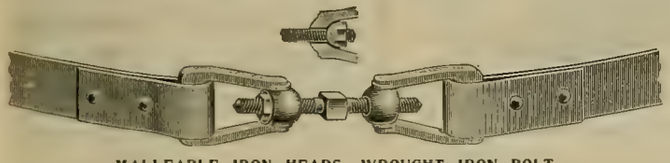
When Writing please mention the MINING AND SCIENTIFIC PRESS.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891 MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.



PATENTED, Aug 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

PATENT HOOP CLAMP.

ALL SIZES.

MALLEABLE IRON HEADS, WROUGHT IRON BOLT.

These couplings are the best. They are the most powerful. They have a direct pull with right and left screw. They work freely on ball and socket joints. They are easily applied. We use them extensively in our tank building department.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

Market Reports.

The Markets.

SAN FRANCISCO, March 4, 1897.

Jobbers report an increasing demand in all lines of goods. The buying seems to have taken on new life, for many merchants have discarded the hand-to-mouth way of buying and are purchasing in larger quantities. It may be that a larger consumption has compelled this course, for there has been quite an influx of persons into the gold mining districts, and also into the more favored agricultural sections of the State. Several iron manufacturers report more estimates on new work, particularly mining, structural and railroad, than at this time in 1896. So far the year opens to them under favoring auspices—raw material cheaper, crop prospects never better for a large yield, and a continued boom in the gold mining industry.

The local money market is working easier, with the premium for exchange on New York cut half in two. It is stated that it will soon be wiped out and exchange may sell below par before thirty days pass. This verifies the position taken by the MINING AND SCIENTIFIC PRESS. There is now money offered on the market with, in some instances, shaded rates of discount asked. There seems to be more inquiry for funds for investment propositions and also for other purposes, but borrowers, as a rule, want a lower rate of discount, which it now looks as if they will secure. The outward movements of California have fallen away, but they still aggregate in value nearly half a million a week.

Eastern money markets are reported fairly active, but at no advance in the rates of discount. It seems to be the prevailing opinion at the East, and also on this coast, that towards the close of the extra session of Congress, when the country will know what to expect in new legislation, business throughout the country will begin to show a marked revival. Our New York correspondent writes that "there is a noticeable hardening in the commercial paper market. The head of one of the large banks which does a good deal of business in paper tells us that in his opinion the rate for standard grades is likely to be full 4 per cent before long. The reason for this is that most of the banks and institutions which make a habit of buying paper have full lines on hand just now, and they are not inclined to extend themselves further in this direction at present. For call loans on gilt edge security the 'gentlemen's agreement' not to loan money at less than 2 per cent, which has been adhered to for some weeks by most of the leading banks in this city, has lately been departed from by two or three banks. One bank loaned over $1,000,000 at less than 2 per cent, and at least two others loaned considerable sums at the same rate."

New York Silver Prices.

NEW YORK, March 4.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 11-16	64⅝
Saturday	29 11-16	64⅝
Monday	29⅝	64½
Tuesday	29⅜	64⅜
Wednesday	29⅜	64
Thursday	29¾	64¾

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 32½	10 25@12 50	13 55
Saturday	12 00	3 35	10 25@12 50	13 55
Monday	12 00	3 35	10 25@12 50	13 55
Tuesday	12 00	3 35	10 25@12 50	13 55
Wednesday	12 00	3 35	10 25@12 50	13 50
Thursday	12 00	3 35	10 25@12 50	13 50

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Dratt	7½c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.86¾
London Merchants	$4.85
London Sight Bankers	$4.88¾
Refined Silver, per oz., 1000 fine	64⅜
Mexican Dollars	51⅛@52

SILVER.—The market hung around last week's closing, but on Monday it began to ease off in London and at New York. The decline is reported to be largely due to a selling pressure brought on by press telegrams that Japan would adopt the gold standard. The crop season in India is at hand, which has some influence on the market abroad. It is stated that the call on the London market has fallen off some, which the outward shipments from America have not decreased.

MEXICAN DOLLARS.—In sympathy with silver Mexicans have eased off, which has caused exporters to buy sparingly. The market closes dull.

COPPER.—The market has held to firm prices throughout the week. Eastern advices state that the market is strong at full figures, with a continued free export movement. The production in this country, it is said, is increasing, but so is the consumption at home and abroad. Notwithstanding the heavy movements to Europe, stocks there are decreasing.

The local market is quoted as follows:

Ingot, jobbing	14½@——
Ingot, wholesale	——@13½
Sheet copper	——@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

QUICKSILVER.—The market is strong at another advance. It is stated that the advancing markets here and abroad is due to a smaller output. Shipments to Mexico the past week aggregated 200 flasks. Our market is quoted at $38.75 for domestic consumption.

BORAX.—The market is steady at last week's changes.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5¼
Powdered, in car lots	5
Concentrated, "	4½

LEAD.—There is nothing new to report. The markets at the East and abroad are strong. There is an increased demand from corroders.

Our market is quoted in jobbing lots as follows:

Pig	3 75	@	3 85
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a strong tone to the market.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The market holds fairly firm for pig, but is irregular for plate.

We quote as follows:

Pig, per lb	14½c@—
Plate, I C coke, heavy, per box	$4 05@—
" " " light, "	3 95@—

IRON.—The market is shaded on our quotations. The demand is fair for the season.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The War Department is asking for bids on next fiscal year's requirements for this coast. The demand for steam, gas and house is light. The general market is unchanged.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Cuman	5 50@ 6 00
Seattle	5 50@ 6 00
Coos Bay	—@ 5 00
Cannel	8 00@— —
Egg, hard	12 00@13 00
Wallsend	—@ 6 50

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is fairly steady both here and at the East.

Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6½@6⅝c for Hallett's and 6½c for Japanese.

POWDER.—At present market values are nominally unchanged.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

NAILS.—The market appears to be shaping in favor of buyers.

Wire, carloads, basis per keg		
" jobbing, " "		$2 20
Cut, carloads, " "		
" jobbing, " "		2 00

SPELTER.—There is a continued fair movement at firm prices.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The markets here and at the East are practically unchanged.

PLATINUM.—The inquiry is said to be fair.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is steady at quotations.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—The East reports an improved movement.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is steady to firm.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

Jobbers report an improved demand, but this always obtains with the spring trade setting in. In quotations, outside of nitrate of soda, no changes are reported in either our market or at the East.

BONEASH.—The export and home demand is fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is reported quiet but firm at 2½c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but steady at $1.50 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—The East reports a continued active demand, with holders able to get a further advance. Chile reports strong markets.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is quiet at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is light. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—The Eastern markets are strong and active. Ours is firm but quiet.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, March 4, 1897.

The market this week sold lower under the lead of Con. Virginia. The decline is said to have been brought about by the free selling of Con. Virginia and Hale & Norcross by an outside operator. Whether the selling was for his or another person's account is a disputed point; but let that be as it may, the effect suited those who are trying to get prices down and keep them down, if possible, until outside holders are frozen out by assessments. So far as the present showing in Con. Virginia is concerned the price ruling for it is too high, but there are far too many who take chances in the hopes that a big body of good to high-grade ore may be developed. The writer will state now, as he did when the market was higher, that prices for shares are based on the quantity of ore in sight, a fair valuation of dead work and exploiting work, and a fair advance for the prospects of finding ore. On this basis Con. Virginia is not worth $1 a share and some of the other shares are also too high, while some, like Alpha, Bullion, and some of the Gold Hill shares, are too low. Three assessments were levied this week. The levying of them, with rumors of more to follow, has a depressing influence and encourages bears to sell the higher-priced shares. There is another thing that is against the market and that is, any movement to reform the management of the mines antagonizes the other interests. These interests combine to down the promoters of any move to create more honesty in mine management. This is witnessed in the combination to take Hale & Norcross from the present management and put it in control of those, so report says, whose management of the mine they control is far from satisfactory. This may be an inside move so as to destroy confidence to buy shares at as low prices as possible. It is to be hoped that the fears expressed by some as to the motives which actuate those who will get control of Hale & Norcross are groundless and that the mine will be managed on honest lines. This would make it an object lesson as to persons in control of the mines said to be wrongly managed.

The following companies report cash on hand March 1: Alpha Con., $1739; Alta, $468; Andes, $645; Best & Belcher, $4508; Bullion, $3139; Con. California & Virginia, $1788; Con. New York, $413; Crown Point, $2259; Challenge Con., $1398; Con. Imperial, $133; Exchequer, $2423; Gould & Curry, $7031; Justice, $109; Occidental Con., $204; Potosi, $3593; Savage, $7954; Sierra Nevada, $47; Union Con., $3564; Utah Con., $2921; Caledonia (Gold Hill), $2823; Confidence, $1158; Overman, $4431; Standard Con., $9566.

The following mining companies report an indebtedness March 1: Belcher, $4301; Chollar, $8000; Hale & Norcross, $196; Kentuck, $11; Lady Washington, $11; Mexican, $1000; Ophir, $2500, due bank, less $842 cash on hand; Seg. Belcher, $1000, due bank, less $294 cash on hand; Silver King, $1954.

The news from the Comstock mines is not of a character to enthuse shareholders. The general tenor of official letters filed at the different offices gives the impression that it is not ore the managements are after, but it is how to kill time, so as to pay out money and levy more assessments. Advices from Alta are practically unchanged. The letters (official) give the impression to mining men that the management is trying to see how long they can bleed shareholders before showing up ore. In Overman and Caledonia the work is on the same levels heretofore reported. They continue a success in not showing up, or, at least, none so far as the public is advised. The official letters from Seg. Belcher are as silent as an Egyptian mummy as to the reported ore found some time ago. The letters are also silent as to the levels on which work is being done. This gives the impression that more shares of these mines—Crown Point and Yellow Jacket—are wanted by the inside. The work in Crown Point is essentially unchanged. It looks as if it will be some time, probably not before more shares are secured, before ore is shown up. Nothing was heard of the past week about the ore reported taken out of the long west crossdrift that is being run by Confidence, Challenge and Con. Imperial. There is nothing new, so far as officially reported, from these mines. It looks to an outsider as if the Alpha management has its superintendent play a game of hide and seek with the west lode. It is stated that there is plenty of good to high grade ore to the west, which can be shown up when desired. From Bullion nothing of an exciting character is expected for several weeks yet, or until shares are better concentrated. From Potosi, Hale & Norcross, Savage, Gould & Curry and Best & Belcher nothing of an important nature has been allowed to leak out. No work is reported in Chollar. In Con. Virginia the work is continued on the 1000-foot, 1550-foot, 1650-foot and 1750-foot levels. From the way the market broke, it would seem as if the stringer of ore had been hid, to come into view when it is desired to make shorts fill. The reports from its different levels are

Mine well developed. Complete working plant. Situation and facilities first class. Address H. D. RANLETT, Ranlett, Amador County, Cal.

practically unchanged since our last week's review. It looks as if it is not advisable to find much ore at this stage of the game. In Ophir they continue to fool around the Central Tunnel and 1000-foot level, with nothing new reported. The official letter reports a strike on the 1000-foot level of Mexican, but it is 75 cents, not $75, a ton ore. The formation is the same as reported last week. In Union considerable work is being done, but to no purpose, outside of getting away with money for expenses. The letter from Sierra Nevada reports a small seepage of water from workings on the Layton tunnel level. A shareholder thinks it small in comparison to the seepage of money from his pocket. From Utah and Andes nothing of importance has come to hand.

From the Brunswick lode nothing new came to hand the past week. The letters on file are very largely a counterpart of those filed the preceding week. In Occidental they are working on the 550-foot, 750-foot and 850-foot levels. On the latter level bunches of ore have been found. In Chollar the work is confined to the south drift on the 500-foot level. The material is very hard. The work reported in official letters from Savage, Gould & Curry, Best & Belcher and Con. Virginia is about the same as in the letters filed for several weeks past.

The following illustrates the changes of the week:

MINES.	Feb. 25.	Mar. 4.

The MINING AND SCIENTIFIC PRESS of San Francisco, in its issue of February 20, devotes the front page to an illustrated account of the La Belle gold fields. This journal has the largest circulation of any mining journal in the United States, and the good that it has done the mining interests of New Mexico during the past three or four years is simply incalculable. It is seldom that an issue of this widely read paper appears without an extended account of some of our mines. As a matter of reciprocity, this journal deserves the support of the mining interests of the whole Territory. It follows closely the very latest inventions in mining machinery, contains reliable mining news from all parts of the world, and is simply indispensable alike to the working miner and the mining investor. —*Daily New Mexican, Santa Fe.*

For Sale at a Bargain.

One new GOLD KING AMALGAMATOR—never used. Apply to Marshutz & Cantrell, N. W. corner Main and Howard streets, San Francisco, California.

British Columbia.

W. J. R. COWELL, B.A., F.G.S., Mining Engineer,

Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Hale & Norcross Silver Mining Company will be held at the office of the Company, No. 421 Pine street, room 3, San Francisco, California, on WEDNESDAY, the 10th day of March, 1897, at the hour of 1 o'clock P. M. for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, March 6th, at the close of business hours.

R. U. COLLINS, Secretary.

Wanted:

Some quartz mining company who are just starting out in business, or a company who are dissatisfied with their superintendent, or some manager who is dissatisfied with his assistants, or any one in the mining business to give me a job. I have a job, but I want a better one. I WANT MORE WORK AND I WANT MORE PAY. I have run the whole works of a 60-stamp plant. I can make an assay, retort and melt bullion, build roads and bridges, keep books, run a store—in short, I can do what a mine manager should be able to do. I am 33 years old, am married, and will contract for two or more years with a responsible party anywhere on earth. Could begin shortly after a proper agreement was entered into. CAN FURNISH REFERENCES TO SATISFY THE MOST SCRUPULOUS. To avoid delays, address

JOHN P. SCHMIT,

1301 SANTEE ST.,

LOS ANGELES.....CALIFORNIA.

Assessment Notices.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 24th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 24th day of February, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on FRIDAY, the 26th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on FRIDAY, the 21st day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1) of five cents (5c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—210 Sansome street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

POSTPONEMENT.

At a meeting of the Board of Directors of the Mineral Hill Mining and Smelting Company, held on the 15th day of February, 1897, it was resolved that any stock upon which the assessment shall remain unpaid on the 15th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 13th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

CHAS. PEACH, Secretary.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 6) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the date of delinquency of the above assessment is postponed to the 10th day of March, 1897, and the day of sale to MONDAY, the 29th day of March, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 43) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of February, 1897, an assessment (No. 26) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of March, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 6th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARGUERITE GOLD MINING AND MILLING COMPANY. Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 5) levied on the 14th day of January, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name	No. Cert	No. Shares.	Amt
Julius Winkler	29	200	25 00
G. F. Deetken	82	1 000	100 00
Julius Winkler	95	400	50 00
Mrs. G. F. Deetken	100	600	60 00
Fred Deetken	255	1 000	100 00
Mrs. G. F. Deetken	256	800	80 00
Franz Schmitz	285	50	5 00
Franz Schmitz	286	50	5 00
Franz Schmitz	287	50	5 00
Franz Schmitz	288	50	5 00
Franz Schmitz	289	50	5 00
Franz Schmitz	290	50	5 00

And in accordance with law, and an order from the Board of Directors, made on the 11th day of January, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 237 Twelfth street, San Francisco, California, on THURSDAY, the 8th day of April, 1897, at the hour of 5:30 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

F. MeTTMANN, Secretary.

Office—237 Twelfth street, San Francisco, California.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work refractious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Pluta, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. HENDY-NORBOM CONCENTRATOR.

Office of WEBB GOLD MINING COMPANY,
G. McM. ROSS, SUPERINTENDENT,
BROWN'S VALLEY, CAL., Sept. 14, 1896.

Mr. John O. Norbom—DEAR SIR: I have been using your Concentrators at our mines in Brown's Valley and am pleased to inform you that they are in every respect thoroughly satisfactory. When erecting the plant at the above-named place we built Canvas plant, but since putting in your Concentrators we have but little use for that. The percentage of sulphurets now being handled is from 1¼ to 2 per cent, mostly galena and iron pyrites, and crushed fine. We save from the pulp over your machine 98⅛ per cent, and it hardly pays for the labor on the Canvas plant. The motion given your Vanner by its delicately constructed curved springs renders it a perfect machine, and in my estimation it is but a short time before it will replace all other machines of a like nature now in use.

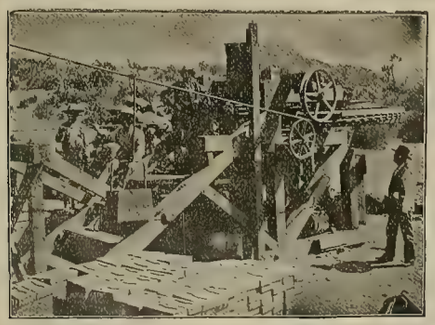
Yours very respectfully,
[Signed] F. W. PAGE,
General Manager Webb G. M. Co.

SAN FRANCISCO, CAL., Jan. 31, 1897.

Joshua Hendy Machine Works—GENTLEMEN: I have used two of your Hendy-Norbom Concentrators for two seasons in Alaska, and wish to say that in their operation they have given almost perfect satisfaction. They have handled ten tons each per day of ore carrying from 3 to 6 per cent of sulphurets, an average saving of 95 per cent.

With ores carrying 3 to 4 per cent sulphurets, they will easily handle ten tons each per day and save over 95 per cent; but with a more heavily sulphuretted ore the quantity given them to work should be less.

With the improvements you have made in this machine since ours were bought, I should say that your Concentrator was almost perfect in capacity and in saving and wearing qualities.



Yours truly,
[Signed] N. S. TROWBRIDGE,
Supt. Bald Eagle M. Co.

The Cochrane Special Feed Water Heaters and Receivers.

Herewith are presented several views of one of the devices which have been designed and placed on the market for heating the feed water, and for use in connection with any heating system using exhaust steam. The first view shows the external appearance of the Cochrane special heater and receiver, built by the Harrison Safety Boiler Works, Germantown Junction, Philadelphia. The second view shows the general construction and location of the oil separator, overflow opening and its protecting hood, steam trap, float and connections to waste pipe, etc. Figs. 3 and 4 show the general construction. These heaters are constructed to withstand, if necessary, a working pressure of fifteen pounds per square inch, which is five or six times as much as the back pressure ordinarily carried to insure circulation in a heating system.

FIG. 1.

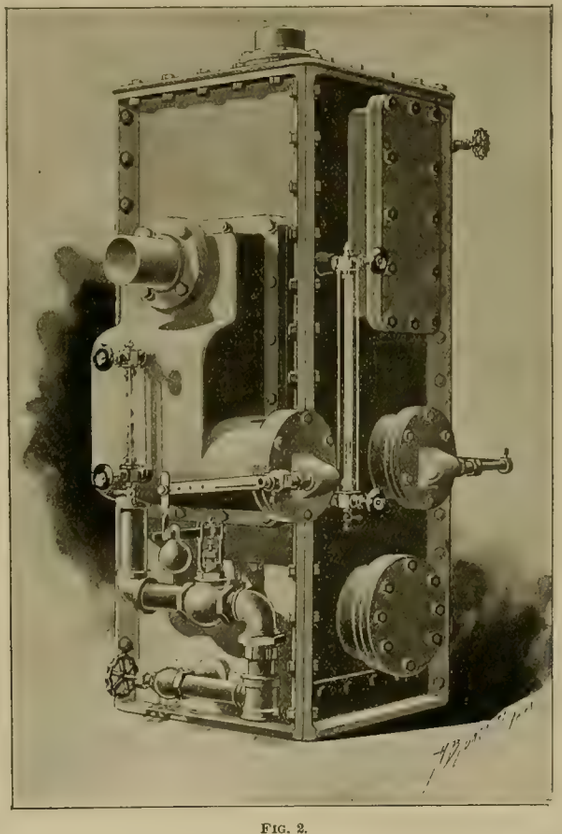

FIG. 2.

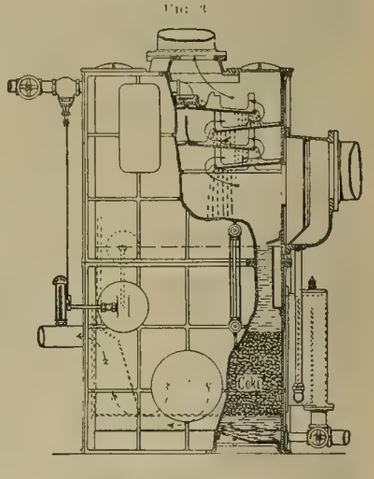

FIG. 3.

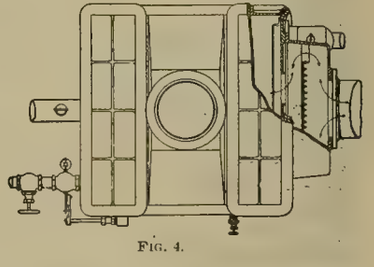

FIG. 4.

COCHRANE SPECIAL FEED WATER HEATERS AND RECEIVERS.

The system, in brief, is as follows: The different exhausts from pumps, engines, etc., are collected in one pipe and passed into the heater through the separator, which extracts all oil or grease. The boiler feed water is first taken care of, the cold water needed to supplement the return condensing the requisite amount of exhaust steam. The surplus exhaust then passes through the heating system and this, when condensed, is gathered and brought back into the heater in the firm of hot water; the exhaust being supplemented, when necessary, by live steam direct from the boiler through a reducing valve, which is so set that it will only admit steam when the pressure of the exhaust falls. The exhaust pipe to the atmosphere is provided with a back pressure valve set to any required pressure (usually less than three pounds), that the pressure may not exceed the desired amount.

The cold water is automatically regulated by a self-draining float, which, so long as the condensed steam furnishes the necessary water supply, allows no cold water to enter, thus obtaining the full benefit of all the heat in the exhaust, and using over and over again the comparatively pure water of condensation, which should furnish from 80 to 90 per cent of all the water used when the heating system is in operation. This means pure water for the boilers, less frequent cleaning, greater efficiency and greater longevity. In these heaters the cold water supply is brought in at the top and the quantity of this supply is controlled by a balanced valve operated by suitable connections to a ventilated copper float of long leverage. The temperature is given to the incoming water by breaking it up and thoroughly mingling it with the exhaust steam, which passes up between the trays and thence out of the top of the heater to the heating system. The exhaust steam in entering the heater first passes through the oil separator.

To prevent the egress of steam while providing an exit for the overflow, and for the oil and water taken out by the separator, a special steam trap, composed of another suitable long leverage ventilated copper float operating a balanced valve in the waste pipe, is provided. The illustration will explain the general detail of this arrangement.

The returns from the heating system are brought into a specially designed trough forming a water seal for the return pipe, thereby preventing steam from the heater from ascending into the heating system through the return pipe and interfering with the circulation, and at the same time providing for bringing this water of condensation into contact with exhaust steam in the heater, to insure for this water the same temperature as that of the water stored in the pool below. Another feature is the provision for both a working low water level and a high water line, in order that the heater may store up any sudden rush of the pure water of condensation returned from the system.

To provide additional depositing surface and filtering material, all of these heaters and receivers are furnished with perforated cast iron plates or shelving, on which filtering material, such as coke, hay, gravel, etc., can be used. Suitable doors for the introduction and removal of the filtering material are furnished, together with hand hole and tray cleaning doors, all conveniently placed and so arranged that easy access is offered to all parts of the heater.

The Parke & Lacy Co, 21 and 23 Fremont street, San Francisco, who are the coast agents for this heater and receiver, furnish a detailed list of twenty-two sales in October and November, '96. In one case—the Baltimore & Catonsville Construction Co.—sixteen competitors bid on an advertised contract for 6000 H. P. for use in the steam plants of the electric road running between Baltimore and Washington, and after thorough investigation the contract was given the "Cochrane."

Mud Roads to the Mines.

Since the publication of the last issue of this paper a number of communications have been received in reference to the wretched state of the roads in the mining counties along the Sierras. One correspondent writes that on the road from Ione to Sutter Creek, in Amador county, he saw eight freight wagons stuck in the mud and left to await better weather and an improvement in the condition of the roads. Besides that, there were four dead mules. Many people, in preference to driving over the roads or taking the stage, walk across the country, avoiding the highways. Many of the mines which ship out concentrates to the smelters are compelled to store them until spring. But little calculation would be required to show that the losses entailed to the owners of working mines, to those who are fitting up new properties, to the storekeepers and to the working miners who are thrown out of employment for the time, during this one season, is enough to more than pay for first-class highways.

Under the old laws there has been little excuse for bringing about such a condition, and it is questionable if much good will be done under the new Highways Act unless the people are more careful in the choice of officers. However, all interests are sufficiently awakened to the need of a change, and their influence should be felt.

Non-Residents and Mining Degrees.

At the last convention of the California Miners' Association C. McM. Ross made a suggestion that arrangements be made so that the University of California issue to non-resident students the degree of Mining Engineer, that the University announce the subjects in which students would be examined and suggest the best text-books for study, and in all possible ways aid the non-resident students to prepare for such examinations as would be required.

As to the first part of the suggestion made by Mr. Ross—that the University issue to non-residents the degree of Mining Engineer—there is no doubt that upon passing the proper examinations any non-resident would obtain such a degree. However, without better facilities than can now be obtained in the mining districts and without the aid and general direction of the faculty of the College of Mines, very few would be able to prepare themselves. For this reason the suggestion made by Mr. Ross is of value and should be acted upon, if a feasible plan can be devised. It is well known that a large proportion of the students in the College of Mines are miners who have gone to Berkeley to obtain better knowledge of the sciences upon which a thorough mining education is based. Much of the work, no doubt, they might do at the mines in certain districts with very little assistance from the University. However, to obtain the degree of Bachelor of Science or Mining Engineer they would all doubtless have to spend some time in the laboratories at Berkeley.

Mine Robberies.

As to this evil, the act of March 20, 1872, provides that anyone stealing from any mining claim, tunnel, sluice, undercurrent, riffle box or sulphuret machine any gold dust, amalgam, quicksilver or concentrates shall be deemed guilty of grand larceny. This has long been found inadequate, and the Legislature has passed a bill introduced by Assemblyman Powers of Placer amending the act so as to read as follows, the words in italics being new: Every person who shall feloniously steal, take, conceal, remove or carry away from any *mine or* mining claim, tunnel, sluice, undercurrent, riffle box, sulphuret machine, *quartz mill, arrastra mill, chlorination or reduction works*, any gold dust, *or nuggets, or specimen rock*, amalgam, quicksilver, or concentrates, *or zinc sponge, or the ore or mineral from any mine, ledge, lode, vein or deposit, or other valuable mineral products* the property of another, shall be deemed guilty of grand larceny, and upon conviction thereof shall be punished by imprisonment in the State prison for any term not less than one year or more than fourteen years.

A number of leading members of the California Miners' Association a few months ago asked that steps be taken to induce the Legislature to pass an act to provide that all people who bought ore, sulphurets or bullion should keep a book, in which should be recorded the names of those from whom they purchased, the mine from which it was secured and other such data as would identify it, and to provide, further, that any one making affidavit that ore or bullion had been stolen from him should have a right to inspect such books. Such a law is in force in Colorado and works well. In this State those who steal from the mines can with little difficulty dispose of bullion to storekeepers or saloonkeepers in the neighborhood with little fear of detection from that source. Mine owners often complain that from those who purchase they seldom find any records of the purchase. Yet they say that in most of the cases where such stolen property is traced, it is through the larger concerns who do keep records. However, no steps were taken to have such a bill introduced by those most interested.

Mining Corporations' Power to Purchase Property.

Assembly bill No. 454, an act to amend the act of April 23, 1880, for the further protection of stockholders in mining companies, has passed the Legislature and been signed by the Governor. Such a bill was recommended by the last convention of the California Miners' Association. It is as follows:

It shall not be lawful for the directors of any mining corporation to sell, lease, mortgage, or otherwise dispose of the whole or any part of the mining ground owned or held by such corporation, nor to purchase or obtain in any way (except by location) any additional mining ground, unless such act be ratified by the holders of at least a majority stock of such corporation then outstanding. Such ratification may be made either in writing, signed and acknowledged by such stockholders, or by resolution, duly passed at any regularly called stockholders' meeting. The certificate of the secretary of any mining corporation reciting such ratification at a stockholders' meeting, or the names of stockholders with the amount of stock held by each, and the total stock outstanding signed and acknowledged by him in the manner provided for acknowledgments to conveyances of real property, may be attached to or indorsed upon any deed, mortgage, conveyance, or other instrument made under this act and recorded with such deed, conveyance or other instrument, and the recitals contained in such certificate, or the duly recorded copy thereof, are made prima facie evidence of their truthfulness for all purposes whatsoever; *provided*, that no one except a stockholder in any such corporation shall be permitted to urge any objection to the acquisition of any additional ground or other property by such corporation.

For the Prospectors' Protection.

A mining lawyer commenting on the pending mining legislation at Olympia, Wash., according to a paper published in that State, brings up the following unique arguments against a meritorious bill:

The bill before the Legislature providing for ten feet of work to be done on a mining claim before a mineral discovery can be established may be wise legislation, but it will not fill the bill. When a prospector makes or locates a discovery, he is very apt to know whether or not it is worth his while to sink on the property. One thing certain, it is his by right of discovery under the United States statutes, and the State has no business interfering with him to the end of making his privilege an expensive luxury. Prospecting is a trade within itself, and involves the element of discovery only, while mining is quite another occupation, and it is hardly the proper thing for the State to force the prospector to work or the miner to prospect.

The average genuine prospector will probably object to this description of him, even where he is given credit for knowing whether a mine will pay to sink on or not simply by looking at it. Of course, most prospectors know that many a good claim has been spoiled by sinking on it, and some of them know when to stop sinking for fear of injuring their prospects. However, the real prospector knows very well that to be compelled to sink ten feet or run a tunnel that distance before completing a location can work him little harm, and in a way is a protection to him. One of the greatest evils the prospector or any one locating a mine has to contend with is from those harpies who, upon the discovery of a promising claim, make locations all about with the idea that these may become of value through the work of the first locator or for the purpose of levying blackmail by cutting off rights of way. Not being compelled to do any work, they simply hold their claims, and, if necessary, when the time for doing the required assessment work has passed, relocate. Often these worthies work in pairs or in groups, and at the time for relocation jump each other's claims. Such a bill can work no hardship upon the man who honestly locates a mine.

Had all locators been compelled to comply with the spirit of the laws as they now stand, many more mines would have been developed. The object of them is to encourage the mining industry and not to hamper it. It is claimed that the passage of the proposed bill would be in conflict with the United States statutes, but such is not the case. Similar laws have been tried in other States and not overthrown by the courts.

Reports of Mining Corporations.

Last week mention was made of the passage by the Legislature of California of a bill to amend the act of March 30, 1874, for the better protection of stockholders in mining corporations. It would appear that the passage of this bill in the shape it was signed by the Governor is more far reaching than was indicated by the copy sent to the MINING AND SCIENTIFIC PRESS. The bill as originally introduced by the Committee on Mines and Mining in the Assembly was made to refer to all mining corporations. But before its final passage there were added to the first section, which provides for the making of monthly reports by superintendents and keeping of accounts for the inspection of stockholders, the following words: "Provided that this section shall apply only to mining corporations whose stock is listed and offered for sale at public exchange, and shall not apply to mining corporations whose stock is not listed in the public exchange, and is not offered for public sale."

If the act stands, its effect will be that the superintendents of mining companies shall no longer be required to make weekly or monthly statements, nor the secretaries compelled to keep their accounts open to inspection of shareholders, excepting, of course, companies listed on exchanges. This is as desired by and in accordance with a resolution of the California Miners' Association passed at its last convention, in which the repeal of the act of March 30, 1874, was urged.

However, the bill would seem to have been loosely drawn. It has been suggested to us that the words quoted above will be construed as making the bill special legislation and unconstitutional.

Concentrates.

AN experimental plant for testing ores is being erected for Charles Butters in Salt Lake City.

A NEW YORK syndicate has purchased the California mine in the Slocan district, British Columbia, for $60,000.

RIGHTS of way are being obtained for the proposed railroad from Oakdale, Stanislaus county, to Sonora, Tuolumne county.

THE Provincial Legislature of British Columbia has passed a bill that will enable Rossland, Nelson and Grand Forks to incorporate.

THE Young America, adjoining the Dexter mine, at Tuscarora, Nevada, has been bonded to A. B. Andrews of Salt Lake for $20,000.

THE Mercur mine in Utah has ordered a rock crusher with a capacity of 1000 tons daily, and will begin the enlargement of the mill.

THE owners of the Centennial-Eureka mine at Tintic, Utah, contemplate erecting a mill, to work low-grade ores, with a capacity of 200 tons a day.

TO DATE 294 applications for permits to work hydraulic mines have been made to the California Debris Commission; of which 231 have been granted.

THE Mount Morgan Gold Mining Company of Queensland crushed, in 1896, 104,265 tons of ore, from which the gold returned amounted to 151,137 ounces.

TESTS are being made in Butte, Montana, of a smokeless powder, which it is claimed will not explode from concussion, and when ignited makes no smoke or fumes.

AN amendment to the mining laws of British Columbia, to provide that no Chinese shall be employed in quartz mines, is being advocated in the Provincial Legislature.

THE Mitchell's Creek Freehold Gold Estate of New South Wales crushed last year 11,240 tons of ore, from which there was obtained in gold £264,504, an average of over $110 per ton.

THE first hoisting engine in the Rand district, in Kern county, California, has just been erected on the King Solomon mine, on which it is the intention of the owners to sink 500 feet.

THERE is considerable stir over some new placer discoveries in Tule canyon, Esmeralda county, Nevada, where placer claims are being staked off on ground covered by 4 or 5 feet of snow.

THE railroad from Nampa to the Owyhee mines in Idaho, which is being built by local capital, has been completed to the Snake river, where a bridge is to be built at an expense of $70,000.

ACCORDING to a Mariposa county paper Capt. A. H. Ward has disposed of his Pinon Blanco mining property to a company of Colorado mining men known as the Iron Mountain Mining Company of Colorado.

THERE is an eager seeking after British Columbia mines on the part of English capitalists. Offers have been made for the War Eagle, lately purchased by a Montreal syndicate, for the Le Roi and for the Jumbo.

THE Jackson Exploration Company in January in 29¼ days sunk the main shaft in the Amador Queen No. 1, in Amador county, California, 77½ feet, making a total to that date of 472 feet. Ten men were employed.

THE Alice mine in Pinacate district, Riverside county, Cal., has been bonded to Los Angeles people for one year. A cyanide plant of about twenty-five tons daily capacity will be put up and the ores treated by that process.

A CONTRACT has been let for building 102 miles of railway from Weiser to Seven Devils, Idaho. It is expected to begin work this month. The building of this road is caused by the need for transportation of ore from the mines.

THE Revelstoke, British Columbia, Board of Trade has recommended the appointment of a Government inspector in each district to report upon the condition of each mine, so as to afford investors an opportunity to obtain actual facts.

DR. WILLIS E. EVERETTE, the mining editor of the Washington *Investor*, states that he and associates have been authorized by a syndicate of foreign and New York capitalists to offer $5,000,000 for the Le Roi mine at Rossland, B. C.

AT Los Angeles the price of oil is steadily going up, sales having been made at as high a price as $1.50 at the wells. The City Council has taken up the question of regulating the work of production, to abate nuisances within the city limits.

WHAT is claimed to be a valuable discovery of coal has been made near White Horse district, Washoe county, Nevada. The layer found at a depth of 32 feet below the surface is said to show a body 4 feet thick of coal of excellent quality.

THE manager of the Harquahala mine in Arizona reports for January: 3663 tons of tailings—Bullion yielded, $7054; royalty on lessees' ore and miscellaneous, $3150; total, $10,204. Milling and cyaniding expenses, $5366; profit for month, $4838.

IN order to better handle the output, the Everett & Monte Cristo Railroad Company in Washington has decided to build a branch extending from the main line at Granite Falls some thirty miles into the Sultan and Silverton mining districts.

A BILL has been introduced in the Legislature of New Mexico to prevent mine owners from compelling their employes to purchase their supplies from the mine stores—a custom that is very general in that Territory among the larger companies.

UP to Feb. 28 there were shipped from the Kootenay mines this year 9547⅛ tons of ore of an average value of $77.10, or a total value of $736,096. Besides this, matte from the smelters valued at $661,079 was shipped. This gives a total for the two months of $1,397,175.

THE railroads in the Kootenay country in British Columbia are increasing their rolling stock to meet the demands on them, and the hotels are overcrowded. The newspapers warn all except miners or men with money to stay away, as there is no employment for others.

ARRANGEMENTS are being made for the erection of a 200-ton matte smelter at Canon City, Colorado, by a company represented by ex-Governor Foster of Ohio and other parties. The plant is intended to reduce the Cripple Creek ores from 20 to 25 tons to 1, and sell the matte to the refineries.

IN Montana the Mineral Land Commissioners have in the Bozeman district classified 1,656,134 acres of railroad lands out of the total of 2,313,164 acres. The cost to the Government will not exceed 7 mills per acre. Only four protests have been filed against the classifications as made.

AT the Le Roi mine, British Columbia, a test was made of ten tons of ore that assayed $10 per ton, or what is is called in that camp low grade, and it showed that $7.50 per ton was free and could be saved on the plates. This, it is understood, will lead to the erection of stamp mills on the ground.

THE London and Cripple Creek Reduction Corporation is the name of the company which has about completed reduction works at Florence, Col. The new plant, the manager states, will have a capacity for treating 200 tons of ore per day by the Page leaching process, designed to work low-grade refactory ores.

THE Union Pacific Railroad Co.'s coal mine No. 1 at Rock Springs, Wyoming, has produced, since it was opened in 1869, over 5,000,000 tons of coal. To bring coal to the surface the company operates a 2000-horse power engine having two reels, each of which carries a steel rope 1¼ inches in diameter and over a mile long.

COLONEL C. F. CROCKER, of the Southern Pacific Company, states that they have made surveys and have everything in readiness to begin building a road from Mojave to Randsburg, California, but are awaiting until satisfied that the developments of the camp will warrant this. A road could be built in a few weeks.

MANY records for fast sinking of shafts are being published of late. At the Amador Queen mine in Amador county, Cal., lately 85 feet were sunk in thirty days. At the W. Y. O. D. mine at Nevada City, Cal., a shaft 6x10 was sunk last month 150 feet in thirty days through solid blasting in granite, diorite and diabase.

THERE has been organized a Mining Bureau by people of Denver, Colorado, which will keep exhibits of ores from all districts and reports of mines and districts, which may be consulted. In addition, on Saturday afternoons meetings are held, at which addresses are made by authorities on different subjects connected with mining.

SEVERAL good records have of late been made in California in shaft sinking, but none so far equal some of those of the Comstock. In 1878 the Osbinton shaft was sunk from the surface 2000 feet in five months—an average of nearly 14 feet per day. The dimensions were 30x8. The Forman shaft was sunk 2000 feet at the rate of 15 feet per day.

IN proportion to the amount of money spent and lives lost in Rhodesia and the stir it has made in the world during the past year or two, the gold output of the mines has been ridiculously small. According to the *Rhodesian Times*, published at Salisbury, the total number of tons mined since 1890 is only about 10,000 and the gold obtained 7047 ounces.

IN Cripple Creek more low-grade ores are being treated this year than ever before. The building of new reduction plants has brought down the cost, and lower grades are being treated than has heretofore been possible. Much of the ore of this class is being held as an investment, the owners believing that treatment costs will be still further reduced.

DURING the week ending February 27 twenty-four cars loaded with silver and lead bullion were hauled out of Salt Lake City, Utah, by the Union Pacific, the weight reaching 834,049 pounds. In addition to this there were three cars of copper bullion, weighing 142,539 pounds, and fifty-one cars of gold, silver and lead ore, weighing 1,997,200 pounds.

AT La Brilladora mine, at La Brilladora, Mexico, owned by New York people since 1892, the hoisting plant consists of natives, each with a rawhide bag and a notched pole. They strap the bags to their heads and carry out from 200 to 300 pounds each trip. One man will make twenty-five trips each day to a depth of 200 feet. His wage is 37½ cents per day.

THE Utah Legislature has before it a mining bill providing that locators shall put monuments at each corner of a claim, and that within ninety days from the date of the location notice annual assessment work to the value of $100 must be done. It will not be many years, it is to be hoped, before California will fall into line and pass laws containing these reasonable provisions.

THE Horn Silver mine, Utah, in 1896 put through the mill 26,684 tons and marketed 5534 tons. The yield was $213,543. The cost of extracting the ore was $4.51 per ton, the cost of concentration, including labor and supplies, $1.52, each ton of concentrates representing a cost of $7.63. The average value of the concentrates was $26.88, while the average value of the shipping ore was $12.93 per ton.

THE *Mining Investor* of Colorado Springs, which is a conservative and yet a bright paper, says that it believes $10,000,000 would be a conservative estimate of the output of Cripple Creek for 1897 and would not be at all surprised to see it foot up $12,000,000. It may be, it says, that litigation will interfere, but nothing outside of this can interfere with the increasing prosperity of the camp.

STATE SENATOR NEBEKER of Utah is advocating the passage of a law to regulate the number of claims a single individual may locate. He says that two partners confessed to having located no less than 458 claims in the Camp Flag district. Today the annual assessment work on them would call for an annual outlay of $45,800. Over 100 claims have been located in the interest of one person in the West Dip at Mercur and another controls 163.

WORD comes from Tintic, Utah, that in the Sioux-Ajax tunnel the mineral-bearing zone has been reached. The ultimate destination of the big tunnel is a point at which connection will be made with the ore bodies of the Sioux mine, in which thousands of tons of ore have been blocked out. It was to provide an economical outlet for these bodies that the tunnel was incepted, but in tapping these it became necessary to cut through ground that must share the benefit.

THERE is hard feeling between the "sooners" and the government officials on the borders of the Colville reservation in Washington. Along the Columbia river, from Hunter to Daisy, there are said to be from 300 to 500 men waiting for the signal which will open the reservation to the prospector. The seekers for locations declare that when the north half of the reservation was opened last year the government officials held the civilians at bay and took up the best ground.

AT the time of the great fire in the Utica mine at Angels, Cal., all the rats in the mine were killed or driven out. Lately the superintendent ordered of his hardware merchant in San Francisco a gross of rats to be sent up. This has been done and the rats turned loose in the mine, where they are said to serve as a protection to the miners. In case of fire, water or gases the movements of the rats warn the miners of the approach of danger. They also prove useful in clearing up the refuse of the mines.

A MOVEMENT is on foot in London among certain shareholders in mining companies to form an association for the purpose of protecting their interests. One of the promoters says: "The discovery of gold in Western Australia and the cheapening of the mode of extraction of the precious metal have led to the formation of an enormous number of mining companies. It is notorious that many of these companies are not managed in the interest of the shareholders at all, but solely with a view to put money into the pockets of the directors and their friends."

THE San Francisco Copper Company, operating copper mines in Lower California, has disposed of its holdings to a London and Paris financial combination for a consideration of $500,000, and the stock is soon to be placed on the Paris bourse. The mine is an old producer and the output up to the present time is claimed to be in excess of $1,000,000. It was formerly worked by the Mexicans in the crude fashion of the miners of that country, and for several years past has been operated by an American company.

LAST week the cash in the New York clearing house banks was a little over $200,000,000, an amount that has not been exceeded since 1894. Of this sum $60,000,000 is seeking investment. There is likely to be more. The gold mines of the United States produced over $50,000,000 in 1896, and probably not much less than $100,000,000 was paid to American owners of mines in purchasing properties by foreigners. It is probable that much more will come in this year, and much of this money will seek investments other than mining.

THE Wyoming Legislature has passed an act by which fees for filing incorporation articles are regulated by the amount of capital stock. There is a similar law in Montana, which is easily evaded. In other States it has been proposed to adopt like measures. Luxuries, especially harmful luxuries, have long been considered fit objects for high taxation. If any one wants to incorporate a 10-foot shaft with a 2-foot vein for $1,000,000, he should pay for the use of the facilities given by the State. An act on this subject might be entitled "An act to levy a tax on deception."

THE coming "boom" in mining in London promises to be as to British Columbia properties. Africa and Australia cannot be conjured with, and the most available field seems to be British Columbia. More of the money that is seeking legitimate investment will come to the United States than ever before, but probably, happily, without any "boom." British Columbia is a splendid field for investment, and those papers which care most for the welfare of the Province are doing all they can to prevent overcapitalization of mines and to keep up the good reputation of the properties and people of the Kootenay country.

THE day after the closing down of the De Lamar mine in Lincoln Co., Nevada, March 1st, on account of the formation of a miners' union and the belief on the part of Captain De-Lamar that a strike would ensue, a meeting of the old employes was held at which resolutions were adopted by the employes of the De Lamar Company stating that they were satisfied with the treatment and wages they had been receiving, and had not contemplated a strike and were duly appreciative of the situation. The Salt Lake *Tribune* states that this does away with all misunderstandings and that the company will soon resume work.

THE Carson *Appeal* makes an attack on Assembly bill No. 74, introduced in the Nevada Legislature, providing for an extra tax on the product of the mines, saying that it is a scheme on the part of some script dealers in San Francisco to realize a profit out of the bonds of Lincoln county. In 1873 Lincoln county issued bonds to the extent of $180,000, bearing 10 per cent interest per annum. The interest and principal now amount to $600,000. In 1895 no interest had been paid on the part of the principal. For ten years prior to 1895 the commissioners of Lincoln county failed to levy any tax to meet the payment of these bonds, and the holders sued the county in the U. S. Court and obtained judgment for $600,000. This bill, if passed, would impose most of the burden on the De Lamar mine if it should start up again.

THE miners of the Rand district, in Kern county, California, are evidently not satisfied with the laws being passed by the Legislature, for the amended laws and regulations adopted last week provided for a definite marking of the boundaries of all claims. The proposed bill, which is now in the hands of the Governor, leaves this point in as unsatisfactory a shape as it has been. The section of the Rand regulations on this subject is as follows: "Section 4. The area of a mining claim in the Rand mining district shall be as now by the United States mining laws provided, not to exceed 1500 feet in length, with 300 feet on each side of the vein or lode, and such surface boundaries shall be marked by five monuments, one at each corner, with an initial monument at the point of discovery, each monument to be not less than 2½ feet high, with a notice placed thereon, showing the designated corner of the claim, with relation to the same."

REGARDING the foreign market Messrs. Pierre Humbert Jr. & Co. say: "The talk of another large foreign investment of capital in our copper mines may or may not be true at present, but it is certain that over three years ago letters were received from a very prominent London banking house, desiring to know if Calumet & Hecla and Boston & Montana could be acquired for that market. Since that time the Anaconda mine has been placed there, and has whetted the appetite of foreigners for our copper mines. It would not be astonishing if a London absorption of shares from the Boston market itself would not soon develop. The demand for good gold mining properties increases, and there is considerable activity in the placement of new properties. Another $2,000,000 syndicate is being organized to operate in mother lode gold properties. The tendency of the Boston market is distinctly toward mining properties of copper and gold."

THE annual report of the Quincy, Mich., Mining Company for 1896 shows a production for the year of 16,863,477 pounds of refined copper, as compared with 16,304,721 pounds produced in 1895, an increase of 568,756 pounds. The gross sum realized for the copper was $1,842,117.19, and from sales of silver $22,080.42. This is equivalent to 10.92 cents per pound for the copper alone, or, taking copper and silver together, 11.05 cents per pound on the output. Expenses at mine, smelting, transportation and all other expenses amounted to $1,108,569.14, making the cost of copper 6.57 cents per pound. Mining and other profits from all sources were $770,063.64. Dividends paid by the company in 1896 amounted to $1,000,000. Two of the Quincy's shafts are now down a depth of over 4000 feet and another 3920 feet. Since the organization of the company the Quincy mine has produced a total of 199,388,521 pounds of refined copper at a profit of $9,597,564.32, from which fifty-six dividends, amounting to a total of $8,670,000, have been paid. The shares of the company are to be doubled shortly, making them 100,000.

The Precipitation of Gold by Zinc Thread from Dilute and Foul Cyanide Solutions.*

By ALFRED JAMES, Glasgow, Scotland.

Some months since, in the Johannesburg gold fields of South Africa, the attention of the author was directed to certain statements to the effect that the gold contents of foul or extremely dilute cyanide solutions could not be effectively precipitated in practice by the usual zinc method.

Such statements caused all the greater surprise because it is well known that this difficulty is not encountered in other well-known districts, as, for example, in New Zealand, where solutions containing less than 0.05 per cent of CKy are regularly reduced in practice to below 1 grain of gold per ton, while in Mexico and the United States almost equally satisfactory precipitations are not uncommon.

As a result of these representations, however, the author visited several plants at work in the Transvaal, and noted that while at some few mines the precipitation was really excellent, at other the effluent, after treatment, was much too high in bullion contents.

An investigation into the causes of these unsatisfactory results disclosed the fact that more attention to the close packing of the zinc shavings in the extractor compartments tended to improve the results, even with the most dilute solutions. The function of the zinc being one of surface, it stands to reason that a compartment well filled with zinc would be more effective than a half-filled one. Moreover, the quality of the zinc was inferior. This should be in long, tough, thin, light threads, light enough to ignite readily, and tough enough not to disintegrate easily into a slime. The coarse shavings too frequently employed appear to give the reverse of the best practice; they are brittle, contain less surface, and take up more room. It is almost impossible to pack a compartment properly with such zinc, which permits the existence of channels through which the solution may ascend without coming into effective contact with the zinc at all.

The boxes which do the best work have compartments the depth of which is greater than any other dimension.

But even under the best conditions solutions are encountered which give trouble when run through in the ordinary way. Such solutions are those charged with alumina salts, and those resulting from the treatment of weathered concentrates containing acid iron salts.

Very thorough investigation has been carried out on these solutions; and it is found that by simply giving them longer contact with the zinc they may be treated with complete success. With solutions the alkalinity of which has been neutralized by acid salts, it is advisable to add a slight amount of soda; but even in the most difficult case an alkalinity of 0.025 per cent, or ½ pound per ton, has been found perfectly effective.

Moreover, with extremely dilute cyanide solutions, that is, solutions containing under 0.05 per cent of free cyanide, perfectly satisfactory precipitation may be carried out by passing the solution through the extractors at the rate of 1 ton of solution per twenty-four hours for each cubic foot of zinc thread employed. But even when the solutions are very foul, with iron and alumina salts in solution, and containing *no free cyanide*, one is able in practice to reduce the bullion contents to *1 or 2 grains per ton* by passing the solution through the extractors at the rate of about ½ ton of solution per cubic foot per diem, the solution being in contact with the zinc for one and one-half to two hours.

This small amount of extractor space, even with the most difficult solutions, as compared with that required for electric precipitation, deserves to be noted.

Liquors derived from the treatment of cupriferous ores and concentrates, and containing 0.2 per cent of copper in solution, were found to be quite amenable to a treatment similar to that which sufficed for the foul liquors from weathered concentrates.

The following are notes of experiments carried out in connection with the investigation above referred to.

The solution examined was one that was returned in a cyanide works as containing 44 grains of gold per ton, after it had been *twice* passed through the extractors in the usual manner. An investigation showed that it contained a considerable quantity of arsenic and nearly 1 per cent of soluble sulphates in solution, resulting from the treatment of some exceedingly acid weathered concentrates.

The solution was run through the extractors with the following modifications:

(*a*) The solution was run through a third time at the rate of 2 tons per cubic foot of zinc per diem.
Assay before treatment, 2 dwts. 12 grs. per ton.
Assay after treatment, 1 dwt. 18 grs. per ton.

(*b*) There were added 4 lbs. of ammonium chloride per ton of solution, and it was run through at 2 tons per cubic foot per diem.
Assay before treatment, 2 dwts. 12 grs. per ton.
Assay after treatment, 1 dwt. 17 grs. per ton.

The addition of the above amount of ammonium chloride had thus no beneficial effect at the above rate of extraction.

(*c*) There were added per ton of solution 4 lbs. of burnt lime, slaked and made into a cream, and the precipitate was allowed to settle. The rate of flow was not accurately determined, owing to the precipitate having reduced the rate of flow in pipe.
Assay before treatment, 2 dwts. 12 grs.
Assay after treatment, 14 grs.

(*d*) Solution (*a*) was run through again, for a *fourth* time, at 2 tons per cubic foot per diem.
Assay before treatment, 1 dwt. 18 grs.
Assay after treatment, 5 grs.

(*e*) The solution was run through again at especially slow rate of ⅓ ton per cubic foot per diem.
Assay before treatment, 1 dwt. 11 grs.
Assay after treatment, 2 grs.

This shows a great improvement, and indicates that slow running is, of itself, more practically efficacious and cheaper than the addition of chemicals to assist precipitation.

It was found, however, that after the run had been continued for some hours the assay of the effluent rose to 12 and then to 20 grains per ton. An examination of the zinc showed that it had been coated with a white incrustation which consisted mainly of ferrocyanide of zinc.

In all the above experiments there was only a trace of free cyanide or of alkali present in solution; and the formation of the incrustation pointed to the necessity of alkali or free cyanide in solution to prevent any such reaction.

(*f*) Some of the same solution as that used for the previous experiment was now run through the extractor at the rate of about ⅛ ton per cubic foot of zinc per diem, after sufficient cyanide had been added to the solution to make it show 0.08 per cent of free KCy.
Assay before treatment, 0 dwt. 19 grs. gold per ton.
Assay after treatment, 0 dwt. 2 grs. gold per ton.
KCy before treatment, 0.08 per cent.
KCy after treatment, 0.023 per cent.

This experiment shows that the addition of free cyanide causes a satisfactory precipitation. There was no incrustation formed on the zinc. The consumption of cyanide, however, amounted to 1 pound per ton; and to avoid this, if possible, the investigation was continued, and

(*g*) A similar experiment was carried out at the same rate of flow, but adding 4 lbs. of slaked lime per ton of solution instead of cyanide, the precipitated sludge being allowed to settle.
Assay before treatment, 0 dwt. 19 grs.
Assay after treatment, 5 grs.
KCy before treatment, *nil.*
KCy after treatment, *nil.*

The zinc was washed free from incrustation in dilute solution of caustic soda prior to the commencement of this experiment, and sufficient new zinc was added to replace the consumption of previous runs. At the conclusion of the experiment there was a slight incrustation on the zinc in the first compartment only.

(*h*) Experiment as above, but with 4 lbs. of caustic soda per ton added in place of lime. No fresh zinc was added, nor was the zinc washed.
Assay of solution before treatment, 0 dwt. 19 grs.
Assay of solution after treatment, 0 dwt. 1 gr.

After the run the zinc was very black, and there was no incrustation.

(*i*) Experiment as above, but with less soda, and the rate of flow increased to ½ ton per cubic foot per diem.
Assay of solution before treatment, 0 dwt. 19 grs.
Assay of solution after treatment, 0 dwt. 3 grs.

(*k*) In this experiment the run was continued for some days at ½ ton per cubic foot per diem, and samples were taken every twelve hours. There was no caustic soda added, there being present only 1-5 lb. per ton of solution; gold was added to make the solution up to 2 dwts. per ton.
The solution assayed before treatment, 2 dwts, 0 gr.
The solution assayed after treatment, 0 dwt. 2 grs. to 0 dwt. 5 grs.

The above experiments show the perfect practicability of precipitation from troublesome solutions by keeping the rate of flow at ⅓ to ½ ton per cubic foot per diem, with the presence of from 0.01 to 0.15 per cent of caustic soda.

A further test was made on the precipitation of auriferous solution carrying quantities of copper, with the following results:

(*l*) Used solution from the sumps, containing 0.2 per cent of copper in solution; was run through extractors at the rate of ⅛ ton per cubic foot zinc space per day. Half a pound of caustic soda was added per ton of solution.
Gold in solution before treatment, 2 dwts. 0 gr.
Gold in solution after treatment, 0 dwt. 0.8 gr.
Copper in solution before treatment, 0.12 per cent.
Copper in solution after treatment, 0.097 per cent.

The zinc was coated with metallic copper, but the precipitation at above rate of flow was practically perfect.

Two more prolonged trials were then undertaken, in which a large quantity of solution was run over the zinc used in *l*, without any addition of fresh zinc, for over a week, to note the effect of the metallic copper coating on the zinc. It was found that the coating became disintegrated in the upper compartment, and that the precipitation continued unimpaired, though, as the quantity of zinc in the extractors was gradually lessened, the effluent solutions rose in value proportionately. On replacing, however, with fresh zinc the zinc consumed, the solution again became practically gold free, as in *l*.

In connection with the above precipitation experiments, two other points call for especial remark:

1. The amount of alkali added is kept as low as possible, to avoid any great excess beyond the amount required to neutralize the acidity of the ore and for zinc box reactions.

2. It is well known that the presence of alkali or alkaline carbonates, always present in used solutions, interferes with the silver nitrate test, making the solution appear to be stronger in available cyanide than is really the case. Chemists in charge of works should, therefore, be careful not to be misled by this test, or lowered extractions may result. The effect of caustic potash or soda on double cyanide of zinc and potassium is *not* to regenerate all the cyanide of potassium as shown by silver test, the test, as suggested by C. J. Ellis, being rendered unreliable by the silver throwing out the zinc from the double cyanide, and the zinc so displaced being displaced by the KHO present, thus prolonging the titration.

$$K_2Zny_4 + 2AgNO_3 + 4KHO = 2KAgCy_2 + K_2ZnO_2 + 2KNO_3 + 2H_2O.$$

*Trans. Am. Ins. M. E., Chicago meeting, February, 1897.

New Zealand Gravel Dredgers.

Dredging, like everything else connected with mining, offers room for numerous improvements. The evolution of the dredge itself from the mere rawhide scoop, worked by hand, to the great steam bucket dredge, which lifts its hundred tons of wash per hour, shows what advances have been made in capacity, but other improvements have been made almost more important than increased capacity. Increased length of ladder now allows the buckets to bring up stuff from a depth of 50 feet, and I suppose this is by no means the limit of deep working. The tailings elevator is another important feature, for it overcomes a difficulty which threatened the very life of deep working. It will be easily seen that a dredge excavating to a depth of even 30 feet or 40 feet in the gravels of a river bed must make a very big hole. In the loose shingle the sides would naturally fall in until what is known as a sufficient batter was made, and frequently the hole excavated was larger than the whole length of the dredge. This meant until recently that the enormous amount of tailings sent over the stern of the dredge simply tumbled again into the hole excavated, and had to be dredged over again. The tailings elevator prevents this, for it carries the tailings far beyond the stern of the dredge, and, if necessary, can stack them to a height of 30 feet.

The separating cylinder is still another improvement. Not long ago all the wash lifted by the dredge was simply shot onto the tables—big stones, little stones—a constant stream of tons in which were a few tiny atoms of gold. Fifty or sixty tons of heavy boulders, sand, etc., were hourly shot onto the tables, causing great waste of labor, great waste of gold; for the body of water required to sweep this stuff away again carried much of the fine gold with it. Now all the wash, as it comes up in the buckets, is shot into a perforated iron cylinder, which, slowly revolving, sifts out the sand and fine stuff which contains the gold, and sends all the heavy stones direct onto the tailings elevator, which carries them clean away.

These improvements in the actual working parts of the dredge have practically made the dredge master of the ordinary difficulties met with, but there is almost as much need for improvements in gold-saving apparatus now as there ever was. It has been pointed out again and again that the small size of gravitation tables and the vibration caused by the working of the dredge are accountable for the loss of a large percentage of gold. I see no reason why gravitation tables should be limited in size to the space not occupied by machinery on the main deck of the dredge. It would be quite easy to have the gravitation tables forming the roof, as it were, of the lower deck, and extending even over a larger area than the size of the pontoons. The fine, concentrated wash, as it comes from the cylinder, could easily be elevated to the tables, and so distributed as to be spread evenly over a surface five times as large as is used now, and if this is not sufficient, or if the vibration is still a drawback, why not have the gravitation tables extended over separate pontoons not affected by the vibration. In this way very light pontoons could carry a very large area of tables, and, if this were not sufficient, then send the concentrated wash ashore and treat it there.—New Zealand Mining Standard.

IN business, as well as in society, a great deal depends upon who introduces you. In advertising, the same thing is true. Take two journals going to the same people. Your advertisement in the one having the most prestige will do you more good than it will in the other. The prestige, the character or the indefinable something about an old, established, high-class medium lends itself to your advertisement in that medium. It adds value to your goods. But every time you place your advertisement in a medium of doubtful or cheap standing, this quality also lends itself to your advertisement. Be as careful about the character of the medium you use as you are of the company you keep. Do not use a medium because it is cheap. It may be dear at any price. You cannot afford to lend your prestige to a poor journal.—Advertising Experience, Chicago.

Outline of the Geology of California with Reference to Its Mineral Deposits.

NUMBER V.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS, Ph. D

Although the great deeps of the ocean basin have probably always been submerged, yet areas continental in size have oscillated up and down, one portion sinking while another rose to maintain an equilibrium. Instead of the Sierra Nevadas being the ancient range of California, we now think that the region of the coast mountains was elevated above the sea in most remote geological times. Following the period of gold deposition the Coast ranges began sinking again beneath the sea, which continued for an indefinitely long period except for a time, when they were temporarily re-elevated by the upwelling of great bodies of eruptive rock which is now known as serpentine. This is a peculiar rock, containing less silica than any other known rock, but carrying, in minutely disseminated quantities, the mineral known as chrome iron. As this mineral occurred originally in the rocks, it was of course without value; but Nature has taken another step and concentrated it for us. The serpentine has been fissured, and through these fissures percolating waters have passed, though under just what physical and chemical conditions we do not know. These dissolved out the chrome iron and deposited it in bunches of different sizes in the serpentine.

The Pick and Shovel mine near San Luis Obispo has been worked more than any other in California, and the deposits there are illustrative of the occurrence of chrome iron generally. When one bunch is worked out there is very little to guide the miner in finding another. Sometimes, however, a seam followed from one end of an ore body will lead to another, but it is very uncertain work. Bunches are known of more than a thousand tons weight. The areas of serpentine, and consequently those in which chrome iron may be looked for, extend in the Coast ranges from Santa Barbara county into Oregon and from Mariposa county north along the western slope of the Sierras. As a mineralogical curiosity I might mention an occurrence of chrome iron south of Shingle Springs, El Dorado county, in slate some distance from serpentine.

In some parts of California the proper conditions were present for the formation of coal beds during the Upper Cretaceous. This was notably the case in Shasta county. The beds dip beneath the lava and have been much eroded.

At the close of the Cretaceous the geography of California was again changed by an uplift in the Coast ranges. After a period of erosion sinking was inaugurated during the following period, to which we give the name of Eocene or Tejon. Again conditions for coal occurred as illustrated by the beds near Mt. Diablo, Corral Hollow and other localities in the Coast ranges. Owing to the disturbed condition of the strata, the search for coal is a puzzling and often disappointing one.

At the close of the Eocene the strata of the Coast ranges were again folded together, uplifted from the sea and subjected to erosion. Then followed a long period of subsidance through the Miocene. We have come now to the time when the greater portion of the oil-bearing strata were formed as well as quite extensive beds of coal. Wherever we find coal we know that the region must have been low and swampy on the borders of inland lakes or protected ocean lagoons. The Miocene coal is so young that its quality is poor, but it is mined from Elsinore on the south through the Coast ranges nearly to Oregon. Much of the coal in the latter State is also quite recent in formation. It is also mined at several places in the San Joaquin valley. It is dark and often brightly lustered when first mined, but soon crumbles. The intense mountain-making disturbances since the formation of these beds have so folded, faulted and eroded them that great care is necessary in determining the value of any outcrop. Only a skilled geologist can do it, and even he is liable to be mistaken unless thoroughly familiar with the local geologic conditions. Some of the best appearing beds are mere remnants left by erosion.

The conditions governing the occurrence of the oil beds are wholly different from those of the coal, and the two products are nowhere associated together. Our studies have shown clearly that the oil found at so many points through the Coast ranges has been derived almost wholly from the decay of sea animals. While the oil is now encountered in porous sandstone, it was not formed there but in the associated limestones. These are sometimes clayey and sometimes silicious, but have been formed largely of the remains of immense numbers of microscopic animals, together with fish which were sporadically entombed in the sediments. Exceptional conditions existed over the area of the Coast ranges during the latter part of the Miocene, for the quiet sea seems to have been fairly alive with minute calcareous and silicious organisms, the organic portion of whose remains go to make up the dark green oil. Several thousand feet of these sediments were formed, consolidated and finally lifted above the sea. With pressure and some accompanying heat, produced in the folding of the strata, the organic matter was distilled out and passed in many cases into the loose sandstone overlying the oil shales and limestones.

The oil-bearing rocks were termed by Prof. Whitney the Bituminous Slate series. They can often be recognized by the fetid odor on fresh surfaces as well as by their general light color and thin, even layers. They extend from Los Angeles through the Coast ranges to a point a little north of San Francisco. Though much of the region has not been carefully examined, yet the possible productive area is large. There is good evidence that the oil rocks underlie the whole of the Santa Barbara channel, but it is a question whether they can ever be tapped.

The remnant of the oil left from distillation and found over such a large section of country is known as asphaltum when found in veins and bunches more or less pure, and as bituminous rock when impregnating a loose sandstone. In the country south of San Luis Obispo great hills are found consisting of sandstone, and more of less completely impregnated with bituminous matter. The asphaltum residue represents of course an enormous quantity of oil, the volatile portions of which much have been distilled off under heat, and it is a question which yet remains to be settled whether oil can still be obtained in quantity near the great bodies of bituminous rock. At many localities in Santa Barbara county there are chimneys of baked rock in the vicinity of bituminous deposits, and the question of the relation between these is an interesting one. Intelligent study of the various geological questions connected with the occurrence of oil and asphaltum would be of great value.

A very marked disturbance took place in the Coast ranges at the close of the deposition of the oil-bearing rocks (Miocene), elevating the country again to form a prominent mountain range so that the erosive agencies began to work actively upon the exposed strata. During the Pliocene, the next geological period, sinking again commenced so as to permit the formation of strata of that age at many points along the coast, particularly at the mouths of the old rivers.

At some time during the Pliocene disturbances again arose which culminated in the outburst of volcanic rocks in the region between Clear lake and San Francisco, and to a less extent farther south, in the region of the Santa Barbara islands. These eruptions continued at intervals into the Quaternary. In northern California they were much greater in extent, building up from beneath the sea the volcanic ridge extending from Lassen's butte northward to Mount Shasta, and forming the thousands of square miles of elevated plains in northeastern part of the State, in Oregon, Washington and Idaho.

(To be Continued.)

California Diamonds.

The New York correspondent of the London *Mining Journal* believes that the prospects for diamond mining in the United States, and especially in California, are good. In a recent letter he says:

"It is not, I think, generally understood that the United States is likely enough, sooner or later, to become a diamond producing country. Records of unquestionable trustworthiness exist of diamonds having been found in Virginia and North Carolina, but the most productive State hitherto has been California. The first announcement of Californian diamonds was in 1850, in *Silliman's Journal*, and since then many genuine discoveries have from time to time been reported. The chief localities have been near Cherokee in Butte county, near Placerville in El Dorado county, French Corral in Nevada county and several places in Amador county. In Trinity county also some very minute diamond crystals have been found. Prof. F. Woehler of Gottingen some years ago examined samples of the "platinum sands" of Trinity river. After removing gold, platinum, chromic iron, silica, ruthenium, etc., by the usual methods, he observed the residue microscopically and found numerous colorless, transparent grains, which he presumed to be diamonds. Subsequent combustion in oxygen and precipitation from bayta water convinced him that the microscopic crystals were true diamonds. Having regard, therefore, to the wide area of the district over which the discoveries have been made, and to the fact that the whole of this district is of a distinctly volcanic character, and even yet is covered here and there with huge masses of lava and indurated volcanic mud, it can hardly be doubted that systematic prospecting will lead to the development of productive diamond fields. Analogous conditions, with variations of local detail, are observable in Arizona. I have myself seen on the mesa lands near Pinal many spots that I pointed out to the local prospectors as highly probable to prove diamondiferous; and on the occasion of a visit of inspection that I made in 1894 to the Upper Rancheria district of Amador county, California, I met several of the men who had found some of the more noted Californian diamonds, and was shown the exact places of the discoveries. The finds all happened in washing gold from the gravel that underlies the volcanic cap, and it is a moot question whether the gems were, properly, constituents of the lower or upper formation. But that they were merely specimens of far greater numbers cannot be doubted; and any adventurous spirit who may be willing to risk a little capital on the chance of discovering a large fortune might easily do worse than to engage in diamond hunting at Upper Rancheria. An attempt was made to interest the great DeBeers Company in the matter. It was thought that, of all men, the famous Sissy Raids (as we irreverent Yankees now call your irresolute empire builder) would appreciate the importance of protecting the diamond market. But this idea proved erroneous. So the Californian communication was probably used for curl papers, and its senders received no reply."

Drift Mining Costs.

In the Mayflower, a representative drift mine in Placer county, on the Forest Hill divide, F. Chappellet gives the following figures and data as to the cost of mining and milling the gravel, which will be of value to others engaged in similar work:

COST FOR MINING AND MILLING PER CAR—CAPACITY 1 TON—IN MAYFLOWER GRAVEL MINING CO., FOREST HILL, CAL.

Mining.	
Labor, etc	$1 00
Timber, etc	04
Transportation	05
Powder, candles, etc	10
Total	$1 19
Milling by Steam.	
Labor, wood, etc	21
Wear and tear on mill	01
Total	$ 22
Extra expense, blacksmith, etc	02
When using compressor for ventilation	01

When running the mill by water the cost is 9 cents per car less than the above estimate.

It will be observed that Mr. Chappellet states that, using water power instead of steam for running the mill, the cost of milling per car of the gravel would be but 13 cents.

The Mayflower mine has been worked some twenty years and may be taken as a good type of a drift mine with cemented gravel which costs more not only to work, but also for milling, than non-cemented gravel, the difference being, under similar circumstances otherwise, generally about 20 to 35 cents per car.

It will be interesting to those who worked similar gravels fifteen years ago to compare the figures of those days with the present. The cost of No. 2 powder then was from 25 to 28 cents a pound, and it is now being supplied for 8 cents a pound. Other supplies have fallen in price and new and cheaper methods of mining and milling have been introduced so that the cost of working such gravel as that of the Mayflower has fallen from about $3 per car to from $1.30 to $1.50.

This mine contains three distinct channels, the main Mayflower running north and south, the Orono crossing the Mayflower at a right angle crossing from the east and an upper channel following the same course as the Mayflower, but seventy-five feet higher. The Mayflower is now working two of these channels and opening the upper one. The gold on each channel is of different character and fineness. On the channels two and one-half miles of drifting has been done since the mine was opened.

Although the cost of timber and wood on the Forest Hill divide is comparatively low, it makes a great difference in the cost of any work where power is used whether steam or water power is in use. For example, in the Eureka Consolidated, Mr. Chappellet states that a tunnel 1900 feet in length, 6x6, which they have run with machine drills costs $9.50 per foot, using steam, while had it been possible to use water power the cost would not have exceeded $8 or $8.50 per foot.

J. B. Hobson, now operating in Cariboo, in a report stated that the cemented gravels there could be milled for 20 cents a carload and that twenty stamps could crush 200 tons per day, and was taken to task by the *Canadian Mining Review*. In reply, Mr. Hobson sent some data which that paper questioned. These figures from the Mayflower bear out the truth of Mr. Hobson's claim as to cost. The following is some of the data given by Mr. Hobson:

COLUMBUS WATERHOUSE'S MILL, IOWA HILL.

Number of stamps	10
Weight of stamps	1150 lbs.
Drop of stamps	6 to 8 inches
Drop of stamps per minute	95
Size of screens, round holes	⅜ inch
Water used in battery	8 miners' inches
Duty of 10 stamps for 24 hours	80 tons
Cost of mining and milling per ton	$1.85

MORNING STAR MINE, IOWA HILL.

Number of stamps	10
Number of men employed in mine and mill	70
Cost of timber for 12 months	$3050
Cost of general supplies, powder, etc., for 12 months	$6056
No. of carloads of cemented gravel milled in 12 mos	35,000
Cost of mining and milling per carload	$1.45
Dividends declared for 12 months	$121,200
Average yield of cemented gravel per ton	$4.90
Cost of mining per carload of one ton	$1.33
Cost of milling per carload of one ton	12 cents
Weight of stamps	850 lbs.
Size of screens, round holes	3-16 inch
Drop of stamps	6 to 8 inches
Drop of stamps per minute	95 to 100
Power used, Dodd's sigmoidal 36-inch water wheel, operated with 15 miners' inches of water delivered under a head of 470 feet.	
Duty of the 10 stamps per 24 hours	120 tons
Water used in battery	8 miners' inches

Mining Summary.

CALIFORNIA.

Amador.

Record: At the Potrazuba mine some rich ore has been encountered in the north drift, which is now in 80 feet; the drift south has been driven 150 feet, and an upraise is now being made to the surface. Some 700 tons of ore has been extracted, and, as soon as the weather will permit, the management expect to have another milling test made.

The work of laying 3200 feet of pipe at the Balliol mine is expected to be completed so as to start up the 40-stamp mill next week.

Ledger: Superintendent Bibo of the Union Consolidated, in consultation with the directors of the company, reached the conclusion that the proper manner in which to operate the property was to discontinue drifting and crosscutting, and sink; so on last pay day about one-half the men were discharged, and the balance continued at work sinking the shaft, which will probably be put down 1500 feet.

Butte.

At the Magalia mine, owned by Rideout & Haggin, and consisting of 1100 acres of gravel, the new shaft is 512 feet deep. The pumping is all done by compressed air, reheated below by steam. Originally the whole volume of water was raised to the surface, but Superintendent Gassaway now pumps it to the 300-foot level, where it is discharged through the old works into the creek beyond. A steam hoist at the bottom of the shaft hoists the gravel from the face of the gangway to the shaft, at present a distance of 1100 feet.

Enterprise: E. C. Paxton, from the Magalia ridge, says that every mine on the ridge is being operated and that there are fully 500 men employed in the mines along the ridge and on Butte creek.

Mercury: At Cherokee the bedrock of the ground hitherto worked in the Spring Valley is being sluiced off by hydraulic process and good returns are being made. The claim is owned by the Spring Valley Company and leased by P. L. Vincent, a local merchant. He employs forty-two men, and has permission from the Debris Commissioners to work, having built a dam ten miles down the river.

Calaveras.

Chronicle: Ex-Congressman J. A. Louttit has bonded from Mrs. J. Vandel her mine on the west slope of French hill, and a contract has already been let to L. Vandel to a sink a shaft to the depth of 50 feet on the lead.

In the Infernal gravel mine the gravel taken out is very rich. Considerable trouble is now experienced with water, and in order to obviate this difficulty a drain tunnel is now being run. The tunnel will be 250 feet in length.

Active operations have been resumed at the Green Meadow hydraulic mine, near Glencoe, by W. Clark. The claim comprises sixteen acres. The bank averages 10 feet and the water is obtained from the Clark ditch under a good pressure.

The body of water that flooded the El Encino mine a few weeks ago has finally been drained off to the drain tunnel level. The drain tunnel has been driven towards the old works for the distance of 150 feet, and it will be continued until the old works are tapped.

Prospect: The old gravel channel at San Antone camp, which in early days yielded great riches, is again being opened by Peirano and Lee. Water was the great drawback in early days, when the bed of the San Antone was worked and the channel made famous by its yields. It is now the supposition that the gravel deposits run directly under the old Cuneo store and thence under the mountains.

Seven men began labor upon the mines in Collierville district during the past week under the superintendency of J. Heard.

Inyo

Register: Best & Smith, owners of the Molus mine, have during the winter taken out enough ore to run their arrastra the coming summer. The shaft is down 80 feet and drifts 35 and 30 feet long have been run in two directions.

A deed was signed in Bishop last week conveying title to the Wild Rose mine from Harry McNamara and Pat Dowd to W. S. Couch and G. P. Doyle. The purchase price is $10,000. The mine, eight miles from Benton, has been idle for years. The work formerly done was limited, comprising a 100-foot tunnel and 130-foot shaft, but in this over $300,000 was taken out. Later Joseph McDermott sunk a 60 foot shaft, finding only base ore. The Banner mill, three miles distant, will be placed in shape to work the ore. This mill has not been used for thirteen years. A concentrating plant will be used at once, and if cyaniding experiments give satisfactory results a cyanide plant will be added.

Nevada.

Tidings: The work of putting in the new crown wheel to the North Star pump was finished last week, and the pump is once more at work after a stoppage of about four weeks. Although many miners and tributers have been forced to cease work by the flooding of the mine, the water has not crept up as fast as was expected. It is now slightly above the 1800-foot level. It was thought the 1200 level would be submerged.

Transcript: A French Corral Alex Dahlberg in his claim has run a tunnel about 50 feet from the South Yuba river, and has run in on the vein 200 feet. The ledge is from 20 inches to 3 feet in width and some of the quartz shows free gold. That in which gold cannot be seen prospects well in gold and sulphurets.

Placer.

Colfax *Sentinel*: The old Mountain Gate mine at Damascus is being slowly opened up. There are five men engaged in retimbering the old gangways.

Some weeks ago an upraise was made in the Cedar Creek tunnel. Gravel in abundance was found. Supt. A. Rodger is now preparing to prospect the channel.

The owners of the Tadpole gravel mine, near Secret House, have organized a company to work the property. The following Board of Directors have been chosen: J. L. Sparhawk, M. Poor, J. S. Sparhawk, J. Q. Ackerman and W. H. Cass. J. L. Sparhawk is manager and W. H. Cass is secretary and treasurer. The mine comprises 160 acres of land traversed by the same channel as that in the Whiskey Hill and Macedon claims, of which Secret Ravine is supposed to be the outlet.

The main tunnel at the works of the Blue Canyon Mining and Developmont Company is now in 330 feet. The rock is getting more favorable each day.

Thos. Wolford and D. P. Kidd will resume the work of developing the American Hill gravel mine in about two weeks.

Herald: The Bald Mountain mine above Last Chance has its shaft down 75 feet, and expects to reach bedrock in 40 feet more. A tunnel 1800 feet in length which had been run some years ago, and which came in too high for connection, will now be made to connect with the present shaft and the water and dirt taken out through the tunnel.

The Glen mine continues to pay well, and the company is opening ground as fast as possible to enable them to work a large crew to an advantage.

The Sailor Gravel Mining Company is working steadily with a full crew opening up ground, and all gravel passed through shows up well.

The La Trinidad quartz mine at Sailor canyon has a small crew during this winter taking care of the machinery and making developments. This company started to build a fine mill last fall, but the winter set in before they could complete the plant.

The Hancock Gravel Mining Company at Canada Hill have their tunnel in 600 feet, and are now raising to tap the channel, expecting to break through and begin gangways, crosscuts, etc., and to block out ground.

At New York canyon the Avilon mine has developed a fine body of blue gravel in 300 feet which is proving rich, and they are opening it up, employing additional men as fast as there can be room made for them.

The Herman mine is employing a crew of twenty men and the mill is running steadily, the ore showing up fully as good the past month as ever in the history of the mine.

Plumas.

Independent: The Debris Commissioners granted a permit last week to John B. Sutton & Ben L. Jones, to mine by hydraulic process at Jackson creek, near Cromberg.

George Brandt has been at the Centennial mine making needed repairs, building a new wheel and putting things in order for an early start.

Shasta.

Searchlight: Capt. Roberts, in his mine on Harrison gulch, has run three tunnels on the ledge. No. 1 is about 250 feet, while Nos. 2 and 3 are in about 300 feet, running on high-grade ore all the way. Besides these three tunnels, two crosscuts will further develop the ledge to a depth of 500 feet.

Immediately adjoining Capt. Roberts' claims is the Lucky Baldwin Extension, owned by Fowler & Hurst. The property has been developed by two tunnels, the lower giving a depth of about 180 feet; these are being connected with an upraise. From the lower tunnel a drift is being run on the ledge which has been uncovered for about one-third of the length of the claim, showing good ore all the way.

Reports of strikes are numerous, and confidence in the future of the camp is expressed on all sides.

At the National Consolidated Mining Company's property on Rich gulch arrangements are on foot to operate the machinery of the mine by electrical power furnished from the Paul & Garlick plant at Copley.

The litigation involving the ownership of the Shasta County Gold Mining and Development Company group of mines is about cleared away. Fifteen or twenty men will be put to work removing ore which will be shipped to Keswick to be used as a flux.

A working test is being made at the Keswick smelter on fifteen tons of ore taken from the Murray & Hull property above Shasta. If the ore comes up to requirements a contract will be entered into to purchase a large quantity of the ore, to be delivered at the smelter.

Free Press: Robert E. Hanley has closed down the Niagara mill after a successful run made on ore taken out in sinking 15 feet deeper in the shaft on the ledge, the lowest level in the mine, and where the ledge is 5 feet in width and shows high-grade ore. Owing to the flow of water they were compelled to cease operations. The property never looked better, and a steam pumping plant and hoisting works will probably be put in immediately.

A prospecting smelter, with a capacity of ten tons every twenty-four hours, is being erected on Clear creek under the supervision of E. Markwick. The object of the smelter is to demonstrate the successful smelting of the ores from the South Fork and Mule Mountain mines.

Work upon the John P. Jones mine near Igo is progressing rapidly. The contract for the construction of 200 feet of tunnel is completed, making a total of 400 feet, and a contract for 200 feet more will probably be let immediately. At the conclusion of this work it is expected to tap the ledge.

It is stated upon good authority that A. C. Hamilton of Virginia City will shortly begin the work of reopening the Potosi quartz mine near Muletown, the property of his brother-in-law, Senator John P. Jones.

Last week on the Princess Hydraulic Mining Company's property on Clear creek the water was turned into the long ditch which was constructed from Boulder creek to the mine, a distance of eleven miles. One giant was set to work and on Wednesday the second giant was placed in operation.

Sierra.

Enterprise: The owners of the Tippecanoe hydraulic mine, on Oregon creek between Pike City and Camptonville, have been granted a permit by the Debris Commissioners.

Siskiyou.

Journal: The day and night shifts at the Blue Gravel mine on Greenhorn are now down about 40 feet, and will soon be on bedrock, making about 6 feet to the shift. In another week the derrick will be in position, and an extra lot of men will be set at work within a couple of weeks, as Hunter & Smith intend to put on all the hands possible.

The miners at work on a small scale are not doing much lately, owing to the great amount of water in the ground from the recent heavy rainstorms, but will soon be able to start up again.

The river miners who expected to get out timbers and lay in supplies of lumber for early wingdamming have received a setback also from the late rains, which made the streams high and the roads too rough for doing much.

News: Golden & Eveleth have struck another rich pay chute in the 400-foot level of the Brown Bear mine.

The Oregonian on Salmon may be worked the coming season. It belongs to Hunter, Wallace and others, and is north of Sawyers Bar.

The Campbell property in Quartz valley will soon commence another run under the management of William Hobart, who has the property leased. The largest cut and discharge flume in this part of the country is on this property, it being 1500 feet long and 35 feet deep.

The Mabel mine, owned by Chamberlain and Timmins, will soon begin work. Mr. Chamberlain expects to resume work on the two south tunnels.

Tuolumne.

Union-Democrat: In the Soulsby drifts are being run from the 200 level, and stoping is being done on the south 200. The vein is from 18 inches to 2 feet in width and the ore gives flattering results. An air compressor is being put in and soon two Burleigh drills will be operated in the mine. Ten stamps are in operation and thirty men employed in the mine.

On the Golden Rule operations at present are confined to drifting north and south on the two veins from the 500 level and rock of a first-class grade is being taken out.

At the Black Oak ore is being extracted from the 900, where a large and rich body has been uncovered. There is a 14-foot vein, and the lowest grade ore goes high. It is estimated that 30,000 tons of ore are awaiting treatment. A 10-stamp mill is on the premises and preparations are now being made for ten additional. Forty-five men do the work at present, and this number will be increased before long.

At the App work is principally confined to drifting and stoping in the 200, 300 and 800 levels, and rock of high grade is being taken out.

At the Dutch work continues on the 200 and 300 levels, the two veins carrying 35 feet of quartz, although still carrying the footwall along on No. 3. The new blower and other machinery is being put in position, and soon the Dutch will be driven down to the 1000, 500 feet deeper than at present.

On the Alabama a depth of 220 feet has been reached in the double compartment shaft. Superintendent Nevills expects to let a contract on Monday for sinking 100 feet farther, but in the meantime sinking by day's pay continues as usual. Work so far is altogether on the east mother vein, showing 8 feet of quartz.

The Genevieve will soon have a prospecting mill, and about twenty men on the payroll. Garber & Bishop are the owners.

The Clark mine, on the east lode, will be driven deeper as soon as the water can be pumped from the shaft. The owners are Drescher & Lefevre.

Judge W. N. Harris of Jamestown will open the Junietta in early summer.

The Leap Year gravel mine in Table mountain, which has been worked off and on for a great many years, resumed operations again this week under the management of its owners, Hoskins, Lark and Hoskins.

W. N. Harris, owner of the Mazeppa, will extensively operate his mine and place a mill on the property as soon as spring opens. The Mazeppa joins the Jumper on the south.

Negotiations are under way for the opening up of the Strike-Young America mine.

Independent: The Dead Horse at Summersville is taking out some very good ore on the 1400 level.

At the Rappahannock the main shaft is being sunk by a contract and is now down 580 feet.

OREGON.

The Victory Placer Mining Company of Oregon has incorporated at Roseburg; capital stock, $5,000,000; W. H. Taylor, J. M. Stevenson, C. A. Sehlbrede. The property they propose working adjoins the Nash, or Victory mine, near Glendale, Or.

Jacksonville *Times*: More than a dozen giants are now playing in Canyon creek district, not far from Kerbyville, within a radius of six miles.

Beekman & Huffer have several men at work at their quartz mine near Jacksonville, who are engaged in stoping. They will immediately commence the construction of a 180-foot tunnel to tap the ledge.

Applegate Bros. are doing considerable development work on the La Rose ledge in Kane's creek district. They have opened the mine at different points for a distance of 400 feet, and everywhere find it showing good ore.

Medford *Monitor-Miner*: The Cameron placer mine on Applegate comprising a large amount of ground has been sold to San Francisco parties for about $50,000. A $25,000 hydraulic plant will be put in and the property will be operated on a large plan.

Baker City *Democrat*: The Virginia Consolidated shaft is now down 400 feet and will be run 100 feet deeper. Then crosscutting to the Virtue vein will be commenced.

Water at a depth of 550 feet in the shaft at the Flagstaff mine settles the problem of ore reduction by the French Flagstaff Company. There is now nothing to retard the process of mill building.

BRITISH COLUMBIA.

Spokane *Chronicle*: The Horne-Payne Syndicate has secured a bond on the True Fissure claim in the Trout Lake district. The bond calls for $50,000 with a substantial cash payment. This makes the fourth claim that this company has secured control of in the Trout Lake district, the others being the Broadview, Phillipsburg and Old Sonoma.

Frank Watson who is directing the work on the Fisher Maiden mine near Silverton has recently secured a bond on the Arlington and Burlington properties on Springer creek for $50,000: $5,000 in cash and the remainder in several short payments.

During last week twelve Slocan properties shipped ore to the amount of 658 tons. The Payne mine headed the list with 200 tons to its credit, the Slocan Star came next with 120 tons, followed by the Ruth with ninety tons.

Spokesman-Review: At Rossland in the Kootenay and Columbia but one stope is being carried along, and the output is averaging fifteen to twenty tons of high-grade ore.

In the Sunset No. 2 the Canadian Gold Fields Syndicate have sunk the shaft to a depth of 50 feet in almost a solid 4-foot streak of high-grade shipping ore. At this depth a drift was run to the west for a distance of 70 feet and showed up a body of ore of the same class on the average, being 36 inches wide.

The ore body recently struck in the White Bear continues to improve in width and grade, and is now fully 15 feet wide, the last four feet of which, says one of the principal stockholders, is of good shipping value at the present rates of transportation and treatment.

UTAH.

Mammoth *Record*: The ore body which was encountered in the Boss Tweed last week is proving to be a bonanza. It is the intention of the company to erect an ore house and put in a whim as soon as the deep snow disappears.

The vein in the Sunbeam shaft has widened to four feet, and some recent assays show sixty ounces of silver. As depth is being attained the vein matter becomes more mineralized.

The new 24x40 foot shaft-house has been completed and all arrangements have been made for going on down to a good depth at the Last Chance.

The stockholders of the Sunbeam have allowed the option on the Joab Lawerence ground to lapse, and the probabilities are that a new company will be formed to develop the claim.

A contract has been let for continuing the shaft of the Southern Eureka down another fifty feet.

A force of five men started work on the Anna Laura, and will push the shaft on down.

Silver City *Star*: A strike of a 4-foot vein of ore is reported this week at the Sunbeam. Another ore strike is reported in the Swansea this week. The new strike is on the 550-foot level and is said to be 7 feet wide and running well in silver and lead, with a high percentage of iron.

It is said to be doubtful that the Centennial Eureka Company will make a contract with the smelters for their output owing to the exorbitant charges for smelting.

IDAHO.

Mining Journal: In Boise county six men have been at work on the Jupiter this winter. A tunnel 650 feet in length has been run, 150 feet of this distance being on the ledge. The ledge varies from 30 to 40 feet in width and all carries gold.

A payment of $1000 on the Illinois mine was telegraphed to Boise from Denver by W. G. Shedd. Mr. Shedd has held a bond on the mine for some time.

The output of the Lucky Boy at Custer averages fifty tons a day, and in addition to the company's mill its ores are now being put through the Black plant.

Boise basin placer miners look for a long and prosperous season the coming summer. Early snow with rain has packed the snow in the mountains so that it will me t very slowly.

De Lamar *Nugget*: At Dewey the Florida Mountain Mining Company has discharged all its miners except the half dozen employed in running the drift upon the lower level, and the new and splendidly equipped mill at Dewey has ceased to drop its stamps. It was one of those common instances where a mill was built before the mine was ready to supply the material to keep it running; but such instances usually occur with properties on which a stock deal is being manipulated, which was not the case in this instance. About seventy-five men have been laid off at the mine and mill, and the village of Dewey with its magnificent hotel, about ready to be opened, its splendid mill and fine store and other buildings are in a condition of desuetude.

MONTANA.

Miner: A half interest in the Snohomish mine and a one-third interest in the Tramway has passed from the heirs of the McNamara estate to F. Aug. Heinze and the Montana Ore Purchasing Company. For the half interest in the Snohomish about $100,000 was paid, and $25,000 was the amount agreed upon for one-third of the Tramway lode claim.

On the Big Bonanza, a silver property, near

Walkerville, under lease to Rosenthal and Wilson, a 12-inch vein has been cut at a depth of 100 feet that assays 125 ounces to the ton in silver.

In the Altoona, at the mouth of Horse canyon, a shaft is now down 300 feet and another 300 feet will be sunk at once. On the Northwestern, also, 300 additional feet will be sunk by the company and a good deal of crosscutting done at each level.

The work of preparing the mines of the Butte and Boston Company for operation is going on steadily under Superintendent Batterman.

Sinking on the Original mine still continues and in a few days the 900 level will be reached. It is probable now that a station will be cut at the 900 level and possibly some exploration work done at that point.

WYOMING.

Wagon loads of steel piping are being sent daily from Laramie to the placers of the Big Horn Mining Company at Independence mountain. About ten of the fourteen miles of ditching have already been completed, and as soon as the weather permits 150 men will be put to work to complete the contract. The company, which is controlled by Denver and Leadville parties, owns over 1,000 acres of ground, which, it is estimated, can be worked for 10 cents per yard by means of the fine plant now being put in. This will cost fully $100,000 when completed. It is estimated, however, that it will not handle more than one-third of the water which the big ditch will carry. Active operations will commence July 1.

Work on the Rockdale placers, on Rock creek, has commenced in good earnest. The properties, consisting of several thousand acres, are owned by the Overland Gold Mining Company. Several thousand dollars' worth of hydraulic piping has been shipped. A force of men is now at work on the grounds, and active operations will begin with the coming of the first snow water, which is looked for about May 1.

SOUTH DAKOTA.

Black Hills *Times*: The Ellison hoist now being constructed by the Homestake Mining Company will, in connection with the steel tramway, represent an expenditure of $250,000. The dimensions of the present buildings are 200x90 feet and the highest part is about 80 feet, which is in the center of the hoist and covers the hoisting gallows. The hoisting gallows is 55 feet from the foundation. This frame is suspended over the shaft which is now down to the 300-foot level. The hoist will be run by a double 800 H. P. engine, which is of the latest pattern and was made especially for the Homestake Company by the Union Iron Works of San Francisco.

Weedon & Card, owners of the Red Cloud group of claims, on Deadwood gulch are extending their main tunnel. It is now in 75 feet and will have to be driven 225 feet farther to intersect the vein of ore now exposed in their old workings.

The Buxton Mining Company have arranged for regular shipments of ore from their Bonanza mine to the smelter. It is reported that from 200 to 300 tons per month will be shipped.

Clark's Forks placers, in the Big Horn country, are now attracting the attention of investors and with proper facilities they may become profitable.

The pay-roll of the Union Hill Mining Company, now operating in and around Galena camp, ranges from $15,000 to $20,000 per month, with every indication that the amount will be more than doubled before the end of the year.

On the Faust group of claims, which consists of thirty-eight locations, the development shaft is down 192 feet and is being sunk from 2 to 3 feet per day. The shaft is now in the blue shales, which are now quite soft, indicating the close proximity of an ore shoot.

Work is being continued at the Tin Crown mica mine, three miles northwest of Custer City, with a large body of excellent mica of large size having been encountered in the workings, which is being cut and boxed preparatory to its shipment to Eastern markets. The property was recently purchased by an Eastern company, who propose to operate it upon a large scale.

COLORADO.

Denver *Republican:* During February the Elkton Consolidated Company shipped a total of forty cars, which it is estimated will return the company, after all treatment charges have been deducted, between $60,000 and $70,000. The mine operating expenses for February will be about $11,000. Some of the ore shipped during the month brought nearly $400 per ton. The shipments for this week were nine cars, part smelter and part mill are. The company now has $212,000 in the treasury.

The production from the Union Company's properties for February amounted to twelve cars, which will return about $14,000. Of the twelve cars shipped, five contained smelter ore and seven mill stuff. The mine operating expenses for the same period will range between $11,000 and $12,000.

Ashton & Richardson, in prospecting from a 40-foot upraise in the 185-foot level on the Claude fraction of the Brother Jonathan have opened 2 feet of sylvanite ore, in what was considered as the footwall by the former lessees.

J. F. Brady of Chicago has ordered a hoisting plant built and will place it over the deep shaft on the Cranks group on Raven hill. The shaft is down 200 feet, and will be sunk perpendicularly to great depth.

The 500-foot station in the Moon-Anchor shaft is finished, and a crosscut for the vein started. In the 400-foot level a narrow seam of ore that has been drifted on for 45 feet has produced six tons that will ship at from $400 to $800 a ton. The property is producing its usual quantity of low-grade ore, and the plant is being increased by the addition of new boilers of 85 H. P. capacity.

On the Pharmacist the new vein in the south drift from the 300-foot station now measures 8 feet across and a considerable quantity of it is sacked for first grade, expected to run $600 a ton.

W. C. Newell has arranged with Buffalo capitalists for money to drive a tunnel 1,000 feet into Grouse mountain from the Arequa slope.

The El Paso Gold King in Poverty gulch is undergoing extensive development, and in accordance with the policy of the management no effort is made to produce more than for operating expenses. Among the surface improvements and increased equipment required before deeper working is possible a third 100 H. P. boiler is being installed, and a larger air compressor is expected before the middle of the month.

At Central City Denver parties intend putting a small plant of machinery on the Only Boy property, on Negro hill, with the intention of spending $5,000 in developing the property.

H. Grier sold his four-ninths interest in the Mexican lode last week to H. L. Morris of Denver and S. V. Jett of Central City, the consideration being a cash one.

The Golden Cloud property, at the head of Virginia canyon, has been leased and bonded by its Central City owners to the Imperial Mining and Leasing Company. The present depth of the shaft is 230 feet, and Superintendent Eby says the company intends to sink about 200 feet, to fully open up and develop the property.

A force of nearly twenty men are employed in the Gettysburg mine, on Bates hill, from which considerable mill ore is being shipped every day. Sinking is being carried on at a depth of 645 feet, the company intending to reach a depth of 700 feet on the present contract.

At the Lotus mine, in Russell gulch, sinking with three eight-hour shifts was resumed on Monday at a depth of 475 feet, the contract calling for 125 feet of sinking.

At the Topeka mine, in Russell gulch, the water is now down to the tenth level, which is a depth of nearly 900 feet, and the two bottom levels are being cleaned out so that leasers can take a block of ground. After the sump is cleaned out, it is the intention of the company to begin sinking.

The arrival in Leadville of Percy St. George of Philadelphia and Mr. J. L. Emerson of Salida means that within a very few days work will be resumed on the Pawnolos mine. This property is located in Big Evans gulch and has lain idle since 1893. At that time the mine was closed down on account of the low price of silver, but it is believed that the big iron bodies which are exposed in it will pay for the development work which may result in opening up other large ore bodies.

The Silver Mountain gold mine at Empire, owned by the Bank of Clear Creek county, has been leased and bonded to a Boston company. A. F. Ross, agent of the company, has purchased new machinery, which is now on the ground, and the further development of the property will commence at once.

At Florence the London and Cripple Creek Reduction Company, which began the erection of a 60-ton mill in November last for the treatment of oxidized gold ores, will begin operations within the week.

The El Paso Chlorination Company will erect a huge plant at this point, which will rank second in point of size of the four reduction plants at this point, as it will be built with a capacity of 150 tons daily. The larger plant is the Metallic Extraction Works at Cyanide, now treating 350 tons daily.

ARIZONA.

Prescott *Journal-Miner*: Superintendent A. J. Doran is running a drift on the 100-foot level of the Yavapai mine, one of the Little Jessie group, and has 4 feet of good ore in the face of the drift.

Col. A. O. Brodie is working about a dozen men on the Crown Point mine in Castle Creek district.

The sale of the Bullard mine may now be considered as assured. The syndicate have six men engaged in the survey and location of a pipe line from Date creek to the mine, a distance of from eighteen to twenty-four miles. They will put up a plant at the mine for the reduction of the ore on the ground. The opening up of this mine, the construction of the pipe line and the erection of a plant necessary for the reduction of the ore, means an outlay of $250,000 to $400,000.

J. C. Rankin, superintendent of Waters mine in the Santa Maria district expects to start up work on that property again within the next few days.

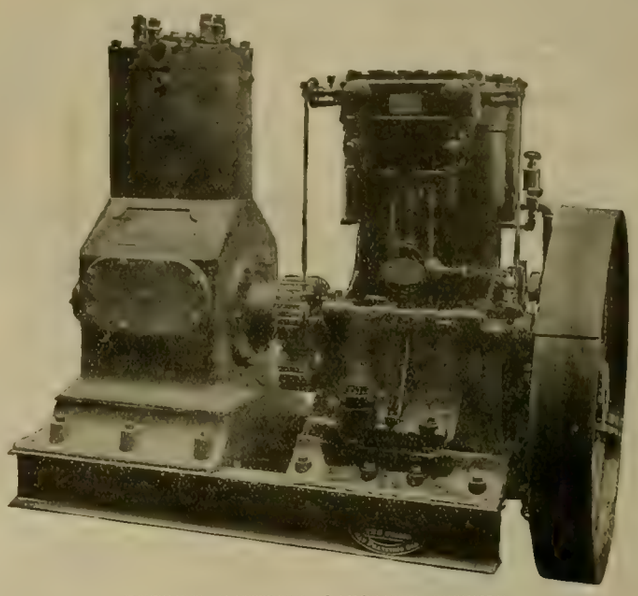
Mr. Strong has also bonded a mine in the Santa Maria district, and expects to put up a mill at once.

The Congress Gold Company has recently made some extensive additions to their plant, and have still others under consideration. This company has had a regular and steady increase to their output for the past two years and are planning to further increase it.

The Planet-Saturn Company is still running its plant, but will add improvements to it in the near future.

AUSTRALIA.

The Broken Hill Proprietary Company's twenty-third half yearly report for the half year ending November 30, 1896, has been received.



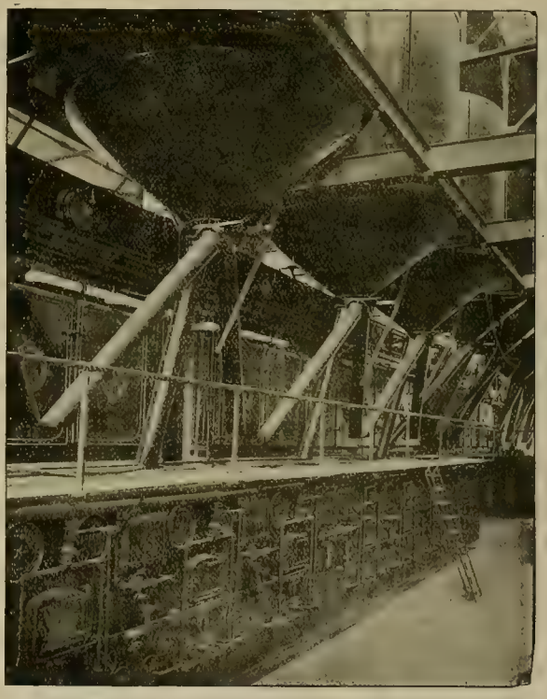
The profits for the six months have been £152,944 13s 11d, out of which sum £144,000 have been distributed in dividends. The total amount of ore mined was 220,916 tons. The following table will give the interesting data as to product and cost of working:

Ore treated, tons	208,303
Fine silver produced, ounces	4,028,292
Lead produced, tons	10,065

	£.	s.	d.
Amount received	674,361	7	3
Value per ton	3	4	9
Expenses, including depreciation	521,416	13	4
Cost per ton	2	10	1
Profit per ton	0	14	8

Duplex "Union" Gasoline Engine.

We show on this page an illustration of the pioneer plant of its kind, being a 20 H. P. duplex "Union" gasoline engine and double cylinder air compressor combined on one base.



DUPLEX "UNION" GASOLINE ENGINE.

Two of these plants have been furnished to a Boston syndicate, represented by Mr. Jas. E. Mills, for use in their Mexican property. The Boston parties are the principal owners of the Calumet and Hecla mines. The engines and compressors were in sections weighing not over 350 pounds each, for mule-back transportation. In the region in which these plants are being operated good fuel and water are rather expensive, and, after a thorough investigation of the merits of gasoline engines for mining purposes, the orders were placed with the Union Gas Engine Company of San Francisco, who are the largest and oldest builders of gas and gasoline engines west of the Mississippi, and claim to have been the first to build successful gasoline engines; the first to successfully use electric ignition, as shown by their patents issued in 1885, and were the first to build gasoline engines for running mining machinery. These plants were thoroughly tested before leaving the works by experts, who were more than pleased with the results shown. *

An Advance in Methods.

Handling coal and ashes by mechanical means is now regarded as essential in all well designed boiler houses. The power station not so equipped is easily recognized by its dirtiness and by the large item on the expense account for shoveling coal and carrying away the ashes. In the Hawthorne Avenue power house of the North Chicago Street Railway Co., Chicago (view of a portion of the boiler room being shown herewith), the coal is delivered by wagons to the coal storage place beneath the sidewalk. From there it is drawn as needed into conveyor discharging into an elevator at end of room, which in turn delivers the coal into a horizontal conveyor running over the cylindrical coal tanks shown in cut. Each tank, of which there are ten, holds twenty-five tons. Capacity of machinery forty tons nut coal per hour. The ashes are drawn through discharge gates, from hoppers in basement under boilers, into a tilting car and run over track to either end of room where Link-Belt elevators raise same to storage pockets at ends of building, from whence they are drawn finally to wagons or scow and carried away.

HANDLING COAL AND ASHES IN BOILER ROOM.

This machinery was designed and installed by the Link-Belt Machinery Co., 39th St. and Stewart Ave., Chicago, whose many devices for the rapid and economical handling of all classes of freight, grain, raw and manufactured products, and for the transmission of power, are so widely employed in this country. They will be pleased to mail their latest catalogues to those interested. *

Scientific Progress.

Electricity Direct From Coal.

There is no likelihood that much more will be heard of the direct generation of electricity from carbon, if what Tesla says is to be taken as true. In a recent address he spoke on the subject as follows: "A great deal is expected from a more economical utilization of the stored energy of the carbon in a battery, but while the attainment of such a result would be hailed as a great achievement, it would not be much of an advance towards the ultimate and permanent method of obtaining power, as some engineers seem to believe. By reasons both of economy and convenience we are driven to the general adoption of a system of energy supply from central stations; and for such purposes the beauties of the mechanical generation of electricity cannot be exaggerated. The advantages of this generally accepted method are certainly so great that the probability of replacing the engine dynamos by batteries is, in my opinion, a remote one, the more so as the high-pressure steam engine and gas engine give promise of a considerably more economical thermo-dynamical conversion. Even if we had this day such an economical coal battery, its introduction in central stations would by no means be assured, as its use would entail many inconveniences and drawbacks. Very likely the carbon could not be burned in its natural form as in a boiler, but would have to be specially prepared to secure uniformity in the current generation. There would need to be a great many cells to make up the E.M.F. usually required." Tesla proceeded to specify a number of other objections to this method of obtaining electrical energy, but the preceding would appear to be sufficient in itself to dampen the hopes of those who have been anticipating the advent of electricity direct from coal.

THE temperature at the bottom of the ocean is nearly down to freezing point, and sometimes actually below it. There is a total absence of light, as far as sunlight is concerned, and there is an enormous pressure, reckoned at about one ton to the square inch in every 1000 fathoms, which is 160 times greater than that of the atmosphere we live in. At 2500 fathoms the pressure is thirty times more powerful than the steam pressure of a locomotive when drawing a train. As late as 1880 a leading zoologist explained the existence of deep-sea animals at such depths by assuming that their bodies were composed of solids and liquids of great density, and contained no air. This, however, is not the case with deep-sea fish, which are provided with air-inflated swimming bladders. If one of these fish, in full chase after its prey, happens to ascend beyond a certain level, its bladder becomes distended with the decreased pressure, and carries it, in spite of all its efforts, still higher in its course. In fact, members of this unfortunate class are liable to become victims to the unusual accident of falling upward, and no doubt meet with a violent death soon after leaving their accustomed level, and long before their bodies reach the surface in a distorted and unnatural state. Even ground sharks, brought up from a depth of no more than 500 fathoms, expire before they gain the surface.

SINCE the Madagascar campaign the value of aluminum army utensils is no longer doubted in France. Cooking and other utensils, altogether 15,000 sets, made of aluminum, proved entirely satisfactory. M. Moissan, member of the French Academy of Sciences, says in his report to the Minister of War on the labors of the commission appointed to inquire into the usefulness of aluminum for military purposes: "The committee is now in possession of full information in regard to the value of camp utensils manufactured of aluminum. The French industry is able to produce cooking utensils of aluminum by stamping, including pots, pans, cups, etc., for the whole army. The armature of helmets of aluminum has been left aside for the time being, as it wears out too quickly."

A TEST of the purity of metals, rivaling the spectroscope in delicacy, has been pointed out by Prof. J. A. Hennig, who has found that the electrical conductivity of pure metals is immensely increased by intense cold, while the increase in alloys is not more than 10 per cent.

Mechanical Progress.

Continuous Rails for Street Railroads.

Continuous rails, made up of ordinary rails length welded together electrically, are in use on many miles of electric street railways in the United States, and with excellent results, too, having shown themselves to constitute an ideal track. Whatever misgivings may have arisen at one time as to the serious pranks which expansion and contraction might play with such continuous tracks have been effectively allayed, as experience has shown that the difficulties likely to grow from these causes are not extraordinary. It is interesting, however, to note that of the troubles from temperature variations in the track, that due to a temperature lower than the one at which the rails were welded is the only one requiring serious consideration. It is found in the tendency of the rail to shrink in a longitudinal direction, and this must be counteracted by a pull on the ends of the rail sufficient to produce a corresponding amount of stretch. Temperatures above that at which the rails were welded cause compression, and this has never been found to make trouble where the track was at all secured by the roadbed.

Experience, therefore, would seem to point to the winter season as the time for welding continuous track, as then the rails are materially contracted, and, though exceptionally cold snaps may be productive of a slight state of tension in the rails, yet the maximum stress would be nothing like that in rails welded in the summer, and probably far below the strength of the welds. —Cassier's Magazine.

The Largest Reservoir in the World.

The Metropolitan Water Commission is about to build the largest storage reservoir in the world, its capacity being no less than 65,000,000,000 gallons, enough to supply the city of Boston for three and one-half years, and four times as much as the capacity of all the existing waterworks reservoirs of that city. Its capacity is twice as much as that of the new Croton reservoir of New York; thrice that of the six reservoirs of Birmingham, England; thirty times that of the Cochituate, and twenty-five times that of Hobbs Brook of the Cambridge system. It will hold more water than the inner harbor of Boston. This dam is to be built at Clinton, Mass., and the vast volume of water, covering over 4000 acres, will be entrapped and retained by a dam 1250 feet long (or 20 feet shorter than the Croton dam), 127 feet high above the ground, and 158 feet high above its rock foundation. This is, however, not as high as a number of others which retain much less water. The Croton dam has a height of 157 feet above ground and 225 above rock. —Engineering Magazine.

IN 1840 a pound of coal propelled a displacement weight of 0.578 ton eight knots; but the earning weight was only one-tenth of this, as 50 per cent of the displacement represented the machinery and fuel, 40 per cent of the hull, and 10 per cent, or 0.057 ton, the cargo. In 1850, with iron vessels and the screw propeller, a displacement weight of 0.6 ton was propelled nine knots by the pound of coal, but the proportion of cargo had risen to 27 per cent, or 0.16 ton. In 1860, with high boiler pressure and the surface condenser, 0.82 ton displacement was propelled ten knots, and the cargo was 33 per cent, or 0.27 ton. In 1880 the compound engine was in full swing, and 1.8 tons displacement was propelled ten knots, and the cargo was 50 per cent, or 0.9 ton. In 1880, in the freight steamer, 2.1 tons displacement was propelled ten knots, with still 50 per cent, or 1.05 tons of cargo. In 1895 there were two classes of freight boats. The "tramp" propelled thirty-four displacement tons eight and a half knots, with 60 per cent, or two tons of cargo. At the same time the huge cargo steamers of the North Atlantic were driving a displacement of 3.14 tons twelve knots, with 55 per cent, or 1.7 tons of cargo. On the express passenger steamers the cargo weight is down to 0.09 ton per pound of coal.

A TYPE of passenger coaches finished with copper on the outside rather than the usual paint and varnish is being put into service on the New York, New Haven & Hartford railroad. The advantage of this is that the cars are more readily kept in a condition of cleanliness and brightness, and when it is necessary to send a car to the shops for an exterior overhauling, it is ready for the service again in half the time required to paint and varnish it. All the wood panelling and sheathing is made in precisely the same manner, and a light coating of copper is formed around the wood, fitting closely into all the curves and corners. Each piece of sheathing and its strip of copper are passed through the machine simultaneously and come out ready for use with the copper wrapped tightly around the wood. After the sheathing and other members are covered or plated with copper, they are applied to the body of the car in such a manner that the exposed surfaces are not punctured by nails or other fastenings, so that when completed the casual observer would not notice but that the car was finished with paint and varnish. All joints are watertight.

ISMAY, IMRIE & Co. of the White Star steamship line have authorized Harland & Wolff of Belfast, Ireland, to build for the Liverpool and New York service a twin-screw mail and passenger steamer 704 feet long, in which extreme speed will be subordinated to the comfort and convenience of passengers. The new steamer will be 25 feet longer than the Great Eastern, hitherto the longest vessel ever built, and 65 feet longer than any vessel now afloat or in process of construction.

Electrical Progress.

"Phase."

The thorough comprehension of the meaning of the word "phase" has been attended with considerable difficulty by students engaged in electrical engineering. It seems that two views may be taken which appeal respectively to the theoretically inclined and practical mind, says the *Electrical Age*. The mathematical and physical interpretation of the term invites certain attitudes on the part of the student, endeavoring to enlist his sympathies and exercise his power of mental absorption in both directions at once. It becomes necessary to appreciate the full physical meaning of a phenomenon which, although peculiarly involved with the flow of electrical energy through a circuit, is in certain respects of a common and familiar nature. There are many occasions when a perceptible period of rest occurs between an active cause and its effect—the lightning flash and the subsequent silence until the deep reverberation and boom of atmospheric tidal waves are heard re-echoed with deafening intensity.

And in the flow of a current, between its condition of fullness and moment of origin, an interval elapses. When an electro-motive force is applied to create a flow through a given resistance, the maximum flow is not an instantaneous result of it, but a comparatively gradual growth takes place. It is as though the wire suffered from a material incapacity to instantaneously convey the electrical energy at its maximum value onward. It therefore becomes evident that if the retardation or self-induction were entirely absent, the current would attain its full strength the instant the electromotive force was applied. Phase is a term signifying time, whatever may be its cause, and its existence is due to the lack of immediate correspondence between an electromotive force and the current it excites in a given resistance. If a circuit has no self-induction and no electrostatic capacity, the maximum value of the current would be produced at once. Whatever symbolic references may be made to the meaning of phase, and in whatever relation it may be held to other phenomena, let it be always understood as a purely physical phenomenon at the first, and then let the student, with this clear conception in his mind, proceed to invade that other world of relationships, that wide-stretching panorama of exactitudes and sine functions.

AN electric landau caused some sensation on the London streets lately. It demonstrated the fact that the horseless carriage can be steered through the crowded thoroughfares with facility.

A NEW YORK electrician has devised a scheme for the indefinite preservation of eggs by an electric current sufficient in strength to destroy germ life.

Practical Information.

Occasionally Forgotten.

Specific heat is the measure of the capacity of any substance for heat, or the ratio of the amount of heat required to raise the temperature of a substance 1 degree to the amount of heat required to raise an equal weight of water to 1 degree F.

The specific heat of water is 1; cast iron, .13; steel, .11; air, .23; copper, .10; lead, .03; steam, .48.

Heat units required to raise the temperature of any substance: Multiply weight of substance in pounds by number of degrees to be raised, and this product by the specific heat.

A heat unit is amount of heat required to raise the temperature of one pound of water 1 degree F.

A heat unit is capable of doing 772-foot pounds of work, or 772-foot pounds of work done is capable of producing one heat unit.

The foot pound is the unit of work done, and one pound weight moved one foot.

Force is that which tends to move any weight, and the work done by the force is measured by the intensity of the force, times the distance through which it acts, measured in the direction of the force.

Power is the rate at which any agent can work, and is the product of force, distance and time.

The unit of power is the horse power, and the doing of 33,000-foot pounds of work in one minute.

Sensible heat can be measured by the thermometer. Latent heat is the heat required to convert one pound of water at a given temperature into steam at same temperature.

A pound of good coal contains about 14,500 heat units.

The Congressional Library.

In building the National library at Washington so careful has the expense, $6,000,000, been guarded, that it was found possible, as the building approached completion, to go more largely into interior decoration than was anticipated in the original estimates. As a result, the building is extremely rich in its interior finish, abounding in marbles of all the choicest varieties, mosaics and frescoes, and it is so full of daylight in nearly every portion that its beauties can be perfectly seen; in this respect it differs from most of our best

public edifices. In plan the building is simply a cross, with two long arms and two short ones, set down in a hollow square, leaving four large courtyards. In the center of the cross is the octagonal reading room, occupying a magnificent rotunda. The long arms of the cross, extending northward and southward from the reading room, are the great twin book-stacks, each of which is nine stories in height and will contain 800,000 volumes. Electric book railways, on the principle of an endless chain carrying small racks, connect every part of the stacks with the delivery desk in the center of the reading room.

By the operations of the copyright law since 1876, the Congressional library has secured for its shelves one copy of every book (with very few exceptions) published in the United States, besides a second copy of each, which is preserved and filed for use as documentary evidence in law cases involving copyrights. With much that is practically worthless, the library has thus gathered every valuable work issued in this country for a score of years, while, by purchases abroad, it has aimed to keep fairly well supplied with the important publications, of not too special character, of every European country.

Packing of Goods for Chile.

Consul Dobbs writes from Valparaiso: "Many American manufacturers still do not seem to realize the harm they are doing themselves and American trade generally by putting up their goods in too slight packages. Shirts, soap, toilet articles, and many kinds of canned goods, just exactly the packages which offer most temptation, often come in very thin boxes, without any protection in the way of wire or sheet-iron bands, nailed with short, wire nails, easily drawn, and the Chilean longshoreman or lighterman, expert in the use of the short, strong knife he carries, often makes a nice plunder right under the eyes of the officers of the steamers. Then, again, in heavier articles, which offer no temptation to theft, the cases are not strong enough to withstand the very rough handling they receive. The peon likes to see a good smash, and not only handles the cases roughly, but if he is not watched will deliberately drop a case in such a way as to smash it, just to see it break, and with the same enjoyment that a small boy throws stones through a window. Whenever possible, packing should be done in such a manner that the package could not be broken open by ordinary means or by being dropped. A case in point occurred the other day. A lot of miscellaneous bronze and brass repairs for mining machinery came in what was a little stronger than a cracker box. It broke open in the ship's hold, and certainly many small parts were lost, probably some of them of vital importance. A peon was detected in carrying off some small castings in his bundle, not that they were of any use to him, but simply apparently for the sake of stealing. A prominent Chilean importer of American goods said to me the other day: 'If American manufacturers only knew how to pack goods as well as they know how to make them, American trade in South America would very soon make a better comparison with English and German trade than it does to-day.'"

MR. WM. CLIFFORD of Pittsburg, Pa., at a recent meeting of the Ohio Institute of Mining Engineers, gave a *resume* of the anthracite industry and the present magnitude of the same, reminding his hearers that coal is now in the earth's crust—none is being formed at the present time. He gave it as his opinion that, at the present rate of consumption, 1000 years will probably be the limit of our available fields, but the consumption is doubled every ten years. The coal of the world is not likely to last as long as the human race.

Wanted: Good Engine Lathe.

24 to 30-Inch Swing. State condition, maker's name, and price. Address "LATHE," Mining and Scientific Press, San Francisco.

PROPOSALS FOR ROCK CRUSHER.

The Board of Supervisors of Butte County, California, hereby invites plans, specifications and proposals for furnishing the following named machinery, viz:

One Rock Crusher, with a capacity for crushing not less than 12 to 15 tons of rock, or cobble-stones 6 to 9 inches in diameter, per hour, at ordinary speed, rock to be crushed to not over 2 inches in diameter. Bids to state the price per foot for elevator attachment, and of rock screens.

One Road Roller, not less than 5 feet in width and to weigh not less than five tons.

All of the above machinery to be first class in every respect.

Bids will be received by the Clerk of the Board at his office in Oroville, Butte County, California, up to Wednesday, April 7, 1897, at 10 A. M. The right to reject any and all bids is hereby reserved.

By order of the Board of Supervisors.

ED HARKNESS, County Clerk.

Oroville, Cal., March 9, 1897.

WANTED.

—A—

Hoisting and Compressor PLANT,

Complete with BOILERS, PUMPS, Etc.

Hoisting Engine Must Be Double Drum and Capable of Hoisting One Thousand Feet.

Send full particulars to

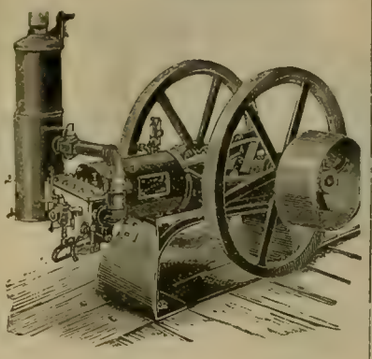
MACHINERY,

This Office.

Wanted:

Some quartz mining company who are just starting out in business, or a company who are dissatisfied with their superintendent, or some manager who is dissatisfied with his assistants, or any one in the mining business to give me a job. I have a job, but I want a better one. I WANT MORE WORK AND I WANT MORE PAY. I have run the whole works of a 60-stamp plant. I can make an assay, retort and melt bullion, build roads and bridges, keep books, run a store—in short, I can do what a mine manager should be able to do. I am 33 years old, am married, and will contract for two or more years with a responsible party anywhere on earth. Could begin shortly after a proper agreement was entered into. CAN FURNISH REFERENCES TO SATISFY THE MOST SCRUPULOUS. To avoid delays, address

JOHN P. SCHMIT,



1301 SANTEE ST.,

LOS ANGELES.....CALIFORNIA.

Cripple Creek—Its History to Date, Illustrated.

Just out, with correct map and costly full page views natural as life. This great book will be sent free prepaid with our big 56-col. family paper 3 months on trial for 25c (stamps or silver); club of 6, $1. Latest mining news. Mention The Press and address *Illustrated Weekly Sentinel*, Denver, Colo.

Cheap Power!

SAVE MONEY BY USING

—THE—

"DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav..	7½ galls.	at 5c..	$.37½
Distillate.....	40 "	7½ "	8c..	.60
Domestic Coal Oil....	40 "	7½ "	12½c..	.93¾
Gasoline.....	74 "	8¾ "	15c..	1.31¼
City Gas.....	1000 feet,			2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

PROSPECTING BATTERY.

UNION IRON WORKS,

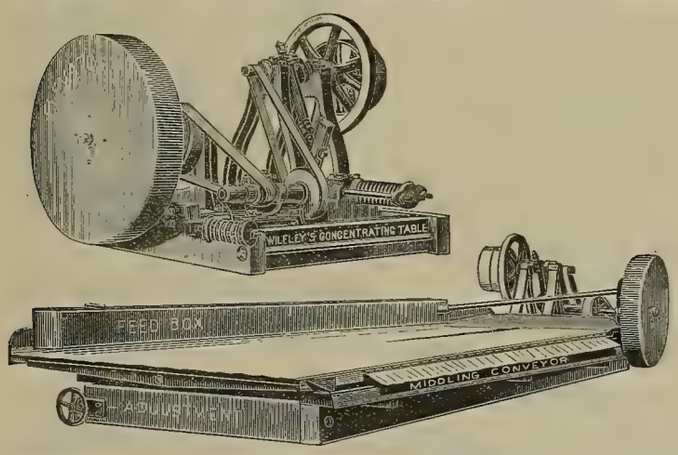
222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS



Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

The Mine and Smelter Supply Co.,

. . . DENVER, COLORADO, . . .

ARE SOLE AGENTS FOR THE

Wilfley Concentrating Table,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Anyone can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.

ROMLEY, COLO., Jan. 19, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Answering yours of the 5th inst., would state that after a thorough trial we have discarded seven Woodbury Tables and two Johnsons and adopted the Wilfley Concentrating Table, which we think up to date is the best table in the market, so far as our knowledge is concerned. Yours very truly, [SIGNED] B. B. MORLEY, M'g'r Golf M. & M. Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 Howard Street, San Francisco, Cal.

Coast Industrial Notes.

A Muncie, Indiana, glass manufacturer has an order for sixty carloads of glass for San Francisco to replace European glass, which has heretofore supplied the Pacific coast.

—Two-fifths of the orange crop of southern California this year comes from Riverside, where there are 20,000 acres in orchard, the net earnings of which are estimated at $1,000,000, or $50 an acre.

—The Great Northern and Northern Pacific railroads are soon to run solid trains over the O. R. & N. road. It is understood that the Great Northern will change its terminus from Seattle, Wash., to the Columbia river.

—The Columbia Southern Railroad, capital stock $100,000, has incorporated at Dalles, Or. The terminal points are Biggs Station, on the O. R. & N., and Prineville, Or. The contract specifies that construction shall commence May 1.

—As a sample of the variety in California climate, at Moosa, San Diego Co., last week, the wife of Warland Tower made ice cream from ice frozen naturally 500 feet distant from the orange orchard wherein it was eaten some hours later, and freshly plucked strawberries furnished the flavoring.

—The Redondo Railway Beach and Hotel Companies have re-elected President L. T. Garsney, Vice-President P. T. Morgan, Secretary and Treasurer H. B. Ainsworth. The stockholders have authorized the purchase of steel rails to replace the company's tracks between Los Angeles and Redondo.

—The beet sugar factory to be erected near Salinas, Monterey county, Cal., will be the largest in the world, and with its warehouses, etc., will cover 523 acres. The largest building will be 586 feet in length, 106 feet wide and six stories high. The crushing capacity will be 3000 tons daily, which will produce 450 tons of refined sugar.

—The construction of another large ditch in southern Oregon is proposed, tapping Rogue river on the north side, the capacity of the ditch to be 10,000 inches and the course about 70 miles. It is claimed that 15,000 acres of farming land and 3500 acres of mineral land will be subject to the proposed ditch. The cost is estimated at $400,000.

—Proposals have been made to the Mexican Government by an American syndicate for the purchase of the Tehuantepec Railway, and the subject submitted to a special committee for consideration; it will not be countenanced. A corps of engineers has been appointed by the department of communications to report on the probable cost of improving Salina Cruz and Coatzacoalcos harbors with a view of shortly inaugurating work.

—Receiver C. J. Smith of the Oregon Improvement Company reports in operations for the year ending November 30, 1896, that the total earnings of all branches were $3,221,620.75, as compared with $3,258,503.75 in 1895—a decrease of $36,883. The operating expenses were $2,867,380.37, as compared with $2,868,586.37—a decrease of $1206 14. The net earnings were $354,240.38, as compared with $389,917.24—a decrease of $35,676 86. The Pacific Coast Steamship Company has a profit balance for the year of $4373.82. The Pacific Railway Company shows a loss of $68,929 06. The Columbia and Puget Sound Railroad, a local coal road, has a profit balance of $118,216.21. The Seattle and Northern made a profit of $12,969.61. The Port Townsend Southern Railroad was run at a loss of $13,783.07. The coal sales of the company were 15,000 tons in excess of the previous year, and profits were about $11,000. The receiver says this was accomplished in the face of the lowest prices ever made on foreign coal in the San Francisco market.

Recent California Mining Incorporations.

Amargosa Mining and Milling Company, Los Angeles; capital stock $1,000,000—$800,000 subscribed. E. T. Loy, J. H. Hurin, H. B. Eakins, D. C. Naver, Los Angeles; P. J. Keeler, Santa Monica.

Marguerite Gravel and Quartz M. Co., San Francisco; capital stock, $2,000,000—$1,996,000 subscribed. W. J. Smith, C. H. Parrish, L. Reckless, J. F. McNamara, C. H. Smith.

Trophy Mining Company, Ferndale, Humboldt county; capital stock, $100,000—$70,000 subscribed. T. Dungan, China Flat; C. A. Berding, H. C. Blum, C. H. Dungan, J. Smith, Ferndale.

Big Seven M. Co., San Jose, Cal.; capital stock, $100,000—$43,750 subscribed. H. C. Pfister, W. Denker, G. Loeb, A. J. Rhein, W. A. Bowden, San Jose.

Petticoat Mining Company, San Francisco; capital stock, $500,000—$100 subscribed. C. Gross, J. T. Henry, H. McAllister, I. Frohman, G. B. Tennant.

Valmere M. and M. Co., Los Angeles; capital stock, $300,000—$50,000 subscribed; F. E. Nelson, Los Angeles; R. A. Matthews, N. Ross, Randsburg; J. T. Matthews, Needles; J. Suter, Barstow; M. A. Graham, San Diego, Cal.; C. R. Matthews, Williams, Ariz.

Recently Declared Mining Dividends.

Silver King, Utah, $37,500, payable March 10.

Utah, Utah, $2000, payable March 10.

Bullion - Beck, Utah, $50,000, payable March 20.

Ontario, Utah, $15,000, payable March 4. The total to date is $13,385,000.

Daly, Utah, $37,500, payable March 4, a total of $2,965,000.

Personal.

W. E. HOWARD is engaged in developing the Montezuma mine at Alamo, Lower California.

FRANK A. LEACH of Oakland will succeed Jno. Daggett as superintendent of the San Francisco mint.

G. MORTON, second vice-president and treasurer of the Mexican National Railway, is visiting San Francisco.

W. L. AUSTIN of Denver has been elected president of the Colorado Scientific Society, and Irving Hale first vice-president.

ALF. TREGIDGO of Nevada county will be appointed by Gov. Budd State Debris Commissioner to succeed John F. Kidder.

WILLIAM A. HAWLEY of Grass Valley, Cal., has returned from South Africa, where he has been superintending a mining property.

FRANCIS HEURTEVANT, who is interested in large mining operations at Red Hill, Trinity county, Cal., returned last week from a visit to France.

JAS. CRONAN has resigned the superintendency of the Hale & Norcross mine, Virginia City, Nev., to look after his Rossland, B. C., mining interests.

COL. GEORGE STONE, president Santa Rosa & Sonoma County Electric Railway, is in New York to negotiate the sale of $700,000 worth of the company's bonds.

CHARLES F. HOFFMAN, who is in Siberia, in the interests of a syndicate controlling large gravel deposits, was at last accounts at Blagoverschensk, on the Amoor river.

RUSSELL L. DUNN, who went to Siberia last summer to examine and report upon extensive gravel mines controlled by a Parisian syndicate, has returned to San Francisco.

G. F. HERR, recently traveling passenger agent of the Union Pacific, is promoted to the office of division passenger agent of the Southern Pacific, with headquarters at Los Angeles.

JAMES F. WARDNER has for some time been operating in mines at Rossland and Trail, British Columbia. Not long since he had occasion to go East, and asked the agent at the Kootenay town he was in for a pass. A telegram was sent to headquarters for instruction and the answer that came was: "Don't let Jim walk." The wily agent obtained some subsistence from Mr. Wardner by changing the telegram to "Don't; let Jim walk," before handing over the pass.

THERE are 360 mountains in the United States which have a height exceeding 10,000 feet. The greatest number is in Colorado and Utah.

Book Reviews.

Gas, Gasoline and Oil Vapor Engines: By Gardner D. Hiscock, M.E. This is the first book on the subject of explosive motors published, and it cannot but fill a want, for there has been a great deal of attention given of late to this class of machinery. The use for larger power has so greatly increased the field that a good work on the subject has become almost a necessity. This work is designed for the general information of every one interested in this new motor power. The book treats of the theory and practice of gas, gasoline and oil engines, as designed and manufactured in the United States. It also contains chapters on horseless vehicles, electric lighting, marine propulsion, etc., and is illustrated with 220 engravings. Published by Norman W. Henley & Co., 132 Nassau St., N. Y. Price, $2.50.

Annual Report of the Board of Regents of the Smithsonian Institute: This work contains much matter that shows the good that is being done with the income from the foundation of James Smithson. Among the articles in the appendix are: "On the Magnitude of the Solar System," by William Harkness; "Terrestrial Magnetism," by Prof. W. A. Rucker; "The Age of Electricity," by M. Mascart; "Weather Making, Ancient and Modern," by Mark W. Harrington; "The Promotion of Further Discoveries in the Arctic and Antarctic Regions," by Sir Clements W. Markham.

Gold in Australia.

The value of the gold raised in the various colonies differs very materially, as will be seen from the following table, giving the yield and value in 1895:

	Weight, ozs.	*Value, £*	*Value per oz. £ s. d.*
New South Wales	360,165	1,315,929	3 13 4
Victoria	740,036	2,960,344	4 0 0
Queensland	626,299	2,210,887	3 10 6
South Australia	47,343	128,812	3 14 5
West Australia	231,513	879,748	3 16 0
Tasmania	54,964	212,730	3 17 10
New Zealand	293,491	1,162,164	3 19 10
Australasia	2,353,811	8,870,644	3 15 4

The gold yield of Western Australia for the year 1896 amounted to 281,265 ounces, being an increase of 49,753 ounces as compared with that of the previous year.

At the Broken Hill Proprietary mines 27,591 tons of ore were treated for the four weeks ending February 4, and the output from the refinery was 413 ounces gold (estimated), 584,655 ounces silver, 2323 tons lead, 58 tons antimonial lead (estimated), and 386 tons copper matte, containing 59 tons copper (estimated), and 38,838 ounces silver (estimated).

London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTATING GRAVITY ENGINE.—Henry L. Lightner, San Francisco, Cal. No. 578,062. Dated March 2, 1897. This invention relates to an improvement in engines. It consists essentially of cylinders standing radially with relation to a journal shaft to which they are centrally connected so as to revolve therewith, weights slidable from end to end of said cylinders, pipes connecting the opposite ends of the cylinders with the hollow shafts or trunnions about which they are revoluble, and a supply pipe connected with one end of the shaft, valves whereby steam is admitted under pressure into the cylinders, an actuating device by which the valves are opened when the ends of the cylinders successively pass the lowest point in their revolution so that the weights are forced to the opposite and upper ends of the cylinders, exhaust pipes connecting the ends of the cylinders with the shaft or trunnion opposite to the inlet pipe for the escape of steam and mechanism for opening the exhaust valve when they reach the upper part of their revolution so as to allow the escape of steam and the free movement of the weights in that direction.

FRUIT GRADER.—Smith McGarvin, San Jose, Cal. No. 578,067. Dated March 2, 1897. This invention relates to an improved apparatus for grading fruit, and especially prunes and other fruits which may be of different sizes and which it is desirable to separate from each other. It consists essentially of a series of superposed oppositely inclined screens having perforations of diminishing diameter from the top to the bottom, parallel receiving floors beneath each screen, means for discharging from each of said floors to the screen next below, a means for discharging from the lower ends of each of the screens into receiving boxes and oppositely oscillating frames at each end of the screens to which said screens are connected alternately so that those inclining in one direction will be carried by one frame and those in the other by the opposite frame. Springs connect each frame with an intermediate fixed support so as to give them an upward and return movement and partially counterbalance the frames in their movements. In conjunction with this is a hopper having a flexible bottom, the free edge of which rests against the slats of the distributing belt or elevator so that each slat in passing will take away a certain amount of the fruit and deliver it upon the screens while the flexible bottom prevents the escape of any portion through the bottom.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1896.

BRADLEY PULVERIZER CO. *Gentlemen*:—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker, and they average about 20 tons to each machine, 40 mesh fine, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills.** We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisbie Lucop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DELAMAR.

HOW 10 GRIFFIN MILLS WORK.

DELAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

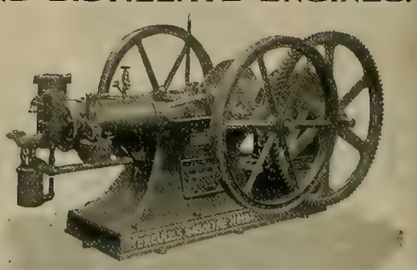
BRADLEY PULVERIZER CO. *Gentlemen*:—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager*.

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.



HERCULES GAS, GASOLINE AND DISTILLATE ENGINES.

HOISTING ENGINES, 2 h. p. to 200 h. p. ✦ **STATIONARY ENGINES,** 1 h. p. to 200 h. p. ✦ **MARINE ENGINES,** 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ¼ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.

NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

In Connection with the Denver & Rio Grande.

For information, address C. F. ELLIOTT, General Traffic Agent, DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado, send to

Market Reports.

The Markets.

SAN FRANCISCO, March 11, 1897.

Business continues fair, with a steady increase in arrivals of merchants. They report roads in nearly all parts of the State almost impassable, which makes distribution slow. With clear weather for a few days travel will be better, when a large consumption demand is looked for. The feeling with the trade seems to be gaining strength that business this spring will be larger than for several years. With iron workers a good business is reported, chiefly on previous orders, although new work is being figured on. It is confidently expected that there will be an enlarged demand in structural and railroad materials and mining machinery and supplies.

The local money market continues to show a steadily growing ease. Idle money is coming out, which will make itself favorably felt within the next thirty days. The banks express more confidence in the future, which will cause them to put out more money. Gold coin sent from this city to New York from January 1, 1897, to March 1, aggregated over $8,000,000. Of this amount the United States Treasury sent $2,000,000. It is stated that there is more inquiry for funds on realty, but borrowers do not like to pay asking rates of interest, believing that a lower range will rule before long. The East reports general ease at all money centers. It is the belief that an improved demand for funds is near at hand. This opinion is grounded on all advices pointing to a larger business in all branches of trade, except luxuries, than for four years, which will necessarily call for more accommodations by manufacturers to meet the demand.

New York Silver Prices.

NEW YORK, March 11.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29¾	64
Saturday	29 5-16	63⅞
Monday	29¼	63¾
Tuesday	29 3-16	63⅝
Wednesday	29¼	63⅞
Thursday	29 3-16	63⅝

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 40	10 25@12 50	13 45
Saturday	12 00	3 40	10 25@12 50	13 45
Monday	12 00	3 40	10 25@12 50	13 45
Tuesday	12 00	3 40	10 25@12 50	13 40
Wednesday	12 00	3 40	10 25@12 50	13 40
Thursday	12 00	3 40	10 25@12 50	13 40

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	7½c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.86¾
London Merchants	$4.85
London Sight Bankers	$4.88¾
Refined Silver, per oz., 1000 fine	63⅝
Mexican Dollars	51

SILVER.—The market eased off still more the past week, closing barely steady. There is a light demand for India, which has its effect, while from other sources the call is only fair. A strong probability that Japan will adopt the gold standard has its effect also. The export movements from New York are not large, the drop evidently having interfered. The last steamer for China took out $265,700 of silver. For the first two months of the calendar year the export movement by water was $1,055,450.

MEXICAN DOLLARS.—The market has been quiet. The last China steamer took out 84,902 dollars. For the two months ending March 1st the shipments aggregate $1,242,911.

QUICKSILVER.—The market is fairly strong on this coast, at the East and abroad. The demand is said to be improving. For the first two months of the calendar year receipts at this port aggregate 2438 flasks, against 7689 flasks in the same time last year, and the exports aggregate 909 flasks this year, against 4504 last year.

Our market is quoted at $40 for domestic consumption.

BORAX.—The outward movement continues fairly free.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5¼
Powdered, in car lots	5
Concentrated, "	4½

COPPER.—The market seems to be sustained at the East by force. With any easing up prices will have to go off. The opinion prevails that with the India demand improving, better prices will rule even in the face of an increased output. There is an absence of any speculative demand.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	—@13½
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

LEAD.—The market has held to firm figures. Eastern advices state that the demand continues good for the season of the year, in this country and in Europe.

Our market is quoted in jobbing lots as follows:

Pig	3 75	@	3 85
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—The demand is only moderately fair.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do,	"	"	1 45

TIN.—For both pig and plate the market is quiet. The former is firm, but the latter is irregular owing to more or less cutting between American and foreign.

We quote as follows:

Pig, per lb	14¼c@—
Plate, I C coke, heavy, per box	$4 05@—
" " " light, "	3 95@—

IRON.—Pig is essentially unchanged. The imports of foreign continue free. The consumptive demand is light owing to considerable having been bought to arrive. At the East markets are reported unchanged. The consumption promises to exceed any former year. England fears the competition from this country.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The demand is fair for all grades. The market is unchanged.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 50@ 6 00
Coos Bay	—@ 5 00
Cannel	8 00@— —
Egg, hard	12 00@13 00
Wallsend	— —@ 6 50

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steadier. Our market is quoted at 7⅛@8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6½@6⅝c for Hallett's and 6½c for Japanese.

POWDER.—The demand is strong. No change in prices is reported up to this writing. The market is quoted as follows:

Hercules, No. 1*, per pound	11¼c
" No. 2, " "	8¼c

NAILS.—The market is stiffening at the East and on this coast, with higher prices looked for.

Wire, carloads, basis per keg	
" jobbing, " "	$2 25
Cut, carloads, " "	
" jobbing, " "	2 10

SPELTER.—The market is fairly active both here and at the East.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The markets here and at the East are firmer.

PLATINUM.—Dealers report a fair inquiry. Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is steady at quotations. Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—There is nothing new to report. At the East prices are firm.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is steady to firm.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

There is a light movement from jobbers. The bad condition of interior roads is against much of a demand. As a rule, the markets here and at the East are firm.

BONEASH.—Manufacturers report a good movement.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is reported quiet but firm at 2½c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but steady at $1.70 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—The market is easier. Eastern advices state that the demand is slacker and market easier.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is quiet at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is light. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—The Eastern markets are easier. Our market is steady, but dull.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, March 11, 1897.

The market has been devoid of interest. The depression that has ruled since January 1st last still continues. It seems to be a growing belief that there will be no change of a permanent character for some time to come. This does not indicate a belief that there will be up moves, but there will not be prices worth outsiders venturing in the market to try and get. Those who contend that there will not be much of a deal for some time to come base their opinion on reports that large moneyed men are not personally interested in the game, and without them neither a good sized or a fair sized deal can be made. They state that probable suits at law by discontents are a prime factor in keeping them out. They also state that under present conditions they would not give support to the market even if ore should be found in a mine in paying quantities. The attempt was made to galvanize the market into life on reported ore strike in Con. Virginia has failed, for operators do not find that experienced miners, not stock gambling operators, place confidence in the reports. Aside from that, an assessment even has more weight than reports of a small vein of ore. Even with this drawback, they may find more ore than indications warrant in expecting, which may enable stock manipulators to advance the shares sufficient to make shorts fill and also sell a few hundred shares to outsiders who stand in need of being left on a deal proposition. It is the growing impression that after the Legislature adjourns, and with money easy, an attempt will be made to advance prices to carry out the usual spring deal proposition. Assessments continue to be levied, for it takes money to run mines.

Official letters filed at the different offices in this city do not report any material change since our last week's issue. Work is being pushed as rapidly as possible considering the small number of miners at work. Several of the companies have more bosses and attaches than miners, which helps to give employment and, incidentally, "eat up" assessment money. The Utah letter reports fair work on the same level and in the same direction heretofore reported. The east crossdrift in Sierra Nevada from the north drift on the Layton tunnel level has struck water. This is considered favorable. The face shows porphyry, with seams of clay. In Union work is continued on the west crossdrift, and also east crossdrift on the 900-foot level. The formation is practically unchanged. Mexican letter reports that the face of the west crossdrift, 1000-foot level, is in hard porphyry, showing clay seams and soft vein matter on the bottom. In Ophir work is continued on the 1000-foot level westward and southward on the Central tunnel level. The Con. Virginia letter states that work is being done on the 1750-foot, 1650-foot, 1550-foot and 1000-foot levels. So far the sanguine expectations of bull pointers have not been realized, for the ore in the workings from 1550-foot level have narrowed instead of widened. On the 1650-foot mine floor, the first floor above the sill floor, the ore vein is 3 feet wide. The ore raised last week from all workings aggregated 68 tons, assaying $50.90 a ton. A north drift has been started by Best & Belcher and Gould & Curry from the 800-foot Bonner shaft level. In Savage the usual work is reported. Now that the Hale & Norcross election is over, unless more wrangling over law points should set in, it is to be hoped that the superintendent will be allowed to prosecute work more energetically. No work is being done in Chollar. Work is continued by Potosi from the tunnel level. They found $5 ore in the mine and a 20-cent assessment in the office. In Bullion and Alpha the work is on the same levels and directions heretofore reported. The letters from Con. Imperial, Confidence and Challenge do not report any particular change. The long west crossdrift is expected to strike the west lode some time in next month. Nothing is allowed to leak out from Yellow Jacket. The Crown Point letter does not report any material change. Silence continues the order regarding ore developments in Belcher and Seg. Belcher. Some ore is still raised, but from what level and character of work the letters do not report. Overman raised last week a few tons of ore from the 900-foot level. It assays over $50 a ton. In Caledonia work is continued on the 1100-foot level. From Alta nothing new comes to hand.

From the Brunswick lode our advices are slightly more encouraging. In Occidental they are working on the 550-foot, 750-foot and 850-foot levels. On the first and last levels they have struck ore. On the 550-foot it is 5 feet wide, assaying over $5, and on the 850 it is 2 feet wide, assaying $25 gold. Chollar has resumed shipping ore. The official letter reports 106 tons sent to mill, assaying $36 gold and 21 ounces silver to the ton. Exploiting work is being prosecuted on the 200-foot, 300-

Assessment Notices.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of November, 1896, an assessment (No. 2), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on the 25th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 24th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 24th day of February, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on FRIDAY, the 26th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on FRIDAY, the 21st day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1) of five cents (5c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—210 Sansome street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

POSTPONEMENT.

At a meeting of the Board of Directors of the Mineral Hill Mining and Smelting Company, held on the 15th day of February, 1897, it was resolved that any stock upon which the assessment shall remain unpaid on the 15th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 13th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

CHAS. PEACH, Secretary.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the date of delinquency of the above assessment is postponed to the 10th day of March, 1897, and the day of sale to MONDAY, the 29th day of March, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 43) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

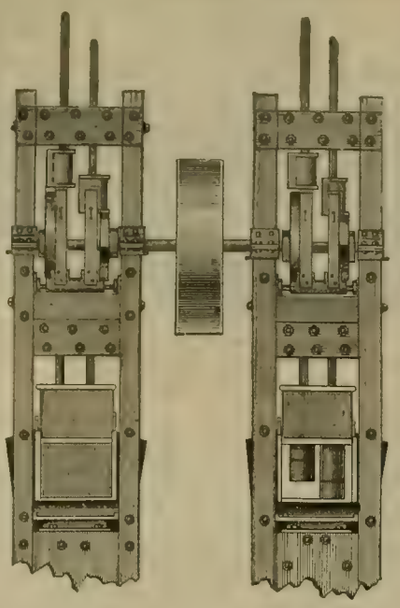
Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.



Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of February, 1897, an assessment (No. 26) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of March, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 6th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED E. DUREROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

KROGH M'F'G CO.

Successors to San Francisco Tool Co.'s MACHINE AND M'F'G DEPT.

Manufacturers of and Dealers in

Mining and Pumping Machinery,

COMPRISING

BRIGGS' 2-STAMP TRIPLE DISCHARGE QUARTZ MILL, of Latest Improved Pattern.

Rock Breakers, Ore Feeders, Concentrators, Engines and Boilers, Hoisting Rigs to be operated by Horse, Steam Power, or any other motor; Ore Cars and Ore Buckets, Cornish and Jack-head Pumps, Triple-Acting Pumps, Centrifugal Sand and Gravel Pumps, Wooden Tanks and Pumps for the Cyanide Process Pipe and Gate Valves, Link Chain Elevators for elevating and conveying all kinds of material.

Estimates as to cost of machinery and its erection furnished upon application. Write for Catalogue and Prices.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of March, 1897, an assessment (No. 8) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 47, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 3d day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 14th day of January, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Julius Winkler	29	250	25 00
G. F. Deetken	82	1,000	100 00
Julius Winkler	96	500	50 00
Mrs. G. F. Deetken	190	600	60 00
Fred Deetken	237	1,000	100 00
Mrs. G. F. Deetken	239	400	40 00

And in accordance with law, and an order from the Board of Directors, made on the 14th day of January, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 237 Twelfth street, San Francisco, California, on THURSDAY, the 8th day of April, 1897, at the hour of 5:30 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

F. METTMANN, Secretary.

Office—237 Twelfth street, San Francisco, California.

Assaying Gold

.....AND.....

Silver Ores.

A Standard Work.

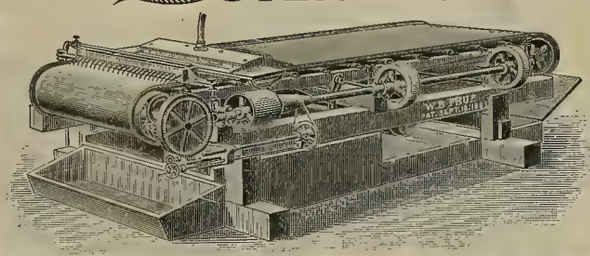
THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.



The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the ma ket that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.

RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Streets, San Francisco, Cal.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.
One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.
In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,
D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.
Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

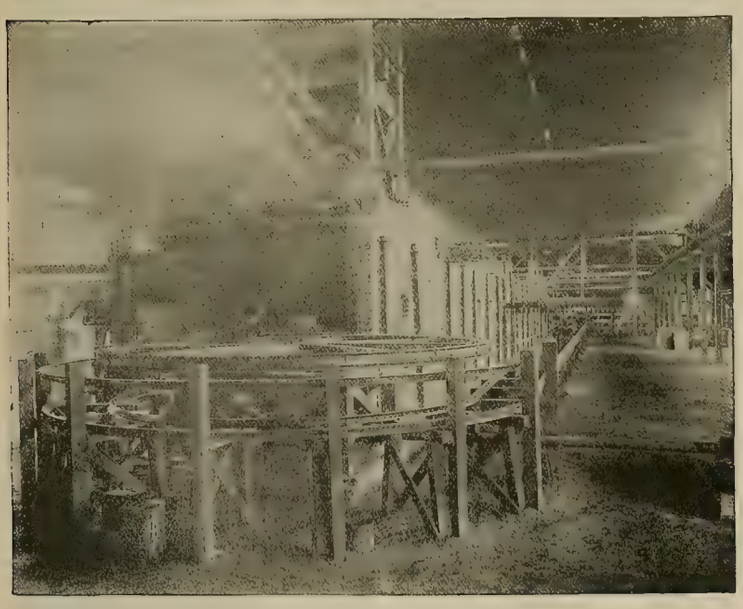
BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.
The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.
You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.
Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.



RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.
"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.
"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now is successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

CALIFORNIA STATE LIBRARY

Extravagance in Road Work.

Considerable has recently been said in these columns regarding the need of good roads in California. It is to be borne in mind that a large amount of money is annually expended for "road work" in the various counties—one man writes that in his county 45 per cent of the taxes collected are so expended—but it sometimes happens that that money is not wisely or judiciously spent.

Herewith is illustrated two striking instances of extravagance in road making. The lower picture shows a plank culvert which looks economical, but is really a tax-consuming device. Substructures of perishable material are always extravagant, though the first cost has an economical look on paper. They consume a large amount of timber and afford opportunity for a large amount of wage paying. Every time a plank gives out a whole lot of county machinery is set at work and the cost of repairs is enormous. A case has been cited in which a man and team were sent to put a plank in a bridge a few miles distant. He started out leisurely in the morning, got a plank from a lumber yard and proceeded to the broken bridge four or five miles away. Arriving about lunch time, he ate his lunch and then unloaded the plank. He found that he had bought a 12-inch plank instead of a 10-inch, and was forced to leave the misfit plank in the gap and return to town. As it was too late in the day to return he unhitched and turned in for the night. The next morning he went again to the lumber yard and got a plank of the right width and started again for the broken bridge. Arriving there he found that some one had stolen the loose plank which he left in the gap, but he succeeded in nailing down the new one and got back to town that night. When the bill came in against the county it of course included the cost of two planks and two days' time of man and team to put one plank in a bridge—a job which should have been done in half a day. All perishable substructures are likely be very expensive in this way, and that is the reason why permanent, imperishable structures are so cheap in the end. The plank culvert shown in the engraving will require constant patching and renewal, and will therefore in a few years cost many times as much as a cement and glazed sewer-pipe culvert would.

INSTANCE OF MONEY WASTED IN BUILDING MAKESHFIT ROADS.

The upper picture on this page is just as eloquent in its way. It represents the construction of a roadway over a lava plain in Tehama county. The plan has been to roll the rocks to one side and thus clear a way, but the material beneath was of such nature that the roadway soon became dangerous and almost impassable. Five times, therefore, new roads were arranged to take the place of those worn out, and the picture shows four of these abandoned roadways Last year, on advice of the Bureau of Highways, the people undertook to build a macadamized road of the rock which lay all around. There was no public money available, so one man advanced the money to buy a rock crusher, the neighbors subscribed 1000 days' labor of themselves and teams, others subscribed food and provender for man and beast while the work was in progress, and the result is the macadamized road of which a portion is shown at the extreme right of the picture. It has cost less than did the five worn-out roads and it will last for a lifetime with a little care and watchfulness. It was a hard place to build a road, for there was no soil into which excavation could be made to hold the broken rock in place, but by piling up the loose rocks on each side, and making a crushed rock roadway between these retaining lines of large rock, the difficulty has been overcome. This, too, shows how a good job will be a permanent improvement and thus enter into the actual wealth and resources of the county, while a poor road is not only expensive but but represents no investment at all, because it has no durability or permanence in it.

ILLUSTRATIONS.—Instance of Money Wasted in Building Makeshift Roads; Type of Culvert Which Is of Endless Expense to the County, 229. Works of Arkansas Valley Smelting Co., Leadville, Colo., 235. The "Daniel Best" Crude Oil Engine, 240. Hercules Gas Engine, 242.

EDITORIAL.—Extravagance in Road Work, 229. California School Lands; The Forest Reservations; The Debris and Dredger Bills; The New Law as to Locations, 230.

SCIENTIFIC PROGRESS.—An Improved Pyrometer; A New Process for the Protection of Iron Structures; An Unnecessary Change; Envelopes Lined with Tinfoil; Aluminum, 236.

ELECTRICAL PROGRESS.—Electricity from Carbon Without Heat; Carbons for Electrolysis; High Electric Voltages; Magnetized Watches, 237.

MECHANICAL PROGRESS.—A Novel Use of Cast Iron; Why American Machinery Leads; Projectiles of Steel; An All-Round-the-World Route; Largest Locomotives Ever Constructed; American and German Railroads Compared; Large Steamers; Steel Rails for the German Pacific, 237.

PRACTICAL INFORMATION.—Reckoning Time Simplified; A New Metal; Cutting of Ice in Wisconsin; Prominent Feature of the Metal Market; A Water-Tube Jail; A New Expedition; The Missouri's Source; Earliest Discovery of Iron; Good Sponges; A Prize for the Swiftest Bird, 237.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 238-9.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 250.

MISCELLANEOUS.—Concentrates, 231. Outline of the Geology of California with Reference to Its Mineral Deposits; Bolivian Mines, 232. The Yukon, Alaska, Mines; Characteristics of the El Dorado Gold Belt; Electric vs. Water Power, 233. The Spitzkasten and Settling Tank, 234. The Consolidated Kansas City Smelting and Refining Company; Report of Commissioner of Patents; Costs of the Past and the Present; Alabama Mineral Products, 235. The "Daniel Best" Crude Oil Engine, 240. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations; Hercules Gas Engine; Recently Declared Mining Dividends, 242. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 247.

The Debris and Dredger Bills.

The debris and dredger bills have been passed by the Legislature of California and signed by the Governor. There was, of course, no expectation that the debris bill would fail of passage, for it was designed merely to correct the bill by which $250,000 was appropriated in 1892, to be expended in conjunction with another $250,000 appropriated by Congress for building restraining dams under the direction of the United States engineers. That this money will be wisely and well spent there can be little doubt, simply because the direction of the works to be undertaken is put almost entirely in the hands of the United States Debris Commissioners. The California Legislature has never made a wiser investment than this. Had Congress not been induced to make its appropriation, and had the State's $250,000 been expended under the direction of Commissioners appointed by the Governor, with an eye to the good of his party or his own political future, little good would probably have been done. As it is, no matter what appointments may be made by the Governor or how much it is attempted to do politics with the money appropriated, the United States engineers will go on and expend it in a business-like way. There will be no scandals connected with the debris appropriations.

The dredger bill as first passed by the Senate and Assembly provided for the expenditure of $300,000 in dredging and straightening the channel of the Sacramento river. The amount, properly expended, would not be more than would be required for the good work that could be done in two years. However, the Governor, desirous of making a name for economy, called into conference the champions of the measure and forced them to accept a modified bill, by which the first year's levy should be only one-quarter of a cent—making about $30,000, and the second year's only one-half a cent—amounting to $60,000, leaving the rest of the appropriation to be collected thereafter.

It was suggested in the MINING AND SCIENTIFIC PRESS early in the session that, upon proper presentation of the case, Congress could easily be induced to make an appropriation for improving the Sacramento at least equal to that made by the State to be expended at the same time. As it is, it will now be at least a year before the State can do much or expend a large part of the money intended for the purpose, and it is to be hoped that at the next session of Congress some steps will be taken to induce the Federal government to join in the work. The opening of the Sacramento river to navigation and its preservation for that purpose is not the province of the State, but of the Federal government. Yet, as was said in these columns a few months ago, the expenditure of money by the State on the river will probably be a good investment, in that it will induce the Federal government to do much more than it would otherwise.

It is to be hoped, too, that the Federal government will come in before any large proportion of the amount intended to be expended by the dredger bill is paid out. That in the end most of the work of improving the Sacramento river will be done by the Federal government there can be no question, and it will be much better if what has been appropriated by the State be expended in such manner as to be of value and in accordance with the views of United States engineers. Otherwise it is apt to be wasted.

The New Law as to Locations.

The new mining law as to locating upon the public domain, which has passed the Legislature of California, contains some desirable provisions, but is in other respects far short of what is wanted. Its provisions are as follows:

The discoverer of any vein or lode shall immediately, upon making a discovery, erect at the point of discovery a substantial monument, or mound of rocks, and post thereon a preliminary notice which shall contain the name of the lode or claim; the name of the locator or locators; the date of discovery; the length, width and general course of the vein, and a statement that the notice is a first or preliminary notice. Such notice shall be recorded in the office of the County Recorder of the county in which the same is posted within twenty days after the posting thereof. Upon the erection of said monument and posting such notice, the discoverer shall be allowed the period of time specified in Section 3 of this Act to enable him to perfect his location as hereinafter provided.

SEC. 3. Within sixty days from the date of the discovery of a vein or lode, the discoverer must perform fifty dollars' worth of labor in developing his discovery, and mark his location on the ground so that its boundaries can be readily traced, and must file in the office of the County Recorder of the county in which the claim is situated a certificate of location, which said certificate shall state:

1. The name of the lode or claim.
2. The name of the locator or locators.
3. The date of discovery and posting of notice, provided for in Section 2 of this act, which shall be considered as the date of the location.
4. A description of the claim, defining the exterior boundaries as they are marked upon the ground, and such additional description by reference to some natural objects, or permanent monument, as will identify the claim.
5. A statement that such certificate is final or completed notice of location, and that he has performed the aforesaid fifty dollars' worth of labor in development work thereon within the aforesaid sixty-day period, stating generally the nature thereof. Said certificate shall be dated and signed by or on behalf of the locator or locators, and verified by them or by some one in their behalf, and when filed for record shall be deemed and considered as prima facie evidence of the facts therein recited. A copy of such certificate of location, certified by the County Recorder, shall be admitted in evidence in all actions or proceedings with the same effect as the original. The performance of such labor shall be deemed a necessary act in completing such location and a part thereof, and no part thereof shall inure to the benefit of any subsequent location.

SEC. 4. The discoverer of placers or other forms of deposit, subject to location and appropriation under mining laws applicable to placers, shall locate his claim in the following manner:

First—He must immediately post in a conspicuous place at the point of discovery thereon a notice or certificate of location thereof containing:

(*a*) The name of the claim.

(*b*) The name of the locator or locators.

(*c*) The date of discovery and posting of the notice, hereinbefore provided for, which shall be considered as the date of the location.

(*d*) A description of the claim by reference to legal subdivisions of sections, if the location is made in conformity with the public surveys; otherwise, a description with reference to some natural object or permanent monument as will identify the claim, and where such claim is located by legal subdivisions of the public surveys such location shall, notwithstanding that fact, be marked by the locator upon the ground, the same as other locations.

Second—Within thirty days from the date of such discovery he must record such notice or certificate of location in the office of the County Recorder of the county in which such discovery is made, and so distinctly mark his location on the ground that its boundaries can be readily traced.

Third—Within sixty days from the date of the discovery the discoverer shall perform labor upon such location or claim in developing the same to an amount which shall be equivalent in the aggregate to at least ten dollars' ($10) worth of such labor for each twenty acres, or fractional part thereof, contained in such location or claim.

A failure to perform such labor within said time shall cause all rights under such location to be forfeited, and the land discovered thereby shall at once be open to location by qualified locators other than the preceding locators, but shall not in any event be open to location by such preceding locators, and any labor performed by them thereon shall not inure to the benefit of any subsequent locator thereof.

Fifth—Such locator shall, upon the performance of such labor, file with the recorder of the county an affidavit showing such performance, and generally the nature and kind of work so done.

SEC. 5. The affidavit provided for in the last section, and the aforesaid placer notice or certificate of location when filed for location, shall be deemed and considered as *prima facie* evidence of the facts therein recited. A copy of such certificate, notice or affidavit, certified by the County Recorder, shall be admitted in evidence in all actions or proceedings with the same effect as the original.

SEC. 6. All locations of quartz or placer formations or deposits, hereafter made, which do not conform to the requirements of this act, in so far as the same are respectively applicable thereto shall be void.

SEC. 7. No record of a mining claim or mill site made after the passage of this act, in the records of any mining district, shall be valid. All notices of location of mining claims, mill sites, and other notices, heretofore recorded in such district records, if such notices conform to the local rules and regulations in force in such district, are hereby declared valid. Within thirty days after the passage of this act the District Recorder or custodian of the records of the several mining districts in this State, shall transmit to the County Recorders of the respective counties wherein the respective districts are situated, all the records of said respective districts, and thenceforward such County Recorder shall be deemed and considered the legal custodian of such records. Thereafter copies of such records, certified by the County Recorder, may be received in evidence with the same effect as the originals.

The two things most needed in the mining law of this State were some definition as to what shall constitute a proper marking and some provision for preventing people from evading the spirit of the United States statute requiring assessment work to be done and so holding claims without doing anything to develop them. As to this last, the bill makes full provision, but as to what shall constitute a proper marking the bill is silent, and those who wish to locate mines will still be as much in the dark as ever as to what monuments they shall erect, and this fruitful source of litigation will still remain.

California School Lands.

Very late in the session of the California Legislature Senator Stratton introduced a bill providing for the repeal of the acts of March 28, 1874, February 3, 1876, and April 6, 1880, providing for the sale of mineral land in school sections 16 and 36, granted to the State by the Federal government. In spite of the short time allowed and the opposition that was brought to bear by parties in interest, the bill has been passed and has gone to the Governor for his signature.

This will be of particular interest to people in the Rand district in Kern county, from which place less than nineteen applications for patents for forty acres each have been filed with the Attorney General under the acts referred to, and which have been declared by the United States Supreme Court void.

THERE is being mooted the question whether or not mineral claims may be located within the boundaries of the forest reserves, recently set apart by presidential proclamation. If they may, or if it is the desire of the Government that this shall be allowed, the question should be speedily settled by Congressional enactment at this special session. A delay can only lead to confusion, and the miners are already overburdened with that in respect to the laws.

Concentrates.

ROSSLAND, B. C., proposes to organize a mining exchange.

MERCUR, UTAH, will be lighted with electricity by the first of May.

THE shipments from Bingham, Utah, in February amounted to 3952 tons of ore.

LUMBER costs $142 a thousand at the mines near Coolgardie, Western Australia.

A COMPANY has been formed to work the mica mines in Latah county, Idaho.

THE new owners of the Edna mine in Calaveras county, Cal., propose to erect a four-stamp mill.

IT is announced that metallic tin has been discovered near the north fork of the Salmon river in British Columbia.

AT the Dead Horse mine in Tuolumne county, California, the shaft, which is 1500 feet deep, is to be sunk another 500.

IT is proposed by some Alaskans to drive 200 head of cattle overland from Seattle, Wash., into the Yukon country by the Dalton trail and Chilkat pass.

THE Good Will tunnel, at Cripple Creek, Colo., which is in a distance of over 800 feet, was cut 318 feet in 28 days in February, an average of 11.35 feet a day.

THE London & Cripple Creek Company has completed its cyanide plant at Florence, Colorado, at an expense of $100,000, and is working in Cripple Creek ores.

THERE were thirty-nine claims recorded in the office of the Recorder of the Rand mining district, in Kern county, California, for the week ending March 12.

AT Marcus, Idaho, the owners of the Sunnyside group of mines have incorporated their properties and will soon start a tunnel 3000 feet in length to tap their claims.

A WORKMAN in digging a cellar at Salmo, on the Salmon river in British Columbia, last week, found a $10-nugget, and over 100 claims have been staked out since then.

THE bill introduced by Assemblyman Robinson of Nevada providing for the appointment of a State mining inspector has passed both houses of the California legislature.

THE mines of the United States of Colombia have, it is estimated, yielded in gold since the emancipation from Spain $700,000,000. Nearly every state and province has its gold deposits.

TWO MINING operators from Australia came over in the Miowera on her last trip, bound for the British Columbia mines, and state that many other miners are preparing to come over.

THE Mica Manufacturing Company, limited, is being floated in London at £80,000. It is formed to acquire and work the Lake Girard group of mica mines, consisting of 1700 acres, in Ontario, Canada.

IN Siskiyou Co., Cal., it is claimed that there is at least a third more mining done this season than there was last. A good supply of water promised for the gravel mines will add much to the total output.

CAPTAIN HALL, superintendent of the Le Roi mine at Rossland, B. C., states that when the new hoisting apparatus is in and the compressor drills all started he will be able to get out 1000 tons of ore a day.

THE Union Colliery Company, of Comox, B. C., has entered into contract with the Kootenay smelting companies to supply 1000 tons of Union coke per month for the next twelve months, and this amount may be increased.

THE Maltman & Thompson chlorination works at Grass Valley, Cal., were burned last Saturday morning. They were built in '87 and operated successfully until twelve months ago. The loss is estimated at $12,000.

THE people of Forest City, Sierra county, propose to buy the electric plant lately used by the Bald Mountain Extension Company to illuminate the town. Downieville and Sierra City are already supplied with electric light.

UP to March 6, the total value of ore and matte shipped from the Kootenay country since the first of the year was $1,658,400.05. The total for the week ending March 6 was $261,224.80. This all shows a large increase over last year.

THERE is not a county in the State of Wyoming that is not underlaid with coal to a greater or less extent. In this industry over 4000 men are employed, producing annually 2,500,000 tons of coal, valued at the mine at over $4,000,000.

THE De Lamar mine in Lincoln county, Nevada, has been started up again, the men and the management having arrived at an understanding by which there will be no danger of strikes. The output of the mine is nearly 300 tons daily.

THE February cleanup of the Alaska-Treadwell G. M. Co., Alaska, resulted as follows: Bullion shipment, $38,189; ore milled, 19,154 tons; sulphurets treated, 430 tons; bullion from sulphurets, $13.353; average cost of the bullion was $1.99 per ton of ore milled.

A CONTRACT for machinery castings and for a 200-stamp mill to be erected by the Union Hill Mining Company in Galena, South Dakota, has been awarded. This new company has on its pay roll 200 men, and their proposed work promises to add much to the output of the Black Hills.

THERE is considerable excitement in Ventura County, California, over a gold discovery made in Ojai valley. Hundreds of locations have been made, and the mountains are full of prospectors. The discovery as reported is of a ledge carrying comparatively low-grade ore.

DOUGLAS J. NEAME, of London, England, has obtained options on the Commander, Jumbo and Gertrude mines, at Rossland, British Columbia, the prices aggregating $875,000, of which $250,000 is for the Commander, $500,000 for the Jumbo, and $125,000 for the Gertrude.

THE Toronto *World* states that the Gooderham-Blackstock syndicate, which lately bought the War Eagle mine in British Columbia for about $800,000, had an offer from a London syndicate of $2,475,000. It is more likely that the London promoters offer about $1,000,000 and reserve the balance of $1,475,000 to pay for promoting.

THE Boston & Montana Consolidated Copper and Silver Mining Company, of Montana, has begun an action in the United States court to recover half a million dollars from the Montana Ore Purchasing Company, E. Augustus Heinze and A. P. Heinze, the alleged value of ores extracted from the Pennsylvania by the defendants.

DURING the month of February there were shipped from the Black Hawk depot, in Colorado, 287 cars of mineral, representing the product of the district for that month, aggregating 4592 tons. Compared with the corresponding month of 1896 this shows an increased shipment of 102 cars, or 1632 tons of mineral, or an increase of over 50 per cent.

THE Leadville strike has been declared off by the miners. The struggle has been a long and hard one and has entailed heavy losses on all concerned. It is claimed that the loss to the camp has been no less than $4,000,000, and the maintenance of the troops has added much to the taxation of the State.

THE Governor of California has signed Assemblyman Seward's bill providing that unoccupied town lots in Government townsites shall be open to mineral claims, and the same member's bill permitting claims without acknowledgment or certificate of acknowledgment, and validating all notices heretofore filed without such.

THE Legislature of the State of Washington has lately passed bills to prevent the defacement, mutilation or destruction of miners' location stakes or notices and providing penalty clause; extending the right of eminent domain to mining and milling companies; appointing an inspector of coal mines for the protection of coal miners.

THE Canadian Pacific Railway, in its annual report, announces that the building of the Crow's Nest Pass line will be proceeded with as soon as weather will permit, whether assistance is received from the Canadian Government or not. This will do British Columbia mining districts much good in increasing facilities for shipping.

IN the John Day country there is considerable activity in placer mining. Ditches built as far back as 1862 have been opened, and old claims are being once more profitably worked. Many of these are being worked with the various patterns of gold-saving machines, with good results. Considerable capital is going in, and several mines are to be fitted up on large scales.

THE appropriation bill passed by Congress provides for $15,000 for continuing explorations of the waters of Alaska and making hydrographic surveys, including survey of the Alautian islands and examination of the mouth of the Yukon river, and for the establishment of latitude, longitude and magnetic stations. Also, $5000 for continuation of the investigation of the coal and gold resources of Alaska.

JULIAN SONNTAG has tendered to President Neff his resignation as secretary of the California Miners' Association. Mr. Sonntag has done good work during the past winter in connection with the mining legislation at Sacramento, and finds that too much of his time has been taken from his own business. Since he accepted the position, about eighteen months ago, Mr. Sonntag has never accepted the salary of $50 a month attached to the office.

THE Nevada Legislature has passed an act providing that all State deeds or patents to lands shall contain a provision expressly reserving all mines that may exist in such land, and the State disclaims any interest in mineral lands selected by the State on account of any grant from the United States. This act is to prevent all controversy regarding the title to mining claims discovered upon lands selected by the State and disposed of to settlers or speculators.

THE ancient Athenians who smelted galena at Laurium did not trouble themselves about the lead contents of their slags, and, consequently, at the present date it pays to smelt them. Some of these slags, rich in lead, have been exposed to the action of sea water, and from the resulting decomposition some new crystalline lead compounds have been formed. According to A. Lacroix, these crystals are sometimes of considerable size, and consist of laurionite, penfieldite, matlockite, cerussite, hydro-cerussite and anglesite.

A NEW company will begin work about May first on the proposed Pandora tunnel, to run from Pandora to the Telluride mine in Colorado, a distance of 7000 feet. It will cut the southeast extension of the Smuggler-Union vein, the Columbia-Menona and Bradley and Pioneer, Eight-five, Argentine and Big Elephant, Japan, Flora, Climax, and finally the Big Elephant. All these leads will be cut at a depth of from 2000 to 3000 feet below the surface.

AT the Zelnora mine at Bingham, Utah, they are testing water seeping from one of the copper veins in the main canyon with the purpose, if results are favorable, of establishing a precipitating plant. Several years ago Prof. Hirsching of Salt Lake estimated that two tons of copper are carried away by the water of Bingham creek every twenty-four hours, and that a process might be operated which would precipitate the metal at the nominal expense of $2.50 a ton.

THE first sluice box ever operated in Alaska is claimed to have been one put in by Duncan McKinnon at Shuck in 1870. The boxes were carried about a mile and a half from the beach by Indians at an expense to Mr. McKinnon of $17, and were very crudely put into position and charged with quicksilver and shoveled full of dirt on which the water was then turned, the process being continued for three days. A clean-up at the end of that time yielded a button weighing $7.50.

THE Douglas mill and reduction works, at Dayton, Nevada, have been leased by the Peck Brothers, who, as heretofore announced, have purchased the Douglas ore tailings deposit east of the mouth of Six-mile canyon. The Peck process will be adopted in working them. The deposit contains over 500,000 tons which it is claimed show an average assay value of $7. The narrow-gauge road from Dayton to the deposit will be repaired, and it is claimed that 500 tons a day will be worked.

IN the Camp Floyd mining district, Utah, there will in all probability be five large mills erected as soon as the weather will permit. These will be in the Gold Dust, Brickyard, Overland, La Cigale and Daisy properties. It is also probable that a large mill will be erected this year on the Golden Gate, and at Mercur the plants at the Mercur, Marion and Geyser will be enlarged. Besides this, the mill at the Sunshine will be started up, and it is probable that the output of the camp will be nearly doubled.

IT is reported from Boston, Mass., that a German syndicate has invested some $20,000,000 in Montana copper mine stocks and secured control of some of the largest mines, including the Boston & Montana and Butte & Boston mines. Then the Boston News Bureau says that the Rothschilds are trying to buy the Calumet & Hecla, the Tamarack, Butte & Boston and Boston & Montana properties, and corroborates the story which has been going the rounds of the press to the effect that Butte & Boston stock amounting to $1,800,000 has been transferred to foreigners.

SECRETARY JULIAN SONNTAG states that the treasury of the California Miners' Association is empty, and asks that the various county organizations now far behind in their dues come forward. While there is no need for much money for present expenses, there is money due for the expenses of the past winter, which have necessarily been heavy. The good work of the Association should not be hampered for want of the comparatively small sums due from the branch organizations.

THE New Mexico Miners' Association was organized last week at Santa Fe. The by-laws and constitution of the California Miners' Association were adopted. Antonio Joseph of Taos and F. A. Geynolds of Chloride were elected president and secretary, respectively. It was stated that the object is to unite mine owners and capitalists interested in New Mexico against the Western Federation of Miners, which has so long flourished at Leadville, Cripple Creek and other camps in Colorado.

A MEETING of the shareholders of the Banner Gold Mine, whose properties are in Butte county, California, was held in London on February 24, to reconstitute the company. The chairman explained that it was proposed to amalgamate the Long's Bar Gold Mine, Clark Gold Mine, Coffee Gold Mine, and the Hedge's Gold Placer and Quartz Mine with the Banner and Amvaky Mine under the name of the Consolidated Gold Mines of California. The shares in the new company would be issued with a liability of 3s. The scheme was adopted.

NEW YORK people have purchased for $80,000 gravel property in Wyoming, consisting of 1920 acres of placer ground, which averages from 3 to 5 feet in depth. This gravel is a lacustrine deposit from granite and very easy to wash, containing very few boulders, and those small in size. The gold, however, is very fine in all that country in southern Wyoming and northwestern Colorado, averaging in many deposits 1000 nuggets to 1 cent. However, it is not flaky, but in the shape of small nuggets, and comparatively easy to save with proper appliances.

THE Pioche *Record*, in speaking of the old Ely district, says that there are as good opportunities there now for mining as ever. While the ore is not of as high grade as formerly, the prices and costs of working have been reduced enough to give a greater profit. The paper says: "The charges of hauling from the mines to the railroad have fallen a trifle lower than 60 per cent of what they were at the time this district was flourishing, while the charges on the railroad to the smelters have been reduced to a trifle less than one-half, and the smelting charges have fallen or been reduced in a like proportion."

AT the first meeting of the Board of Trustees of the American Flat Company at Virginia City last week, after the election of officers, W. E. Sharon, H. M. Gorham and E. D. Doyle were appointed a committee to negotiate an agreement with the Comstock Tunnel Company for the purpose of securing their assistance in constructing a tunnel from the shaft of the Alta Mining Company, to drain the Comstock lode, connecting with the tunnel from the Alta shaft to the Sutro tunnel at the Foreman shaft, and A. Lackey, E. D. Boyle and J. R. Ryan a committee to negotiate with owners of claims upon the Comstock lode for the conveyance of undivided portions of such claims to the company.

IN the Cœur d'Alene country, at the Bunker Hill and Sullivan property, they will soon continue the big tunnel which was commenced in 1890 by D. A. Clement, who was the manager of the property. It had been run between 500 and 600 feet at the time of the troubles in that section, and the work has not been continued since that time. This will be the greatest work in the district, and the tunnel when completed will be one and a half miles long, and at one mile will tap the big vein running through that section, and will drain all the mines between Kellogg and the Tyler. John Hays Hammond, who retains his interests in the properties, is expected to come out to the mines on his return from South Africa.

AT the examination of Cecil Rhodes by the parliamentary committee appointed to enquire into the Jameson raid into the Transvaal, it appeared that the fines imposed upon the members of the Reform Committee were in part paid by him. Mr. Rhodes stated that he had sold 40,000 shares of the South Africa Company stock to pay the expenses of the war against the Matabeles, and had expended £94,000 in that. He further testified that he had paid £50,000 toward the fines which had been imposed by the Transvaal court at Pretoria upon the Johannesburg reform committee prisoners. The questions put and answers given showed that the narrow and reactionary policy of the Transvaal Government is endangering the peace of South Africa.

FROM the Slocan mines, owned by Farrell, Yawkey and Humphreys, the Idaho, Alamo, Cumberland and the Minnesota Silver, of the Ivanhoe group, the smelter returns up to January 1 of the present year show that the Idaho has produced ore to the value of $236,000; the Alamo, $186,000; the Cumberland, $12,000; and the Minnesota Silver, $42,000—a total of $476,000. The general average of crude ore and concentrates from the Idaho during the life of the mine has been 152 ounces of silver and 50 per cent lead. The highest smelter returns from any ore shipment was 636 ounces of silver. The average concentration of the different properties is as follows: Idaho, 4 tons to 1; Alamo, 3.8 tons to 1; Cumberland, 3.9 tons to 1.

THE powder war has been brought to a close by an arrangement between the Atlantic and Pacific coast companies. The Eastern companies are to keep out of the coast field and vice versa, but between the two is a neutral ground including New Mexico, Colorado, Montana, Utah and Wyoming. It is open to both parties, who have agreed to advance prices from 1 cent to 1½ cents on both black powder and high explosives. The California, Judson and Giant companies have an agreement as to their territory—Washington, Oregon, California, Nevada, Arizona and Idaho—in which the advances will be higher than in the neutral belt, and will be about 2 cents a pound. It is understood that a powder factory will be started in Denver, Colorado.

THERE has been passed over the Governor's veto in Utah a new mining bill as to locations and titles to mining claims. The main objection to the bill was that it provided that all locations must be recorded with the county recorder, as well as the district recorder, thus practically doing away with the necessity for the district recorders. In other respects the bill is practically the same as that proposed for adoption by the California Legislature in the MINING AND SCIENTIFIC PRESS of October 31, 1896. As to marking boundaries, it prescribes that on a location of a quartz claim there must be erected in each corner thereof, and at any angle in the side line, a monument marked with the name of the claim and the corner or angle it represents.

Outline of the Geology of California with Reference to Its Mineral Deposits.

NUMBER VI.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS, Ph. D

The important event of economic importance in the Coast ranges connected with the volcanic eruptions was the inauguration of the flow of numerous hot springs impregnated with silica, sulphur, cinnabar and occasionally gold. The cinnabar deposits are among the most important of the mineral resources of the State. They are traceable directly to the volcanic disturbances mentioned. Cinnabar is one of the most recently formed minerals. In several places, as Sulphur Bank and Colusa Creek, the deposition is still taking place. These two localities are worthy of the closest study by those interested in the conditions of mineral deposition. The hot—almost boiling—waters are still depositing cinnabar, sulphur and gold at Colusa Creek, and the underground workings of some of the mines here, which are almost unbearably hot, illustrate so finely the conditions under which many minerals are formed that a visit to them is most profitable and instructive. At the Sulphur Bank there are good illustrations of the manner in which hot mineral waters decompose and remove solid rock, partially substituting the minerals originally held in solution.

As cinnabar is still being formed, it follows that deposits of this mineral may be looked for in any and all of the rocks in the quicksilver belt. Large masses of red croppings are widely disseminated through the gold belt, going by the name of "quicksilver rock." They are the result of the same mineralizing action as the workable deposits, but in many cases do not contain the mineral in noticeable amount. In superficial appearance they are somewhat similar to the great red croppings along the mother lode, consisting of the carbonates of lime, iron and magnesia in a skeleton work of opaline silica. The gangue of the mother lode often contains maraposite, while its silica is crystalline. Quicksilver deposits are found from Santa Barbara county on the south to Siskiyou county, and at a few places in small amount in El Dorado and Tuolumne counties.

Since the quicksilver ores have been formed so recently, very little erosion of the surface portions has taken place. Nevertheless, the deposits have not been found to extend to as great depth as those of some other minerals. Below 1500 feet, or even at much less depths, they begin to show signs of giving out. In the case of gold, on the contrary, we have no adequate means of measuring the depths reached by the veins, for thousands of feet of the surface have been removed by erosion. The deepest mines on the mother lode do not appear to have reached poorer rock. There is an exception, however, to be noted in the case of the gold veins at Bodie, where it appears that the conditions of deposition were more nearly like those of cinnabar. There the veins have been found to be profitable to a depth of only 700 feet, and in places much less. The Bodie veins have the appearance of having been formed in more or less open fissures, a condition which does not seem to have prevailed during the post-Jurassic period of gold deposition.

The few gold veins found in the Cretaceous rocks at Colusa Creek are more curiosities than anything else, although some gold has been taken from them. In one mine gold is associated most intimately with cinnabar, while in others it is found in quartz which occurs lining open fissures through which hot waters once flowed.

Just why the deposits following a certain disturbance should be quicksilver in one region and silver or gold in another it is difficult to say. It may be due to different conditions of precipitation or, more likely, to the solvent power which different kinds of solutions possess in their actions upon the minerals disseminated through the rocks.

There are many other less important minerals, the geology of whose occurrence has not been fully investigated. Among these might be mentioned the iron ores, antimony, ochres, etc.

The variety, quality and accessibility of our building stones are, with few exceptions, unknown. Granite, marble and sandstone are abundant in nearly all parts of the State. In examining them for economic purposes we must take into account the geological conditions to which they have been subjected. In a country where mineralization is so widespread it is not to be wondered at that iron pyrites is so often met in rocks which otherwise would be good for building purposes. The great trouble with the many excellent building stones found in the Coast ranges is the fact that they have been so fractured in the oft-repeated mountain-making movements that large pieces free from flaws are difficult to obtain. The younger rocks, if coherent enough, are more apt to be free from such imperfections. The great bodies of granite and marble in these mountains are very often rendered totally unfit for building purposes on account of the crushing to which they have been subjected.

The recent geological history of California is, perhaps, as interesting as any and can be more easily understood. The most important of the events of early Quaternary times was the glaciation of the Sierra Nevadas. Although this has been greatly exaggerated, it was, nevertheless, an important event. Opinions differ as to whether glaciation in the Sierra Nevadas occurred at the same time that great ice sheet covered the Eastern and Northern States. The cause of the ice period is now more generally attributed to the elevation of land areas, and with this view it is not necessary to consider that glaciation took place here at the same time as in other regions. It seems, also, that the glaciers did not reach lower than an elevation of 5000 feet, and many phenomena attributed by uncritical observers to ice, not only in the Sierras but Coast ranges, have really no relation to it. In the great basin area of Nevada the glaciation of the Sierras was the time of the large and numerous lakes, chief among which was Lahontan. It is probable, also, that at about the same time the coast of California was more elevated than at present, and that the Santa Barbara islands were connected with the mainland.

As a result of the increased elevation and snow the country became colder and the great mammals of this period, the elephant and mammoth, wandered over California, as we know by the bones frequently found. It is quite possible that man shared the country with them, or even came at an earlier date. Russell found a flint implement in the clays of glacial Lake Lahontan, and there seems to be good evidence that human implements and remains have been obtained from the auriferous gravels underneath the lava flows.

The great lakes which existed in Nevada and eastern California have mostly dried up, and from their former beds we obtain soda, borax and other minerals. These alkali and borax flats are situated in the lowest portions of many of the depressions where the water last stood and occasionally appears in the present period. From the borders of these flats slope back for many miles the desert gravels and boulder-covered slopes leading to the mountain canyons.

The minerals found on the flats were probably gradually leached from the decomposing rocks surrounding the basins; springs also may have furnished some material. The streams emptying into these basins having no outlet gradually enriched them, until, upon the drying up of the waters, the minerals held in solution were left mingled with the clay sediments.

Since the great lava floods of northern California were formed volcanic action has gradually been decreasing, and within the bounds of the State there is no record of any lava flow having taken place for about the space of 200 years. This last flow was in the Lassen's peak region. The larger portion of the lavas found in the State have not flowed out of volcanic cones but from fissures. Volcanic cones are among the last products of an eruptive period, as a general thing. Because volcanic activity is quiescent in California at the present time, it is no indication that it has permanently ceased. Earthquakes indicate that movements of the crust are still taking place, and no one can tell when these movements will become violent enough to be accompanied by lava eruptions.

We must become used to the idea that the geological processes are going on to-day as they always have. Slow changes of level of the coast are taking place. It is possible that in comparatively recent times the Sacramento river flowed down through the Santa Clara valley to the bay of Monterey, instead of out through the Golden Gate. Before the recent subsidence about the bay of San Francisco took place, the Farallones were probably a part of the mainland, for an elevation now of 180 feet would connect them with it.

The problems of geology have to deal in an economic way with many other things than the occurrence of minerals. The character of the soil, and the water supply, are largely dependent upon geologic conditions. The soil varies with the chemical character of the rocks, except in valleys where it is made up of the wash from the adjacent mountain slopes. The character of the soil from different kinds of rocks is well illustrated by dikes of serpentine, which, if they extend through a wooded, hilly country can be easily traced by the lack of plant and tree growth.

The rainfall varies enormously in different parts of California, but this is not by any means the only condition governing the available water supply of any particular section. Those areas covered by lava flows are characteristically devoid of springs, because the more or less porous condition of the rock permits the water to flow beneath the surface, where it is generally inaccessible unless the country is cut by canyons, which permits it to emerge. This condition of things is particularly characteristic of northeastern California and, to a less extent, of volcanic areas in other portions. Even where the rainfall is light, water can be obtained if the underground conditions are favorable. Most of the wells put down even by professionals are located without any regard to the demands of geologic structure. These simple problems in practical geology ought to be better understood, for a little knowledge will often enable one to determine with some degree of accuracy the best place to search for water. There are large portions of the State where the possibility of tapping underground waters is of the highest importance. There are areas where it is not practical to collect surface waters in reservoirs, and in many of these a knowledge of the geology of the district will solve the problem.

Geology teaches another important thing in regard to those regions where the rainfall is fitful, and where, when it does come, it is torrential. That is, that unless care is taken the protective covering which nature has spread over the surface in the form of vegetation will be removed and destructive conditions started in operation. The less the absorptive nature of the surface the sooner the rain escapes, furrowing the surface and allowing it to dry out quickly. The danger is not so great where the rainfall is distributed more evenly through the year and in a level country. In a region possessing the climate of California there is considerable danger in many places that man will so disturb the balance of the forces of nature that much harm will result. Let us take an illustration with which we are familiar, the shoaling of the bays and rivers from the detritus deposited from the water. In the case of the streams draining into San Francisco bay this has been laid chiefly to the hydraulic mines, but the blame is in part misplaced. Any one who travels over the hills and mountains can easily see, if he be observant, the erosion which has taken place since man began to cut into the hills for various purposes, since stock killed off the grass and formed innumerable paths, where gullies begin to be formed. With the covering of the surface broken, every heavy rain removes an immense amount of soil, a large part of which eventually reaches the rivers.

When we are better informed concerning the processes of nature, these and many other questions will be looked at in a new light.

The elementary principles of geology are perhaps less understood than those of any other science which has to do with our every-day lives. If we can get an insight into the subject it will not only prove of fascinating interest but be of the greatest practical value to all who work in or upon the earth.

Man has come to attain his present position through the operation of natural laws. The better and more thoroughly he attains to a knowledge of these laws, and especially those governing the changes and development of the earth on which he treads, the better he becomes fitted to make use of the inexhaustible riches around him.

Bolivian Mines.

The British Consul at Callao, in a late report, says that Bolivia derives her wealth almost exclusively from her mining industry, which is on an important scale. No country in the world has lost so much in consequence of the fall in the value of silver, which is her chief production. This depression has been intensified by other causes, such, for instance, as the influx of water into the lower workings of the Huanchaca mines, and, so far, the efforts which have been made to drain them have met with no success. In the Potosi the Royal Silver Mining Company has not been very fortunate, although over $1,000,000 have been spent. However, an improvement is reported as having taken place of late. In Colquechaca former mismanagement of the principal mining establishment is said to have been the cause of the diminution of the production, but things are now on a better footing. On the other hand, the mines in the Oruro district have given satisfactory result. The amalgamating works at Huanchaca have just been closed. All the ores from Huanchaca and several other mines are now sent to the great reducing establishment at Antofagasta, called Playa Blanca. This establishment is one of the largest in the world, and is said to have cost from $7,000,000 to $8,000,000. Gold washing is carried on in Bolivia, but on a small scale. At Tipuani, to the north of La Paz, a good deal of this metal has been obtained at different times from auriferous alluvia. Even from the bed of the La Paz river, within thirty minutes' walk of the city of that name, small quantities are obtained yearly. Auriferous quartz is found in several parts of the country. A reef of considerable extent exists in the province of Chayanta, and another at San Simon, on the banks of the river Itenes. The latter has been greatly extolled, but it is said that fevers and wild Indians impede mining operations. The tin mines of Bolivia are of great importance. One of the most productive is that of Ayevaca, in the Oruro district. According to an experienced engineer, the lodes are from 1 to 3 feet wide, giving masses of solid ores averaging some 40 per cent of the metal. The tin ore is found along the eastern border of the plateau from Lake Titicaca to near the south boundary of the Republic, but the richest zone lies between latitudes 17° and 19°. It is estimated that the yearly output is from 5000 to 6000 tons. Copper of

excellent quality is obtained from the Corocoro district. It is packed in bags in the form of "barilla," sent in barges to the mouth of the Desaguadero canal, and conveyed across Lake Titicaca in the steamers of the Peruvian Corporation. From Puno it is sent to Mollendo for shipment to Europe. The mode of extracting this ore is a very primitive one; were suitable machinery used the production could be greatly increased. The Chorolque mines, in the department of Potosi, are of great importance, but the fall in the price of bismuth has affected them greatly. This industry is in the hands of one firm, which has been acting in concert with other producers in Europe for the purpose of establishing a monopoly of that article.

The Yukon, Alaska Mines.

Written for the MINING AND SCIENTIFIC PRESS by BYRON E. JANES.

This winter there are about 1200 men in the country, distributed as follows: About 700 at Circle City and the tributary diggings, possibly 25 on Seventy Mile and American creeks between here and there, about 125 at Forty Mile and the diggings on the head of Forty Mile and Sixty Mile rivers, and at least 350 in the new Bonanza and Hunker districts.

A fair idea of the general location of these places can be had from a U. S. Coast and Geodetic Survey map. Bonanza and Hunker creeks are tributaries of the Klondiek river near its mouth. It is about fifty miles above here and three miles above old Fort Reliance, on the east branch of the Yukon. The town started at the mouth of the Klondiek river has been named Dawson, and already boasts a sawmill, three saloons and about fifty cabins. Bonanza creek was discovered in the latter part of August, and in one month the discoverer took out $1000. Since the cold weather began, so that holes could be sunk by thawing the gravel, commonly called "burning," the creek proves to be as rich as any yet found in the Yukon country. One of the richest claims has a pay streak 30 feet wide of 3 feet of bedrock and 4 feet of gravel, which will average, it is claimed, $1 to the pan, but I think 50 cents is nearer it. For two miles each way from this claim good pay has been located at close intervals.

About half a mile above the Discovery claim is a tributary of Bonanza, called El Dorado, which has very good pay for a mile and a half from its mouth, though it is not equal to that on the first claim mentioned.

Hunker creek has not been prospected much yet, but will doubtless have some good claims. Bonanza creek is about twenty-five miles long, and on it and its tributaries there are located probably 400 claims of 500 feet each, and half that many in Hunker district. Of that number, some will never pay, many will pay wages and maybe a little more, and a goodly number will give their owners snug sums.

The prevailing wages of the country are $1 per hour, depending on the distance from the supply point. From five to eight hours is a winter day's work.

The diggings at the head of Forty Mile and Sixty Mile rivers are from one to ten years old, and, while none of them are so extensive as Bonanza's, they have had diggings as rich as any but the very best on Bonanza.

Now, as to the methods used: The diggings are of two classes—summer and winter. Most of the creeks have a slight fall and wide bottoms, the gravel being covered by 1 to 10 feet of muck, or soil, (not glacial drift). The bedrock is often 20 feet deep, and since the ground never thaws more than 2 or 3 feet from the surface, drains and ditches are expensive; so each winter more "burning" is done, which consists in thawing the gravel by fire, removing it and repeating. The muck thaws but little, and makes a good roof for drifting. The dumps are sluiced with the first water in the spring. Sometimes the creeks do not freeze up solid and the water gives trouble—that being the case this year in places where the average temperature for the past five weeks was 10° below zero. There is promise of a cold spell—the coldest, 45° below zero, being recorded to-day. Last year at this time the daily mean was 55° to 65°.

Summer diggings are expensive to open for work, but the net returns are often more than if "burning" had been the method. In most cases lumber must be whipsawed, the average cost being $150 per thousand feet. Other things being in proportion, considerable expense is incurred before the ground is ready to shovel into the sluice boxes.

In all probability there will be work for all that come in this spring. Bonanza is in an unprospected section of the country, though there may not be many new creeks found. No one should think of coming unless he can land with $500, if he purchase his outfit at Juneau, and twice that if he purchase after arrival here.

But little attention has been paid to quartz particularly, as the hills and valleys are covered by a heavy growth of moss. So far nothing but small stringers have been found in the bedrock. Nuggets are often found which are more than half quartz.

Forty Mile, Northwest Territory, Jan. 21st, '97.

Charactertistics of the El Dorado Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS by A. THURSTON HEYDON.

Of all the mineral belts gridironing the western slope of the Sierra Nevada, none has yet equaled the mother lode in its entirety as a wealth producer, for, aside from the value contained in its immense ore bodies, in its immediate neighborhood, unmistakably formed from the gold released by the wearing away of its ledges, were placer deposits whose richness has never been surpassed in mining history. This belt, which is not only the oldest, but was formed, as a whole, under the most favorable conditions, has been a marvel to the mining world, not only because of its great extent, but also on account of the great size and permanent character of its ore bodies. No other gold-bearing quartz belt in the world has yet equaled it as a wealth producer.

Rich though it be, all portions are not equally mineralized, consequently, on account of the permanent character of its mineral centers, the most prosperous quartz mines along its course are located in the immediate vicinity of the places noted for the richness of their placer deposits.

El Dorado County.—This is the county in which Marshall made his discovery of the great placer deposits of the Sierra Nevada on the 24th day of January, 1848. While it would be difficult to prove that it was the richest portion of California, still the statement that no portion of the State was richer is beyond successful contradiction.

The mother lode runs north and northeasterly from one side of the county to the other, a distance of some thirty miles. Partly on account of a change in the line of the forces which elevated the Sierra Nevadas, and partly from the compression caused by the intrusion of large masses of igneous rocks, principally to the west, the line of the mother lode has been deflected, and, in the northern portions, where the igneous rocks had intruded themselves within the belt itself, its various ledges diverge and apparently abruptly terminate at the northern boundary of the county. At this point, to all appearances, the line of weakness, along which the fissures opened, shifted westward, although it still continues northward.

This change of conditions, whose attendant effects will be touched upon in the description of the formation of the "central belt," under which the mother lode in this region was formed, has produced a mineral section differing more or less from any other upon its line. For this reason it has been misunderstood, mismanaged and condemned for years. Still, in spite of these drawbacks, time will prove that twenty-five miles of this belt, with Placerville as the center, will yet equal any other twenty-five miles in the whole State.

Placerville.—In the early days Placerville was the most important town in the mining region and the second largest in the State. Its wealth in placers was almost fabulous, and the mother lode runs directly through it. Every ravine fed by the gold released by its wearing away was literally paved with gold, and the total yield of placer gold derived from this source alone seems like an Eastern fairy tale, as it foots well up into the millions.

The Central Belt of the Mother Lode at Placerville.—As far as can be determined by the present developments the central belt of the mother lode was formed in the following manner at this point: During the process of mountain building which uplifted the Sierra Nevadas the slate belt known as the Mariposa formation was lifted on edge, and shortly afterwards the dyke of feldspathic, chloritic and magnesian rock, now called serpentine in its altered form, was intruded, and this, locally called "greenstone," forms the foot or western wall of the central belt, which dips east.

At various periods thereafter the long-continued strain opened and reopened fissures along the line of weakness upon its eastern side. At first these fissures extended to the depths favorable for the formation of a calcareous or lime rock, locally known as porphyry. After various fissures had been filled with porphyry came the tremendous pressure from the western intrusion of igneous rock, which crowded the whole formation eastward, fracturing and shattering it to a marked degree. Afterwards another period of uplifting reopened the fissures, which penetrated this time to the mineral producing sections of the earth's crust.

The mineral, upon its way to the surface in the form of metallic vapors, also in solution with hot waters, was deposited with a regular irregularity wherever the conditions were favorable for the precipitation and accumulation of mineral. The hot mineral-laden waters oozed through the network of seams in the greenstone, porphyry and slate, depositing gold and quartz in the seams, as well as enriching the enclosing rocks themselves by infiltration. During this process many of the rocks became altered, as the hot waters dissolved many of their constituents and replaced them by others. In places the conditions were favorable for the regular process of ledge formation, that is, the enlargement of the fissures by the hot waters dissolving and carrying away a portion of the enclosing rocks in return for the mineral deposited, until a regular ledge of size was formed.

But to a large extent the gold was deposited in the seams; consequently, when there was an opportunity to cut out and fill, the waters had nothing but quartz to deposit, the result being the formation of a body of barren quartz. This fact has led many astray, as they were so accustomed to finding the pay within the bodies of quartz that the idea seems never to have occurred to them that the pay could be associated in any other way in remunerative quantities.

In the mother lode it is no uncommon occurrence to find that the quartz-seamed black slate associated with the ledge contains enough gold to pay for working, while it is all that enables some to be operated profitably. In such cases it has been transformed by the ledge-producing agencies, until it has become pay ore, and is then known by miners as "black quartz."

The Location of the Pay.—The pay, especially near the surface—as developments have proven that the ledges grow more regular with depth—will be found in the quartz-seamed slate, the quartz-seamed porphyry and in the quartz-seamed greenstone, on whose eastern side have been found the largest deposits of gold produced by the mother lode. The large masses of quartz, until the formation becomes regular with depth, are comparatively barren, for reasons above stated. The pay is, to a large extent, in what was country rock, what still looks like country rock, but is not country rock, as it has been so altered and mineralized that it has become ore.

The Cry of Pockets.—The opinion prevails to a marked degree, among shallow thinkers, that because a ledge contains pockets to a marked degree it is not a milling proposition. Yet an ore body is nothing but an immense pocket. In this section all ore bodies contain pockets of greater or less value. The pocket formation to beware of is that in which only an occasional pocket is found and everything else is barren. To such the term "pockety" is extremely applicable.

It makes no difference whether the pay is in plates or fine; whether it occurs in a solid quartz ledge or in the fine quartz seams and altered country rock; whether in pockets or evenly disseminated throughout the mass, if it is only there in sufficient quantities to make a profitable average.

Regarding this point, the ledge matter moved by pocket hunters on a section of the main belt 1700 feet long, in their search for pockets, has been measured and, taking only the gold, concerning which there is definite information, and leaving out the amounts taken out irregularly, as well as the values remaining in the rock, too poor to crush in a hand mortar, the division gave an average of over $8 per ton. This was where $3 rock in such quantities would have paid a heavy dividend if properly worked, and also where every one has claimed for years that the ledge was only good for "pocket hunting."

Electric vs. Water Power.

According to the Calaveras *Prospect*, the following figures from the California Exploration Company show the comparative cost of water power under various heads at 20 cents per miner's inch and electrical power in the districts in Calaveras county which it is proposed to supply:

Head in feet	Horse power	Inches	Water power, value per month	Electricity, value per month	Difference	Favor
100	15	62	$ 372.00	$127.50	$ 244.50	E
"	28	109	654.00	210.00	444.00	E
"	44	172	1,032.00	330.00	702.00	E
"	62	246	1,476.00	441.00	1,035.00	E
"	112	439	2,634.00	728.00	1,906.00	E
150	13	34	204.00	110.50	93.50	E
"	28	76	456.00	210.00	246.00	E
"	50	134	804.00	375.00	429.00	E

RATES.

Up to and including 1 H. P., $12.50 per H. P. per month.
From 2 H. P. to 10 H. P., $10 per H. P. per month.
From 11 H. P. to 25 H. P., $8.50 per H. P. per month.
From 26 H. P. to 50 H. P., $7.50 per H. P. per month.

The Spitzkasten and Settling Tank.*

By R. H. RICHARDS and C. E. LOCKE, Boston, Mass.

In "Sorting Before Sizing" (a paper first announced at the Pittsburg meeting, February, 1896, but delayed in preparation and now presented at the present meeting) it is shown that if slime tables are to do their best work on slimes below 0.5 mm. or 0.02 inch in diameter they must be carefully sorted or classified, and fed to a series of tables suitably adjusted to the different slime sorts. The reason is that the coarser and finer slime sorts require respectively different adjustments of the tables. Hence, if the two are fed together upon a table which has, as nearly as may be, average adjustments, fine galena, for example, will go into the tails, or coarse quartz into the heads, or both—losses which could have been largely prevented if the slime had been carefully sorted and each sort sent to its own slime tables.

As indicated in the paper just mentioned, the present tendency in this country is generally to do away with slime sorting or "classification," and simply take the overflow from the hydraulic classifier and divide it among the tables by means of a distributing tank. We must, therefore, look to the old country to see what means of slime sorting have been approved.

The spitzkasten is the only apparatus recognized by such authorities as Rittinger and Linkenbach. Reducing Rittinger's Austrian measures to metric units, we find that in 1866 he recommended for 100 liters per minute the following dimensions:

	Width, mm.	*Length, mm.*
First box	100	1896.6
Second box	200	2845.0
Third box	400	3793.2
Fourth box	800	4741.5

And so on. Increased quantity of material treated widens in geometrical progression, and lengthens in arithmetical progression, the pointed boxes.

Linkenbach (1887) recommends for 100 liters per minute of slime:

	Width, mm.	*Length, mm.*
First box	228	3600
Second box	342	4800
Third box	513	6000

With the same rule for increased quantity. Both authorities declare that 50° is the minimum angle that can be allowed for the sides of the box, but their diagrams mostly show as much as 58° for the minimum angle.

Rittinger, who was the inventor of the spitzkasten, describes its action as a separation in a horizontal current according to the law of equal settling particles. In the light of recent investigations we prefer to use the term "free settling." He says, further, that, in order to prevent slime from depositing, the sole of the feed distributor should descend to the inlet of the box at an angle of 1° 15′ or 0.25 inch to 1 foot for the coarser sorts, and 0° 6.25′ or 0.02 inch in 1 foot for the finer sorts, and should enter at the exact level of the exit. Linkenbach favors raising the sole of the feed distributor to 1 or 2 inches above the entrance, for the same purpose.

For the last box, Rittinger favors destroying the surface current by an inverted dam, making thereby a settling tank of this box. Linkenbach favors cutting up the boxes, when they are large, into two smaller sets, thereby discharging the spigot products at a higher level, and diminishing the weight of the loaded apparatus.

Both authorities make note of the fact that the spitzkasten gives only an approximation to true sorting according to the law of free settling particles, but neither authority tells wherein, or how far, the spitzkasten departs from perfect sorting.

In these directions the authors have sought to supply some missing data, and the lines which their investigation has taken are:

First—The horizontal current; what is its form and what becomes of it?

Second—The feed distributor; what is the effect upon the current of varying the angle of its slope?

Third—Can the current be so confined as to make it a true horizontal current?

Our spitzkasten is like that of Rittinger in every respect, except that we need no spigot to discharge water below, and our sides are vertical (which, indeed, is the case also in some of Rittinger's boxes).

As representing nearly the speeds of the three boxes of Linkenbach for a width of 8 inches, three rates of current were selected, namely, 190, 126 and 85 pounds of water per minute, respectively.

I.—*The Form of the Current.*—These experiments show, in the first place, that the surface current has the form of a wedge, widening (*i. e.*, deepening) towards the outlet, and having, for the current of 190 pounds per minute, an apex angle of 11°, and for 85 pounds 24.5°. The angle found for the 126-pound current was 16.5°. The water composing these wedges is most rapid on the surface (where the friction of the air may be disregarded), and the surface velocity is: For 190 pounds per minute, 10.84; for 126 pounds, 8.29; and for 85 pounds, 7.05 inches per second. The velocity decreases with increasing depth, until at the bottom of the wedge it does not exceed: For 190 pounds per second, 3; for 126 pounds, 2; and for 85 pounds, 1 inch per second.

*Trans. Am. Inst. Min. Eng., Chicago Meeting, February, 1897.

These wedges are the result of the mixing of the so-called stagnant water below with the surface current by an action to which we shall refer as head suction, or upward current on the head partition, which widens them and slows their speed.

In the second place, it will be noticed that there is a wide undercurrent or eddy, returning down the slope of the tail partition, and carrying with it a portion of the slime, which should be taken to the next box of the series, but which passes, instead, down the tail partition to the bottom and then up the feed partition to rejoin the wedge.

Thirdly, we notice that there is a top layer which passes off at the outlet.

An approximate estimate was made of the two quantities, namely, that going over the outlet, and that passing down in the undercurrent. From these dimensions and the width of the spitzkasten (8 inches) we can compute the following values:

Water per minute. Pounds.	*Overflow. Cubic inches per second.*
190	86.6
126	58.0
85	39.6

These results were checked by weighing the overflow with scales, the result being:

Water per minute. Pounds.	*Overflow. Cubic inches per second.*
190	87.7
126	58.0
85	39.2

We get also as the measure of the undercurrent:

Water per minute. Pounds.	*Undercurrent. Cubic inches per second.*
190	134.5
126	263.4
85	230 7

These figures show an extraordinarily large quantity of slime-charged water sent down into the stagnant pool in proportion to the feed and overflow. There are, to be sure, errors in the computation.

The authors are of the opinion that a flat layer which comes in at the feed and goes out at the outlet without forming a wedge with its tail undercurrent and head suction is the ideal condition to be attained, if possible, and that the more any particular form departs from that ideal the more unsatisfactory it is.

II.—*The Slope of the Feed Sole.*—A series of trials was made to get the best slope of the feed sole. The angles tested were 0°, 5°, 8°, 10°, 15°, 20°, 25°, 28° 30′ and 30°. Of these, 5° to 10° gave the narrowest angle of wedge with all the different water quantities. This conforms with Rittinger's and Linkenbach's requirement, namely, that fine slimes must be prevented from settling on the feed sole.

Angles larger than 10° tended to widen the wedge somewhat, and showed no gain to compensate for the loss of head. When 30° was reached a curious change took place. The whole current followed down the slope of the head partition and formed a head undercurrent, that is, a current at the feed end. Since 30° is more than half of 58°, the sole was set at 28° 30′, or about one-half of 58°; and the curious phenomenon was then observed that the feed current was indifferent as to which of the two ways it would go, namely, as a head undercurrent or as a horizontal surface current. By placing a bit of iron plate under it it could be guided to become a surface current, and by placing the sheet iron over it at the proper angle it could be deflected downwards and become an undercurrent. But it absolutely refused to take any intermediate position. It was either surface current or undercurrent, and, when once directed, it would continue to flow as directed after the guide plate had been removed.

Next a special set of variations in feed slope was tried, comprising the following forms:

1. A catenary curve having 6-inch drop and 6-inch advance.

2. A cycloid curve, drawn by 6-inch circle, rolling on a straight line.

3. A horizontal feed sole, depressed 1 inch below the overflow.

4. A horizontal feed sole, raised 1 inch above the overflow, and meeting the head partition at an obtuse angle of 122°.

5. A horizontal feed sole, raised 1 inch above the overflow, its end being cut off square.

The catenary (No. 1) gave a higher speed than the 5°-slope feed sole; but no gain in angle of wedge or diminution of tail undercurrent was observed.

The cycloid (No. 2) gave the most rapid current of all; but no gain in wedge angle or diminution of tail undercurrent was observed.

When the horizontal feed sole was depressed 1 inch (No. 3) it gave a wedge angle of 25° for 190 pounds water, which was wider and more unsatisfactory than that for 86 pounds.

When the horizontal feed sole was elevated 1 inch (No. 4) above the outlet, and the feed sole and head partition met at an obtuse angle of 122°, there resulted a head undercurrent like that given by a 30°-slope, the horizontal current having disappeared altogether.

When the horizontal feed sole was elevated 1 inch, but the end of the board was sawed off square (No. 5), a case of equilibrium was presented like that of the feed sole sloping 28° 30′; a plate-iron guide could cause it to establish either a surface current or a head undercurrent, and, once established, the water would flow on in the course allotted to it until it was disturbed.

Our conclusion is that a flat feed sole, sloping 5°, and joining the head partition at the level of the overflow, will give the best results.

By the experiments recorded above we are satisfied that the spitzkasten is not a scientifically exact instrument. The trommel, jig, spitzlutte and separator, when well constructed, and the slime table, when properly adjusted, are all scientifically accurate instruments; that is to say, when fed with suitable material, and not overfed, they will all do perfect work. They depart from scientific accuracy only through overfeeding, or through the feeding of material that is not susceptible of perfect work, or through imperfect construction. The first two of these causes are due to the demands of commerce; the last, to ignorance.

The spitzkasten, on the other hand, is scientifically imperfect. It cannot be fed with such a product, or at such a speed, or so adjusted to suit its feed, that it will do perfect work. There is always the tail undercurrent to contaminate the product from the spigot.

Can this defect be cured in any way? Three means have been considered, consisting in the use, respectively, of

(*a*) A balanced hydraulic water supply.

(*b*) An upward current of hydraulic water.

(*c*) A perforated board.

Under *a* and *b*, by balanced hydraulic water is meant an addition of hydraulic water, which will exactly supply the spigot with the right quantity of water, no more and no less. This is an extremely difficult thing to do. A slight excess of water, that is, an upward current, will prevent a free discharge and cause a troublesome accumulation of products in the box; while a slight deficit will carry down contaminating fine slimes.

The method of applying this water by a vertical tube inside the box is not approved by the authors, as it will seriously disturb the surface current. If hydraulic balance water is to be used, it should be put on outside with the T and plug or T and gooseneck discharge.

Under *c* (perforated board) a ¼-inch board was perforated with ¼-inch holes, which were 1 inch from center to center on the cross rows, while lengthwise the rows were 1 inch apart from center to center; but the holes of one cross row were staggered ½ inch with the holes of the next. This was done throughout to give the grains full opportunity to fall through the holes.

This perforated board was 47½ inches long, of which 12 inches was blank, and served for feed sole, while 35½ inches was perforated, as above described. The board was placed horizontal, with its top surface on a level with the overflow.

The apparatus was, therefore, a continuous acting rinne (German) or run (Cornish), in which the grains suitable for deposit at any time could drop through the holes, and those not suitable could be carried forward.

This perforated board must have, at least, a balanced hydraulic water. It is quite possible that if the hydraulic is introduced in the stagnant water space, with means to break up its current, a noticeable upward current could be used, which would go far towards keeping out altogether the objectionable fine slimes, and towards the yielding of a product truly sorted, according to the law of free settling particles. Such a hydraulic should be applied as a horizontal current for the whole width of the box, and directly beneath the feed sole.

The authors are aware that a perforated board has been used in France. They, however, did not know of its existence until after the work here recorded was done. They are aware, also, that the Kohinoor mill, in Missouri, has a spitzkasten with a first box supplied with a horizontal lattice work.

The Settling Tanks.—The overflow from a spitzkasten with balanced hydraulic water must go to a settling tank to extract the pulp which is to feed the last table, as the slime water has not been lessened, and may have been increased, in volume by its passage through the spitzkasten.

A settling tank which is fed with a horizontal current at the surface will have a bad surface current of wedge shape, which will probably have an angle not narrower than 12° nor wider than 25°, according to the way the current is introduced. If it is fed above the surface it will produce a head undercurrent, which is as bad as the surface current. If it is fed with a plunging stream, this will pass to the bottom and flatten and form a bottom undercurrent. All these ways of feeding are, therefore, bad.

To make the most of a settling tank, the current of feed slime must be brought to approximate rest as soon as possible after entering the tank, and a very slow movement must be established, which is of uniform velocity from top to bottom and from side to side. An even surface distributor across the inlet end, deep enough to slow the current greatly, and with a bottom steep enough to prevent the settling of slime, and this followed by two gratings made up of vertical bars 1 inch square with 1-inch spaces, the bars of the first grating staggered with those of the first, will probably prove satisfactory.

The Consolidated Kansas City Smelting and Refining Company.

The metallurgical works of the Consolidated Kansas City Smelting and Refining Company consist of three reduction plants and one refinery, all of which taken together constitute the largest and most modernly equipped institution of the kind in the United States. The parent plant, located at Argentine, a suburb of Kansas City, Mo., comprises reduction and refining works. In the reduction department of this plant the equipment is modern and thorough for reducing silver-lead ores to base metal and also for reducing copper ores to copper matte. In the refining department the base bullion is handled and the gold, silver and lead are separated from each other. A special feature of the refinery consists of a complete and extensive copper-refining department, where the copper matte is reduced to refined copper ingots. The Argentine plant covers an area of twenty acres of ground and at this time it has a smelting capacity of 15,000 tons of ore per month. The capacity of the refining department is as follows: Silver-lead refining, 6000 tons of bullion per month; copper refining, 1,000,000 pounds of ingot copper per month. During the year 1896 the silver-lead refinery produced at the rate of 1,250,000 ounces of silver and $335,000 of gold per month. The Argentine plant was established in 1881 and the first year's output, that of 1882, was 2168 ounces gold, 645,246 ounces silver and 13,651 pounds of lead. To show the growth of the plant in the intervening time, it may be cited that within the year 1896 the total output was: Gold, 201,343 ounces; silver, 5,482,924 ounces; lead, 82,413,919 pounds; copper, 4,438,814 pounds. This output for 1896 was the result of handling at the Argentine plant of over 300,000 tons of raw material.

This company's Colorado plant is situate at Leadville, the greatest producer of carbonate silver-lead ores of any camp in the world, and which is now becoming prominent as a producer of high-grade gold ores. The Leadville plant, known as the Arkansas Valley Smelter, has all the equipment of a modern smelting plant, having a capacity for the reduction of 27,000 tons of ore per month. The Leadville plant covers ten acres of ground and is the most thoroughly equipped smelter in the State of Colorado. Its location at Leadville will be recognized as an advantageous one, when it is recalled that this district has never been equalled as to tonnage of ores produced. It is on a great mineral zone which shows no signs of exhaustion. The constant discovery of new ore bodies and the opening of new mines, with a tendency to a widening of the district, prove all this. Notwithstanding the labor troubles of the past year, which seem now to be practically settled, the camp has steadily produced a large tonnage of ores. A striking feature of this production has been the marked increase of the gold output, which in 1896 amounted to $1,524,363.

The third plant belonging to the Consolidated Kansas City Smelting and Refining Company is located at El Paso, Texas, the gateway city between Mexico and the United States. This plant is the pioneer among smelting works in the Southwest, whose establishment at El Paso resulted in a rapid development of the mining interests of New Mexico, Arizona and Mexico, and made it possible for mine owners in those Territories to send to El Paso a grade of ore which would not bear shipment to more distant smelters. Its establishment has likewise opened avenues for other industries to thrive, which otherwise could not have existed.

By reason of the location and equipment of this company's three reduction plants, they are able to draw ore supplies from all parts of the United States, Mexico, British Columbia and Canada. While the Leadville plant obtains its principal supply from the Leadville district, a considerable tonnage of ore is treated which comes from Creede, Cripple Creek, Red Cliff, Breckenridge, Aspen and other Colorado camps, and from points in Utah, Montana, and the Cœur d'Alene lead regions of Idaho.

The El Paso plant derives its supply from New Mexico, Arizona and Mexico. The Argentine plant draws from the larger and more general field of Colorado, New Mexico, Arizona, Utah, Montana, Idaho and British Columbia. The Argentine refinery handles the base bullion from the company's Leadville and El Paso works, and as well from various independent smelting plants of the United States and Canada.

A subordinate branch of this company's business is done by the Mexican Ore Company, which was organized by them some time ago to operate in the Republic of Mexico. This ore company has handled from 50 to 80 per cent of the ore exported from Mexico, and which has been handled chiefly by the smelters and refinery of the consolidated company. In many of the principal mining camps of the United States and Mexico the Consolidated Kansas City Smelting and Refining Company maintain sampling works for the purpose of purchasing and sampling ore to ship to their reduction works. The same company is also an operator of mines in the United States, British Columbia and Mexico, from which its reduction plants draw a portion of their ore supply. It also has offices in Denver, Colo.; Salt Lake City, Utah; Spokane, Wash.; El Paso, Texas; Hermosillo, Chihuahua and Pachuca, Mexico; and the City of Mexico.

As an evidence of the business which this company furnishes the railroads, it may be cited that within the year 1896 the company shipped 25,000 carloads of freight, aggregating about 300,000 tons, making a revenue to the railroads of about $1,750,000. The company has in its employ at its smelters, samplers and offices about 2500 men.

WORKS OF ARKANSAS VALLEY SMELTING CO., LEADVILLE, COLO.

THE commissioner of patents reports for the calendar year 1896 total cash receipts of $1,324,059, and the total expenditures $1,113,413. The balance in the treasury on account of the patent fund, January 1, was $4,718,639. During the year there were 43,982 applications for patents, designs and reissues; 23,373 patents were issued and reissued, 1,864 trade marks, labels and prints registered, and 12,133 patents expired during the year. There are left pending action a total of 8,867 applications. The number of applications exceed previous years by nearly 3000. The report says the work at the end of the year was only thirty days behind, but the record cannot be kept up with the present force.

Costs of the Past and the Present.

The fall in prices of materials, wages and other charges connected with mining has had more to do in most districts in the West with the reduction in the cost of producing gold and silver than have the improvements in methods. In the Comstock, according to the late J. Ross Browne, in his United States Mineral Resources for 1868, the cost of running 938 feet of tunnel in the 400 level of the Gould & Curry was $16.84 per foot, and of 1465 feet on the 200-foot level $16.08 per foot. In the same mine the average cost of extracting ore for the year 1866 was $8.82 per ton. In the Gould & Curry it was $7.86 and in the Hale & Norcross $9.08. In commenting on this, Mr. Browne said: "These results show a marked improvement on previous years, and enable lower-grade ores to be worked more profitably than was formerly the case."

In 1867 the cost of milling Savage ores was $14.04, Hale & Norcross $14.26, and Gould & Curry $13.30. The cost of sinking the four-compartment Bonner shaft of the Gould & Curry to a depth of 692½ feet was $75,738.40.

In Colorado a comparison of the cost of supplies in 1870 and at the present time shows that on an average $27 will buy as much now as $100 in 1870. The following table has been published lately in a Colorado paper:

	1870.	*1897.*
Stamp mill charges, per cord (8 tons)	$35 00	$10 00
Labor, per day	4 00	2 50
Lumber, per 1000 feet	60 00	18 00
Teaming, per day	16 00	4 00
Candles, per box	20 00	4 00
Giant powder, per pound	1 00	14
Fuse, per 1000 feet	30 00	6 00
Nails, per keg	20 00	3 00
Iron, per pound	25	03
Steel, per pound	40	09
Wood, per cord	8 00	5 50
Coal oil, per gallon	3 00	20
Shovels, each	2 75	1 00
Picks, each	3 75	1 00
Rope, per pound	60	15
Smelting, per ton	65 00	10 00

Alabama Mineral Products.

Below are totals of outputs for January, 1897:

	Tons.
Coal	416,858.4
Coke	92,112.0
Iron ore	132,713.0
Pig Iron	60,352.0

This being the first month this effort to obtain statistics has been made, the returns, including totals, are imperfect, and represent only about 75 per cent of actual production for January in Alabama.

State Geologist and Sec. Ala. Ind. and Sci. Society.
University, Alabama, March 8, 1897.

Scientific Progress.

An Improved Pyrometer.

The air thermometer is used for laboratory work in making precise determinations of very high temperature, but is not suited for every-day use in manufacturing establishments. For this purpose the latest form of Le Chatelier pyrometer promises much. The following description is condensed from an article by Dr. Russner in the *Zeitschr. d. Oesterr. Ing. u. Arch. Vereines*:

Heretofore the fact that an electric current is developed when the junction of two dissimilar metals is warmed has been applied to the indication of very slight differences of temperature, as in the well-known thermo-electric pile. In the Le Chatelier pyrometer, however, the principle is modified by using two metals so nearly alike that a high temperature is needed to produce a moderate electro-motive force. Briefly, the element consists of two wires—one of platinum and the other of an alloy of platinum and rhodium, each wire being about one meter long, and the two being fused together at one end. One of the wires is inserted in a porcelain tube open at both ends; the other is carried along just outside, so that the junction of the wires is at the end of the tube. This tube is then slipped into another tube, also of porcelain, but closed at one end, the junction of the wires being in the closed end, and the two free ends of the wires brought out to connections to a galvanometer.

The whole is enclosed in a protecting tube, open at the end, which is inserted into the furnace whose temperature is to be determined. Since both platinum and the platinum-rhodium alloy have very high fusing points, the portion of the instrument which is exposed to the heat is able to stand very high temperatures, while the galvanometer upon which the readings are made may be at any distance from the furnace, either in the office or in any desired part of the establishment.

Each pyrometer is calibrated by comparison with an air thermometer, and it has been found that an alloy of 90 per cent platinum and 10 per cent rhodium for one wire, and pure platinum for the other, give an electromotive force nearly proportional to the temperature, so that a temperature of 1800° C. produces 1800 microvolts, etc. This is almost exactly true for temperatures of 700° C. and above. An alloy of 85 per cent platinum and 15 per cent rhodium produces a feebler current, an electromotive force of 800 microvolts being produced by a temperature of about 1650° C.

Experimental comparisons with the air thermometer have shown that the Le Chatelier pyrometer will determine temperatures within an error of ± 5° C. for 1000°. One of the instruments was subjected to the continuous action of a Siemens regenerative furnace in a glass works for three and one-half months without injury, following the variations of temperature between 1100° and 1600° C; when recompared with the air thermometer the zero was found to be unchanged.

In this connection the following determinations of fusing points made by the Le Chatelier pyrometer and those of previous observers are given, those of Holborn & Wien having been made with the new pyrometer:

	Voille.	*Barus.*	*Holborn & Wien.*
Silver	954°C	986°C	971°C
Gold	1,045°	1,091°	1,072°
Copper	1,054°	1,096°	1,082°
Nickel		1,476°	1,484°
Palladium	1,500°	1,585°	1,587°
Platinum	1,775°	1,757°	1,780°

A NEW PROCESS for the protection of iron structures against the injurious action of rust has been suggested by a German chemist, M. Deninger of Dresden. It consists of treating the iron with a solution of ferrocyanide, which forms a coating of cyanide of iron, uniform and impermeable to water, and of such a nature as to protect effectively the iron covered. The operation, applied on a large scale, is reported to have already given good results. The following is the method adopted in practice: The solution is mixed with a flaxseed varnish, to which has been added a little turpentine or benzol, so as to cause a very homogeneous emulsion, which can be applied without difficulty. The evaporation of the alcohol leaves the flaxseed varnish, which forms a coat protecting the cyanide of iron which is deposited upon the iron. There is no necessity of previously preparing the iron in any way beyond removing the beds of rust which are too thick to admit of the action of the ferrocyanide.

An Unnecessary Change.

Coleman Sellers, M. E., in his paper on the metric system, read before the American Society of Mechanical Engineers, concluded as follows:

"It is the thing just now to favor the change. A young engineer enlisting himself in the ranks of the metrical reformers (?) buys a cheap scientific notoriety. He is brought into sympathy with the self-constituted advanced thinkers. Those who oppose the change after having become familiar with both, are said to 'sever themselves from the congenial sympathy of the enlightened public opinion of today.' The mechanical engineer can accept nothing as true until he has demonstrated the truth by experimenting; at least, in anything capable of being put to the test of experiment. It is in the power of any intelligent man to test the metric system as others have done. He will, I think, find that the savants who originated the scheme before mechanical engineering, as it now exists, was known as a profession, made the mistake of beginning at the wrong end, the big end of the scale, the size of the world, and by the time they had cut it up or down to human wants it came out less fitted to human requirements than if they had recognized in the beginning the needs of the beings who were to use it.

"Our meteorological reformers urge us to adopt a new system in place of our present one, a system that harmonizes in no way with anything we now use. This new system is practically based on a certain measure over 39 inches long. This is cut up into 1000 parts, and 100 of these parts cubed gives their primary vessel of measurement. The contents of this vessel in distilled water under certain conditions is their pound weight. Had the English yard of 36 inches been so treated it would have been as good a system, but no better. It would have been as inapplicable comfortably to our profession as is the metric. The wonderful extension of the metric system to time and infinite space was given up as impracticable long ago, and we are now asked to bear the shock of a mighty change, to use this inconvenient system, this unhandy system of 10, for the sake of uniformity with some other peoples of the world.

"In conclusion, when we take into consideration the enormous interests involved in manufacturing in America, if it is, as we think, unwise to tamper with the existing metrology of our workshops, the question may well be raised as to the wisdom of enforcing the metric system in trade generally. The practical mind of Americans has already dispensed with much useless stuff, coming to us with our old metrology; is in not better to continue to amend what we have, to encourage the uniformity so desirable, rather than to attempt to make all things new, but in no respect practically better, at so frightful a cost?"

ENVELOPES lined with tinfoil will possibly be a "fad" in the near future, if experiments with the Roentgen ray continue. It has already been demonstrated that the contents of a sealed letter, enclosed in the ordinary envelope, may be photographed. The *Gaulois*, a French paper, has photographed such private matter in fifteen seconds. By using envelopes lined with tinfoil letter writers can defy the X rays in the hands of the inquisitive.

ALUMINUM is little acted upon by mineral waters and withstands the action of sea water better than iron, steel or copper.

Electrical Progress.

Electricity from Carbon Without Heat.

Willard E. Case lately delivered a lecture before the New York Electrical Society on this subject, which has long been engaging the attention of scientists, and while they have succeeded in a number of ways and some of them quite efficient, either the cost of the materials, the lack of efficiency, or the great trouble involved in the proper maintenance of the operation, or all combined, has left the development far short of the ideal, so that to-day the burning of coal under a boiler, the transformation of the latent heat of steam into mechanical energy, and the latter into electrical energy by means of the dynamo, with all of its attendant losses, still remains supreme.

Mr. Case in the course of the lecture said: "Now, the question which we naturally ask is, How are we to convert this potential energy of the carbon into electricity with the least loss? If the boiler, steam engine and dynamo are not available for our use economically, how shall we do it? We know that the voltaic battery does not act through the transformation of heat into electricity—it produces electrical energy direct. The zinc is oxidized and the potential energy of that zinc is converted directly into electrical energy without the production of heat. But the cost of this zinc and the chemicals employed to oxidize it are so expensive that we cannot afford to use them. The cheapest materials which present themselves at present to our notice are coal or carbon and the oxygen of the air. And if we could convert the energy of the coal into electrical energy direct and cheaply, we could do away with our steam motors, in time, provided the apparatus was simple and practical. Now, there is no known reason why a cheap substance may not yet be found which will act on coal and develop electrical currents in place of heat, but the general tendency of late has been to discard this method and to attempt to find some stable electrolyte or bath which will act as a carrier of the oxygen of the air, conveying it to the carbon and oxidizing it as zinc is oxidized in a battery, producing electricity. This electrical energy would be the equivalent of the heat energy that would be developed by the combustion of the coal in the ordinary way.

"Of course, the subject of electricity direct from carbon has been considered from many points of view. Some have attempted to obtain cheap electricity by using the oxygen of the air to oxidize various substances, others have attempted to oxidize coal with the oxygen of the air without heat, and others have attempted to oxidize coal by the oxygen of the air with the application of external heat."

Carbons for Electrolysis.

The extension of electrolytic processes in industrial chemistry has created a demand for terminals which shall be inexpensive and permanent, and numerous patents in this line have been taken out, especially in connection with the electrolytic production of the alkaline chlorides.

Gas carbon is not available in large sheets, such as are commercially required, and hence these have been made of powdered coke, baked with a cementing material in the same manner as electric light carbons are made. Such carbon plates, however, are not permanent, but soon become disintegrated by the action of the solutions, and especially by the action of the liberated gases.

Dr. Alber Lessing, in the *Electrochemische Zeitschrift*, claims to have solved the problem by producing carbon sheets entirely homogeneous and free from cracks, by a fusing process which not only insures the permanence of the sheet, but also increases its conductivity. The new product is said to be harder than steel, readily scratching glass, and proof against the emery wheel, and possesses a metallic ring which testifies to its homogeneity. If these claims are maintained, and the prepared carbon can be produced at a reasonable price, it should soon be on the market for many other uses as well as the one for which it was originally produced.

High Electric Voltages.

Apropos of the constantly increasing voltages in electric transmission lines, Mr. C. P. Steinmetz, the well known American electric engineer, recently remarked before one of the electrical societies that while only a few years ago 3000 volts were hardly considered commercially safe, 11,000 and 12,000 volts are now used extensively, and 15,000 to 20,000 volts are under discussion. The danger limit is reached in the high-potential lines, not in the step-up and step-down transformers. Transformers can be built and operated safely at voltages far beyond anything ever thought of for power transmission. Only a few months ago Mr. Steinmetz was able to reach, by stationary transformers, a potention of 160,000 volts effective, or nearly a quarter of a million volts maximum—by the way, probably the highest alternating voltage ever experimented upon by man, if we leave out electrostatic charges and oscillatory discharges as limited power phenomena, while in his case he had practically unlimited power—a 100 kilowatt motor—behind the 160,000 volts. In line insulators considerable progress has been made, and insulators can now be secured which will not be pierced below 50,000 or 60,000 volts effective alternating potential in dry weather. When damp, in fog or rain, a considerably lower voltage will leap or creep over the insulator surface and thus short-circuit the line, and this brings us to the real limitation of transmission voltage which exists at present—the climate. In a perfectly dry climate Mr. Steinmetz would not hesitate to consider 20,000, or even 30,000, volts quite safe, while in a very damp and foggy climate, in rain and sleet, half this voltage may be decidedly unsafe.—Cassier's Magazine.

Magnetized Watches.

In this age of electricity and electrically-propelled machinery, the wearers of watches are constantly coming in contact with sources of danger to the fine time-keeping qualities of their vest-pocket companions.

Non-magnetic watches are those in which the balance-wheel, hair-spring, roller-table, lever and 'scape-wheel are made of metals which are neither magnetic nor diamagnetic; and such watches have been brought to a high degree of perfection, some having been produced which have had nearly as close a rate as the best of those which are not non-magnetic. In addition to this, several varieties of anti-magnetic shields have been placed on the market, which are said to be more or less effectual in preventing magnetism in watches.

However, in the ordinary watch the hair-spring, roller-table, lever and 'scape-wheel are made of steel either wholly or in part. A watch of this kind will become magnetized by being brought in too close proximity to a powerful magnetic field, such as is developed in a dynamo or a motor.

It will be seen that as all the steel parts of the watch become permanent magnets under the conditions mentioned, each steel part thus assumes definite polarity and tends to place itself in a north-and-south position like a compass. Moreover, each steel part attracts and is attracted by, and repels and is repelled by, every other steel part in the watch.

The influence of these magnets, one on the other, and the influence of the earth's magnetism on the several parts, seriously impede their freedom of motion, thereby affecting the rate of the

watch, sometimes even causing it to stop.

A simple method to detect the presence of magnetism in a watch is to place a small compass (one with a very fine sensitive needle about 0.8 centimeters in length) directly over the balance-wheel and upon the "bridge" which supports it. If the needle oscillates, it is evident that the watch is magnetized. However, this test is not conclusive, as the hair-spring may be magnetized, and, under certain conditions, the needle will not show it.

Demagnetizers of various construction have been contrived, but none will thoroughly demagnetize all the parts of a watch unless the watch be taken apart and each steel piece submitted separately to the action of the demagnetizer, testing each piece each time it is passed through the machine in order to ascertain to what extent the magnetism has been removed, and again passing it through the helix in another position if it be found to still contain magnetism.

Mechanical Progress.

A Novel Use of Cast Iron.

Diamonds are used in dressing diamonds; steel is employed in finishing steel, and an Eastern shop has made the innovation of using cast iron lathe tools for cutting wrought iron, cast iron and brass. This may seem absurd at first, but upon reflection we know that cast iron can to a certain extent be tempered by chilling. Being thus made harder, it bears the same relation to ordinary cast iron, which is comparatively soft, that one grade of steel does to another. It has been found that tools cast of a chilling mixture, with that part of the tool which performs the work chilled, will work better than the same tools made of steel, at least the shop making a practice of employing them finds that the workmen prefer them, which in itself is a recommendation that would not be given without being backed up with reason.

As many of our foundries are operated in connection with machine shops, it would take but a small outlay to test the claims of the efficiency of cast iron for this purpose. It is said that these tools, while proving superior on the softer metals, are unsuitable for working steel, a statement we can readily understand when we consider that the weakest metal must give away. The readiness with which tools of different shapes may be made, and the general cheapness of the process, are the advantages claimed. A careful investigation may prove the extent of their merit, something that may not have been thought of before.

Why American Machinery Leads.

American makers of machine tools have long been active and formidable competitors in the markets of Europe, but the recent invasion of England with tools for making bicycles has caused alarm. Many special tools were exhibited at the recent National Cycle Show and attracted much attention because of their accuracy, their efficiency and the ingenuity of their design. One of our English contemporaries, says the *American Manufacturer*, devotes several pages in two different issues, to descriptions of some of these tools, and says that the Americans are reaping a rich harvest by selling, pretty well at their own price, special cycle-making tools which cannot be bought of British makers. The editor undertakes then to explain why the American has shown so much more promptness and originality in seeing and meeting this demand. He thinks it evident that the English mechanic could have made the machines if he had thought of them. But why did he not think? That seems to be largely a sociological matter. The control of English works, making machine tools, is largely in the hands of prosperous men who send their sons to schools where mechanical ingenuity is unhonored and where the important knowledge seems to be the politer branches of learning. The young man so trained passes a little time in the shops, where he sees designing entirely in the hands of subordinates, and where the notion is confirmed in his mind that designing is a subordinate part of the work of the concern; and so he gradually takes the business control of the establishment with such theories well fixed in his mind.

In order to give to projectiles of steel or steel alloys a special hardness at certain places, at others and in the interior a special tenacity, they are heated, according to Louis Grambow of Berlin, at the places to be hardened to a bright red, corresponding to the hardness desired. The other parts are heated only to such a degree of red as to preclude their hardening in the subsequent tempering process. This treatment may be preceded by a heating of the whole projectile to a shade of red not sufficient to cause a hardening and a tempering of the whole projectile in order to make it tough throughout. Both treatments may be preceded by a hardening of the whole projectile by heating until the crystalline structure disappears, and then tempering all over afterwards. In partial hardening the projectile can be subjected to the different temperatures in a furnace by covering the parts to be least heated with sand or clay, or heated gas currents can be used for heating the single parts, the flames playing through open spaces in a flask enclosing the projectile.

DR. DEKARMET, the eminent Russian lecturer, who is at Vancouver, B. C., to give addresses on Siberia and its prospects, declares that with the opening of the Trans-Siberian railroad there will speedily follow direct and rapid steam communication between Vladivostock and Vancouver. This would place British Columbia in an all-around-the-world route that could be traversed in forty days. Dr. DeKarmet expects the Canadian Pacific railroad to join in the work of developing this great route by land and by sea. He predicts that with the opening of the railway there would come such vast gold development in Siberia as would make that country one of the greatest gold producers in the world. Even now, with but primitive appliances and methods, it produces in the neighborhood of $29,000,000 in gold yearly.

THE Schenectady Locomotive Works are building engines for the Northern Pacific railroad which will be the largest locomotives ever constructed. Some of their features are: Cylinders, 23 by 34 inches, 30 inches stroke; boilers, 72 inches in diameter at the smallest ring next to the smoke box; five driving wheels on each side; working weight, 100 tons. The fire-box sheets, 123¾ inches by 73¾ inches, and half an inch thick, had to be made in two pieces, with a lap joint.

A COMMISSION sent out by the German Government has made a report in which American and German railroads are compared, with little favor to the latter. There is nothing in all Europe, the Commission reports, to equal in running time and comfort the service between Chicago and New York. Comparisons of rates, arrangements of equipment, and accommodations all show in favor of our roads.

THE North German Lloyd line has in course of construction and remodeling steamers amounting to 70,000 registered tons. Seven ocean steamers are building and one remodeling, and a number of tugs are in course of construction. The largest of the ocean steamers will have 13,800 registered tons, another 12,500, and three others each 10,500. The work is all being done in German shipyards.

WHEN the Union Pacific was built the company paid $130 a ton for its iron rails, delivered at Omaha. Last week it purchased 30,000 tons of steel rails, to be delivered at Omaha, for $18 per ton.

Practical Information.

Reckoning Time Simplified.

Deputy Etiennes intends at the next meeting of the French Chamber to offer a decimal subdivision of time for universal adoption, as described some time ago.

The day is divided into 10 hours, the hour into 100 minutes and the minutes into 100 seconds, making 1000 minutes, or 100,000 seconds, per day.

The hour hand always points in the direction of the sun. Consequently, as the day begins and ends at midnight, the hour hand points downward, as also do the minute hand and second hand, at the exact time of the change of day, or 10 o'clock. Thence it rises with the sun in its apparent motion around the earth, points to the zenith at noon, after which it descends until it reaches its extreme lower point again at midnight. Thus the hour hand makes but one revolution around the dial each day. It is then the figure X on the dial at which the hour hand commences and ends each day, the minute hand each hour and the second hand each minute.

The time indicated by the decimal clock is always positive time. While 6 o'clock A. M. is represented decimally by 2:30 o'clock and 6 o'clock P. M. is represented by 7:30 o'clock, noon is represented by 5 o'clock and midnight by 10 o'clock.

It provides a standard time for the entire globe. It is proposed to divide the terrestrial globe into 1000° of longitude, corresponding with the 1000 minutes of the day, and by grouping them into twenty sections of 50° each establish standard time for the whole world.

Giving to Greenwich, where the counting of the meridian begins, the midnight meridian, and making it 1000°, the twenty sections would all be reckoned east of Greenwich and all the way around the globe.

It is said that this decimal system of time originated in America, being the invention of a United States citizen, although probably the French will be the first to recognize and adopt it.

A New Metal.

Wilfred van Wart, Franz Popp and J. J. Bradley, Birmingham, England, after several years of experimenting, have discovered a new silver-colored metal of beautiful appearance and of great strength. Mr. F. W. Burstall, professor of civil and mechanical engineering at the Mason's Science College, Birmingham, has elaborately tested tubes made from this new metal, upon the results of which tests the inventors claim that their new metal, which is to be called "vestadium," is very much stronger and of far greater utility than any other metal of the same specific gravity at present known. Vestadium is an alloy of aluminum, with a specific gravity of 2.73—that is, about one-third the weight of steel of the same volume—and is, therefore, of about the same specific gravity as pure aluminum, which is the lightest metal in mercantile use.

The following is one of the tests made by F. W. Burstall: "A tube, 12 inches long, was fixed with one end against a support and pressure applied to the other end; the tube only commenced to yield when a pressure of over 4800 pounds had been applied, and was only very slightly crushed at a pressure of more than 5000 pounds. One of the great advantages which these tubes possess is that they never snap. In the whole of the twelve tests made the metal was found to be homogeneous, and in every case the fracture was clean and silky. Vestadium is non-corrosive, the atmosphere and water take no effect upon it, and sulphuric acid does not even mark it. In color it is whiter than silver and takes a magnificent polish which never tarnishes and requires no cleaning. It can can be used with the greatest advantage in all trades, and for articles for outdoor and household use it is specially suitable, as it requires practically no cleaning, which is, of course, a great saving of labor.

THE cutting of ice in Wisconsin for market is described as follows: A field of good ice, the thickest, cleanest and purest on the lake, is selected at the start for domestic use. This is then "laid off," and next the snow is removed by immense iron scrapers. It is then scored by horse power into squares which will produce blocks, or cakes, nearly 2 feet square, each weighing 225 pounds. A team of horses, drawing a sharp, thin ice plow, then goes over the field, following the scored lines and cutting into the ice to a depth of 5 or 6 inches. A heavier plow follows, making the cut 10 or 12 inches in depth. Then, by means of long saws with double handles on one end, workmen go over the same field, sawing entirely through the ice at distances of 12 or 16 feet, as desired, and to the width of four marked cakes. These large sections of ice are then taken charge of by a crew of men under a foreman, and with long, hooked poles the men "steer" the sections toward the channels of open water which lead to the ice houses, channels which are in some instances a mile or two long.

THE most prominent feature of the metal markets for several years past has been lowering prices, but in no line has this tendency been more strongly shown than in the aluminum trade. A look over the prices quoted for some years past shows surprising figures. Throughout 1893 No. 1 98 per cent aluminum in ton lots sold for 75 cents per pound. A year later the price dropped to 65 cents and in 1895 the price quoted was 58 cents. Last year 50 cents per pound was the average figure, but since the opening of 1897 a decided lowering of rates has occurred.

A WATER-TUBE jail is one of the latest achievements of ingenuity. It is no longer necessary to make the prison bars so heavy and so hard that cutting through them becomes very difficult; but, instead, they are made simply of pipes, forming part of a high-pressure water system. Should any of these pipes be severed, the water would escape and quickly give warning of the break.

AN expedition is to be sent out shortly to northeastern Asia and northwestern America. M. Jessup will pay all the bills connected with it, which during the six years of its continuance will aggregate $50,000. F. W. Putnam of Cambridge, Mass., has the general direction of the expedition, which is to determine whether or not the primeval American Indians and Esquimaux came from Asia originally.

AN explorer says that the Missouri's source is at the crest of the Rockies, 8000 feet above sea level, just within the boundary of Montana. The stream is two feet wide and two inches deep, its water coming from melted snow. The source is 4221 miles from the Gulf of Mexico and 2945 miles from its confluence with the Mississippi, making the river the longest unbroken current in the world.

THE earliest discovery of iron within the present limit of the country was in the mountain range of western North Carolina, and the first effort to manufacture it into merchantable form was made in the State of Virginia in 1619. The foundry was destroyed by the Indians in 1622.

GOOD sponges have steadily grown dearer of late years, and now the Cuban insurrection cuts off one source of supply. Since the rebellion so many of the fishermen are forced to serve on board ship that there are few left to go fishing.

THE French Minister of War lately offered a prize for the swiftest bird in a flight from Perigueux to Paris—310 miles. There were 2746 entries, and the winner did the distance in seven hours and thirty-four minutes.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: The Union Consolidated gold mine has not closed down. At the suggestion of Supt. Bibo all the men working in the drift and stopes were laid off and more men put in the shaft. The intention is to discontinue work in the drifts and sink on the ledge 300 feet which will make the shaft 830 feet deep.

At the Bellwether a small force of men is keeping the water out, and in running north along the ledge at the 280-foot level. It is expected that the full force of men will be put on soon again and that the shaft will be sunk to a greater depth.

Under date of March 13th, Louis C. Tetard, secretary Bellwether G. M. Co., writes from Chicago, stating that the item concerning the company's business, which appeared in this column on the 6th inst., was incorrect. He says that no man in the employ of the company was ever told that he must buy 100 shares of stock at 25 cents per share; that no stock was so issued, and no money thus retained. Mr. Tetard states that he owns and represents nine-tenths of all the company stock, that none of this is on the market at any price at this time, and has not and will not be advertised for sale.

Republican: There is no doubt that the erection of a 40-stamp mill will be commenced on the Argonaut as soon as the weather settles. The mine is looking remarkably well. The ore body has been penetrated and to some extent prospected on three levels—namely, 1150, 1250 and 1350.

Record: At the American mine on Sutter creek the new stamp mill was started last week by Wilifred Dennis. In the bottom of the 70-foot shaft the vein is 8 feet wide.

Work has been resumed at the Black Prince mine, Mount Echo district, and the machinery has arrived. Machinery for the Leona mine in the same district is on the road.

Butte.

Mercury: At Magalia a new and promising enterprise is the Bader mine, one and a half miles southwest of town. It is a location on an ancient river channel, and the company own 110 acres. The channel beneath a lava capped mountain 500 feet high is being developed by a bed rock tunnel which was run 800 feet before gravel was struck by raising twelve feet. The channel is believed to be in the neighborhood of 200 feet in width, and where breasted out, is about 3 feet deep.

The Gold Bank mine at Forbestown is a large ledge of low-grade ore, but by a systematic system of working, and a complete and extensive plant for reduction, has paid dividends quite regularly—notwithstanding the immense amount of dead and developed work which has all the time been prosecuted, since it was started. The hoisting, pumping and milling is done by means of water power, using 150 inches under about 200 feet pressure.

The Golden Queen, an adjoining mine has been leased by the Stow Company, from which the rock now being worked is extracted, while the development work in the lower tunnel is being made.

Three miles west of Forbestown, on the South Fork of the Feather, J. Chamberlain is superintendent of the New Oregon, for a San Francisco company, and is meeting with flattering prospects. The ledge is 12 feet wide.

On the hill above Forbstown is the Burlington Consolidated, owned by Ralston & Co. of San Francisco. A drain tunnel has been pushed ahead for some distance on the vein, and at the face of the ledge is 10 or 12 feet in width.

The Missouri ledge, a mile north of town, has been bonded by a Texas company, and is being prospected under the superintendency of Mr. Stow of the Gold Bank.

In the Carlisle mine, northeast of town, the vein is large and carries a heavy percentage of high-grade sulphurets. It has a 5-stamp mill. In the same claim there are two other large veins, yielding a good grade of quartz. The owner is now engaged in preparing for extensive work this season.

Hampton & Martin own a ledge two miles southeast of town, which, with a shaft 40 feet deep, shows a 4-foot vein.

There are thirty-three drift mines in Butte county, sixteen of which are being worked more or less extensively, employing in each from one or two to eighty men.

There are forty-five quartz mines, partly or extensively opened. Of this number thirty are working, employing from one to 110 men.

Calaveras.

Prospect: At the Big Six mine in Salt Spring valley, owned by D. L. McAfee, W. K. Dean, R. N. Dean, J. McAfee, P. S. Dean and Chas. McCoy, two shafts have been sunk, one about 10 feet and another 40 feet, and the vein is 14 feet in width between the two well-defined walls.

The working tunnel which is being run by the Exploration Company in the Gottschalk mine has connected with the crosscut and the latter is being enlarged to the size of the tunnel. The crosscut is about 80 feet long, and as soon as it is enlarged to correspond with the working tunnel, sinking on the vein will commence.

Chronicle: At the Gwin mine the 40-stamp mill is running night and day and crushing at the rate of 115 tons every twenty-four hours. The lead at present is from 8 to 10 feet wide of an excellent quality of ore. There are at present eighty-four men employed in and around the mine.

Mountain Echo: A rich chute of ore has been discovered in the Bald Hill mine at Albany Flat, owned by Fred Brunner. Mr. Brunner was about to bond the mine to parties when the discovery was made, and thereupon changed his mind.

A corps of engineers has made a survey of the north shaft of the Ford mine at San Andreas, with a view of connecting it with the south shaft.

Active operations have been resumed at the Green Meadow hydraulic near Glencoe by W. Clark. The claim comprises sixteen acres.

The Fellowcraft mine will start up with a full force of men. The revival of the operations at this mine is regarded as an important proposition by those interested in mining. It was opened last spring under favorable circumstances. A 10-stamp mill was erected and the prospects for a good mine were encouraging. After a short time operations ceased and the property has remained idle up to the present time.

The Rose Hill Hydraulic Mining Company, recently incorporated in San Francisco, will work the Rose Hill mine.

El Dorado.

(Special Correspondence).—The Point Lookout mine, situated five miles south of Shingle Springs and twelve miles west of Placerville, was sold last week to Bassett & Smith, of Pomona for $60,000, of which amount $20,000 are payable in sixty days. The ledge is 15 feet wide at a depth of 50 feet. The ore averages $8 in free gold and $150 per ton in sulphurets. There is a 4-stamp mill on the property.

The tunnel on the Lloyd mine, one-half mile from the Court House, has reached 135 feet. It is 5x6½ feet in the clear. The work has crosscut the formation of a ledge 20 feet wide, of which 8 feet are mineralized. The formation is locally known as greenstone. Power drills and systematic efforts are accomplishing their work very rapidly.

Meyers & Morrow, three-fourths of a mile north of town, are working successfully on the Lucky Star, which joins the Gentle Annie property on the east. They have a shaft 35 feet, tunnels 240, and open cuts 160 feet in length. The ledge averages 2½ feet, and is a porphyry quartz. The general average of the ore is $20 (with very rich sulphurets), but from this rich specimen ore is hammered in a mortar, so rich that its quality was beyond belief had the writer not been an eye witness.

A visit was made last week by your correspondent to the old Skinner, Noyes & Lemmon property, now known as the Empress Josephine mine. It is less than half a mile from the court house. The tunnel has reached 245 feet. The drift to the north has reached 15 feet on a ledge 14 feet wide, the opposite wall of which has not been reached. The gold was plainly visible, not less than 15 ounces being taken out with pick and gad within half an hour, and what clung to the quartz was gathered on a canvas spread across the bottom of the tunnel. It is argued by some that this must be a pocket proposition exclusively, yet it should be borne in mind that the ore is all gold bearing, and will average above $8 (free milling), and from $100 to $150 per ton in sulphurets. The slate, as well as the quartz and porphyry, carry gold, visible without a glass. For years this property has been gophered, and yielded a large amount of gold, but now system and depth are proving that a good mine is in reserve. El Dorado county is now being rapidly redeemed from its dormant state.

Placerville, March 16th, '97.

Nevada.

Transcript: Some very rich quartz has been struck on the 600 level of the Pittsburg mine by tributers. Twenty men are at work there.

Charles Bell of San Francisco and W. H. French of San Jose have purchased the old Crumbecher mine in Washington district and intend putting up a mill as soon as the snow goes off. The average of all the samples taken for 53 feet in width was $5.40 per ton, and the sulphurets assayed $50 per ton.

Prof. Treadwell has received a letter from London capitalists who have been considering the big tunnel proposition from the South Yuba river to the Nevada City and Grass Valley mines, in which they state they must have all the Gold Bank Tunnel interest and the control of the Grass Valley Railway & Tunnel Company. They want to consolidate to forestall any opposition. If reasonable terms can be arranged, they contemplate the purchase of some desirable gold mining properties along the line.

Placer.

Sentinel: J. G. McCloud, of Clipper Gap, has bonded his Big Lead quartz mine on Rich Flat, near Auburn, to Joel Smith for $20,000. The life of the bond is eighteen months. Mr. Smith has engaged four miners and will immediately commence to sink on the ledge.

Argus: At Blue Canyon the Van Avery mine has been closed down for the time being, the snow having shut off the water supply which operates the mill.

The Azalea mine is running in full blast.

The Redstone mine was closed down for a short time.

The Haub mine, in Shady Run district, is shut down on account of too much snow.

The old Mountain Gate mine is being slowly opened up. Five men are engaged in retimbering the old gangways.

About a dozen men have been laid off at the Pioneer mine.

Herald: At the Marguerite mine they are now running a perpendicular shaft from a drift to the surface, and when the top is reached, a distance of 300 feet, they will go down again and enlarge and timber the shaft which they intend to sink 1000 feet. A hoisting works will also be erected.

Plumas.

National Bulletin: At Greenville, Standart & McGill have several men employed in their big mine near Round Valley. As soon as the snow leaves they will put on a larger force, begin the hauling of ore and resume the operation of their mill.

One of the big mining operations in this county now is the Plumas Imperial hydraulic mine, owned and operated by C. D. Hazzard, of Minneapolis. Since the 20th of February, two monitors have been running night and day continuously, and doing good work. The supply of water is plentiful, and will be for many months.

Sam Firmstone and associates are doing development work on the Phœnix, at the head of North Canyon, and expect soon to cut the ledge.

Shasta.

Democrat: Bell and Scranton are getting out some good ore from the Oro Fino mine they recently bought from A. K. Fitch, and which was formerly owned by Judge Sweeny.

Conroy, Hull and Murray are shipping ore from their mine four miles north of Shasta to the smelter at Keswick.

C. E. Brown and many others are also shipping ore to Keswick. The deadly fumes from the smelter are beginning to tell on the timber near Shasta as well as along the Sacramento river. For quite a distance north and west of the town the hills are covered with dead trees.

Siskiyou.

Journal: The Brown Bear quartz mine, of Salmon river, owned by Golden & Eveleth, has been sold to G. W. Grayson of Oakland, Cal. It will be worked upon an extensive scale as soon as preparations are completed.

The Chinese company, just above the mouth of Humbug creek, in Klamath river, have their wingdams and wheels ready to commence work, except the dip wheel for the sluices, which is now being built.

The Greenhorn blue gravel mine will soon be open for hoisting pay gravel, as the shaft is now down about 90 feet, with expectation of sinking 15 or 20 feet more to reach bottom of bedrock.

Lively times in mining may be anticipated during the coming spring and summer around and near Yreka. The old Espy claim and pumping machinery is now in successful operation under control of Hunter and Simmons, who have already piped off more than an acre of ground, since starting their mammoth pump at Shasta river. Several good claims have been located on Shasta river below the electric light plant, in Fool's Paradise district, and all the old claims are to be worked with renewed energy at Hawkinsville, Long gulch, Canal gulch and other localities north of town. On west side of town several claims will be worked on Humbug gulch, Greenhorn gulch, Portuguese gulch, Spring gulch and other gulches, while south of town, the rich claims on Greenhorn creek are being opened again.

Reporter: S. J. Fore has purchased a sawmill and five stamps to be added to a 5-stamp mill now being moved to his mine. The present tunnel now shows 40,000 tons of ore in sight. Mr. Fore will also have his mine at Callahans running by the 20th inst., where thirty men are now employed.

News: Ed McNulty is surveying a ditch from near the electric light plant, extending four or five miles down the Shasta river to rich placer ground he has located, which lies on both sides of the river.

Under the new arrangement the Ball mine in Klamath mountain will be started up soon with its 20-stamp mill.

Sierra.

Enterprise: Last week fine appearing blue colored gravel was struck in the latest upraise of the North Fork drift mine. The boulders encountered are large and well washed. Pretty gold specimens, some rather heavy, were picked out of the gravel near the bed rock. Quite a number of miners are employed and the future success of these old-time diggings is now assured.

The Bald Mountain Extension's north tunnel, being run for the channel northeastward, was in 432 feet last week. This only leaves 413 feet more ahead to reach gravel in upraises Nos. 15 and 16. The rock in the face of the tunnel is very soft and over 40 feet is the weekly (six days) progress, with two ten-hour shifts working.

Should the Plumbago ledge continue to pay well, a telephone line will be put up to connect with that of Alleghany and Forest City.

The mining outlook at and in the vicinity of Alleghany is again brightening.

Trinity.

Free Press: The Trinity Mining and Milling Company, having its office at 56 Nevada block, San Francisco, has been incorporated, with Charles H. Fish as president and J. Stadtfeld Jr. secretary. The properties to be operated are the Trinity Consolidated mines in Dog Creek mining district. It has long been known that these mines possessed great values, but for want of sufficient capital and machinery have heretofore been worked in a desultory manner. In the early 60's this camp produced great quantities of placer gold, but until lately quartz mining has not received much attention there.

Journal: The Pelletreau claim, at Taylor's Flat, 400 feet above the river bed, comprises about sixty acres of rich gravel. At present it is running night and day, and gives employment to eight men and pays $500 a week.

The Don Juan mine, situated about three miles above Burnt Ranch, operated by Mr. G. W. Huestis, is paying well.

At East Fork the Enterprise company are running their mines and crushing ore from the Lone Jack ledge with good results. The North Star mine is being run, and the ore crushed in the 10-stamp mill on that property. Nicholson & Cleckner are taking out quartz from the Poorman mine and having it crushed in the Enterprise mill.

Tuolumne.

Union-Democrat: Work on the Marlow mine, near Summersville, is being prosecuted vigorously. This is a gravel claim and indications are that it is rich. Twelve men are employed.

The Trio is being driven down by Acting Superintendent Munger, although progress is rather slow owing to the extreme hardness of the rock. The shaft has reached the 120-foot mark and on arriving at the 200 the vein will be crosscut and a level run.

At the Dutch a strike of rich quartz was made in the drift on the 300-foot level Sunday.

The Sailor mine, a Table mountain proposition, owned by Kent & Dick, is in the main channel, with 700 feet of tunnel, and sending out blue gravel which pays well.

A 5-foot vein of rich ore has been uncovered in the Norwegian mine, near Robinson's Ferry. The mine was recently purchased by H. F. Emeric of San Francisco and others from the Lawsons, whom it has made independently rich. Frank Enzensberger was placed in charge as general manager and under his directions work on the property has progressed rapidly.

On the Golden Gate they are driving the 200 level northward into the hill to reach a large pay chute which, from surface indications, exists in the upper claim of the group. The chute on which the mill is running is over 650 feet long and the mine opened to a depth of 700 feet. No ore has been extracted below the 500 level and it is said that the reserves still in sight above that level are sufficient to supply the mill for a long time. The number of men employed is about seventy-five. Mr. Jacob A. Fischer, the general manager, is at present personally superintending affairs at the mine.

NEVADA.

Dayton *Times*: Rapid progress is being made on the Davis leaching plant. It will consist of five large redwood tanks, 20 feet in diameter and 5 feet deep, and two redwood settling tanks, 16 feet in diameter and 8 feet deep. The plant is so situated that the material to be worked will be hauled onto the runway over the tanks and dumped through screens into the tanks. When the material has been treated the solution will be drawn off into the two 16-foot tanks and the waste will be discharged through a flume, under the Rock Point ditch, into the river below the dam. The plant will be of a capacity to handle between fifty and sixty tons of material a day.

It has been found that the Douglass ditch will have to be enlarged some 2 feet to furnish water enough to give sufficient power for the Peck plant which is to be put in here. To enlarge and clean the ditch thirty men have been employed, and work will begin immediately.

OREGON.

BAKER COUNTY.

The Virtue, the oldest mine in the district, was discovered in 1864, and has the credit of producing over $3,000,000 in gold. The mine was developed to a depth of 700 feet, the ore now going to the mill coming from 300, 470 and 600-foot levels. It is the intention of the company to put in twenty more stamps this season. The new hoist and pumping plant, just installed, have a capacity for developing the mine to a depth of 2000 feet. The main pay chute is 800 feet long, and averages 3 feet in width.

The Consolidated Virginia is the southern extension of the Virtue. The shaft is now down 415 feet, and in very hard diorite. It is expected that forty days more will be used up in the shaft before they are ready to crosscut for the lode.

The Flagstaff, northeast of the Red Jacket, is in the same ore belt. This mine, owned by a French company, has a fine steam hoist, eight compressed air drills and plant, and has just finished a 10-stamp steel mill of the latest improved pattern. The shaft is now down 550 feet, and will be pushed to a depth of 800. Drifts have been run at the 100, 200 and 300-foot levels, exposing an ore chute from 200 to 400 feet long and of good quality. The mill will be started as soon as the water supply has been increased a little.

The White Swan, three miles east of the Virtue, at this date is held by persons who are reorganizing the company, and hope to drive away the cloud that has hung over the mine so long. The mine has a record of over $30,000 in gold, all from above the 240-foot level.

The Columbian mine is two miles northeast of the Virtue. The incline is down 225 feet, and the ore has been drifted at the 100 and 200-foot levels. The steam hoist has a capacity of 800 feet. Here it will be necessary to sink for water, and a 10-stamp mill will be erected as soon as water is reached.

The Mabel mine is 2½ miles southeast of the White Swan. The ledge is from 1 to 6 feet wide, and from one pocket there was taken some years ago $24,000. No work has been done for some time.

BRITISH COLUMBIA.

(Special Correspondence).—In a short time an act will have passed the Provincial Legislature making it compulsory for a mining company incorporated after that date to put up 10% of the capital stock of the company in cash. For this reason in the past two weeks eighty-two mining companies have been incorporated with an aggregate capitalization of about $65,000,000. This brings the total capitalization of British Columbia mining companies up to over $500,000,000, and a very small proportion of this represents actual cash investment.

Trade centers are commencing to feel the injurious effects of over-speculation in stocks. Many business men of small means have exchanged available cash for stock not profitably negotiable just now, and collections are very slow in consequence, while in the rural districts it is impossible to collect even a small percentage of taxes due owing to moneys available being appropriated for mine investments.

No less than three mining towns are being sold by sections in Vancouver. All are in a very incipient state as yet, but bid fair to become settlements of importance. They are Channton on Phillip's Arm north from Van-

couver, near the Channe Mining Company claims, recently sold to an English syndicate, Cachton, near the famous Golden Cache mines of Lillooet, and Fairview, about a mile from Fairview camp, Okanogan.

Five syndicates in all have asked permission under certain conditions to build a smelter and refinery in Vancouver. Four of them want big bonuses ranging from $100,000 to $150,000, but an English syndicate offers to build a smelter and refinery, expecting no more inducement than free city water and tax exemption. It is altogether likely that the English syndicate, being the lowest bidder, will build the smelter.

The Aurious, Marguerite and Nanaimo claims in Lillooet, near the Golden Cache group, have at last been put on the market, having been acquired by the Lillooet Gold Reefs Company. The mines have been capitalized for $200,000, and shares are selling at 25 cents par. The ore is free-milling and resembles the Golden Eagle ore. Assays from the surface run high in gold.

Every one is anxiously looking forward to the issue of the first dividend from Seaboard mines. Several of the mines from Vancouver's very door to within a radius of 300 miles have been shipping ore, but none of them in large quantity. From the result of the work at the Alberni Consolidated, Vancouver island, however, there is every indication that the coast proper will soon have a dividend payer. A stamp mill has been running night and day, and, according to report, the ore turned out $50 to the ton from rock taken at random across the lead. This week ten tons of ore were shipped to San Francisco to have it properly mill-tested, and, should the result be favorable, a 20-stamp mill will be erected.

The Dominion Developing Company shareholders have decided to reduce the capital stock of the company from $500,000 to $22,500. The move is a very popular one in these days of over-capitalization.

The latest excitement is caused by the location of large numbers of promising gold and silver claims in the neighborhood of Pitt and Harrison lakes respectively, and within easy reach of New Westminster and Vancouver via the Fraser river. At Pitt lake fifty prospectors have located over 100 claims and many of the first assays show rich in gold. Access is cheap and easy by water to the Everett smelter, to which the mines will probably ship most of their ore. Several will begin shipping in early spring.

The mountains around Cayoosh creek, near the Golden Eagle, are being scaled by hundreds of prospectors who are staking claims in the snow. The country is all staked out within a radius of several miles from the now famous Golden Cache mines. The reputation of this camp is now so widespread on account of the Golden Cache mines that numerous companies are rapidly being formed to procure and take up claims now on the market. Among the best companies organized is the Lillooet Gold Fields Mining and Milling Company, organized to develop the Aurious and Marguerite claims, near the Golden Cache group. The capitalization is low—$200,000. The ledges on the claims owned by this company have been stripped in several places and average assays from the surface run about $15 in free-milling gold, with every indication of improvement.

The owners of the Van Anda mine, Texada island, are well satisfied with the latest reports from the workings. The 110-foot level of this Texada island mine has cut a vein showing rich peacock ore, and on the 70-foot level the ore continues well defined and much stoping is being done, there being considerable ore now ready to ship. Sixty tons will be shipped at once to the smelter. Meanwhile the Raven, two miles from the Van Anda, is showing fine peacock ore at the bottom of the shaft and the Victoria has a shaft down 70 feet and the ore continues well. The mines on Texada island are now attracting general attention to the coast. Texada has for long years been known to be richly mineralized, but only recently have attempts to exploit its ores materialized. Now prospectors have located very many promising claims all over the island.

The Queen Bee and Bully Boy claims on Valdez island, which are being worked by a Vancouver syndicate, show encouragingly. The shaft on the Queen Bee is down 34 feet, where average assays show $43 a ton. The ore carries gold, with a trace of silver. On the Bully Boy a tunnel is in 60 feet, showing ore similar, but not quite of such good grade, as in the Van Anda case. There are sixty tons of ore on the dump.

The Fairview Consolidated Quartz Mining Company, Limited, incorporated for $2,500,000, will acquire the Reco, White Swan, Quartz Queen, California, Standard, Nightingale, Ocean Wave, Sundown, Ironclad, Fannie Morris, Silver Bow and Rob Roy claims in the Fairview camp. Of this and several other Fairview mining companies Mr. A. A. Davidson of Victoria will be the managing director. There will undoubtedly be large developments in the Fairview camp this year, although until recently development has been comparatively slow.

The iron ore of Nanaimo and Texada island has been but little worked yet, and this only for the supply of blast furnaces at Port Townsend, Wash., now closed down. It is, however, now hoped that, in conjunction with the coal of Nanaimo, the working of this iron ore may be resumed, in connection with iron blast works within the Province itself.

Victoria, March 16, '97. GOODMAN.

Spokesman-Review: Sir James Grant of Ottawa has obtained R. C. Campbell-Johnson's option on the Exchange group in the Slocan. The option is said to be for $21,000.

Spokane *Chronicle*: A good strike has been made in the Center Star mine 200 feet from the Le Roi line. The main tunnel in the Center Star, which is almost 1500 feet long, reached the Le Roi several days ago. Manager Durant then began crosscutting both ways about 200 feet from the Le Roi line, where a good shoot of ore had been cut diagonally. The crosscut to the south is in 6 feet and shows no sign of the foot wall of the ledge. The crosscut to the north is now 24 feet long and shows no sign of the hanging wall.

The new air compressor at the Slocan Star has been set up and the drills are now cutting the remaining 450 feet the No. 5 tunnel has to reach the vein. When completed the tunnel will be about 900 feet in length and about 600 feet from the surface. The mill is turning out thirty tons of concentrates daily. The monthly pay-roll shows an average of over 100 men employed at the mine and mill.

On Pass creek, a tributary of the north fork of Kettle river, the Pathfinder was bonded a short time ago by Parkenson & Peffer to English parties for $65,000. The shaft is down 30 feet and shows $21.50 in gold and about $10 in silver and copper.

ALASKA.

News: Reports have been brought from Funter Bay of the recent developments in the War Horse group of claims, in whose veins the telluride ore has been proven to exist. The ledge upon which the greatest work has been done crops out near the water's edge; in fact, is covered at times by the highest tides of the month. The shaft is now down to a depth of 44 feet, disclosing an 18-inch vein of exceptionally rich ore. Leading into the main ledge are numerous stringers varying in width from 2 to 8 inches and all showing the same general characteristics.

The Klondiek will not be the only scene of activity on the Yukon this season. The Birch creek diggings will turn out more gold than ever before, as many claims are now opened up for the first time, while the old producers are in a correspondingly further advanced stage of development and able to keep up the record established in years past. On Mastodon creek alone, which contains all told but fifty-two locations, about thirty-five claims will be worked continuously during the summer.

UTAH.

Tintic *Miner*: A strike of ore has been made this week in the Alaska shaft at a depth of 130 feet. The vein is said to be nearly 4 feet wide.

At the Centennial-Eureka C. E. Allen, with Superintendent Smith, is conducting a thorough examination of the property, and will, in short time, decide on the capacity of the projected mill. It is said of the Centennial-Eureka that already blocked out are ores that will keep the mill operating for several years, with 200 tons a day being put through. Meanwhile additional depths are being explored; practically no stoping is being done.

Salt Lake *Tribune*: At Park City stoping in the Daly has been resumed. The ore will be stored in the drifts, which are mostly empty, and the men will go to and return from work through Daly No. 2.

At the Anchor considerable first-class ore is being stored ready for shipment as soon as the roads will permit its being delivered at the Mackintosh sampler.

At Mercur the Marion has resumed work with the old force, and the usual amount of ore is being put through. At the Geyser between 97 and 100 tons are put through daily, and the crusher is not busy half the time. The mill will soon be treating the full 100 tons, and as soon as the weather moderates tanks sufficient to bring the daily capacity up to fifty tons will be put in.

The Wachussetts, consisting of two claims on Lion Hill, has been sold for $20,000, to Dern, Airis, Brown and Peyton.

Mammoth *Record*: The old Diamond mining property has been started up again.

The Mammoth Mining Company have their new hoist in position, and will start work immediately.

Eureka *Democrat:* For the past eight months a series of experiments has been made at the Eureka-Hill with a view of adapting the leaching process to the working of the ore being taken out of that property. The ore can be treated at a considerably less figure by this method than at the smelters, and will enable the company to work lower grade ores.

Mr. Schwarthorn sent out a force of men from Provo this week to work the Last Hope, which lies on Mineral hill, on the east slope of Godiva mountain.

Arrangements are being made for the incorporation of the Orient Mining Company, which will develop some promising properties in West Tintic.

Thomas Barrett put ten men at work on Monday on the Lily Consolidated.

A force of men will be put to work on the Valley View, near Silver City.

IDAHO.

Wardner *News*: It is not expected that the Helena-Frisco mine at Gem will be ready to start up full blast before the first of July. Nearly a hundred men are now employed in sinking, cutting out stations and other preparatory work. This property is being fitted with the most complete and up-to-date mining machinery in existence. Manager McDonald estimates that not over 120 employes will be required to operate the entire property when the work and improvements now in progress are completed.

The Frisco shaft is now down to the 600-foot level. Good headway is being made in the drifts. One hundred men are at work. No ore is being milled at present.

A new strike is reported on Moon creek, west of Osburn, on a property now under bond and lease to McCallum & Co. The ledge is good and strong.

The Tiger-Poorman Company has 135 men at work. Sinking is being done on the shaft, and the station for the 1200-foot level will be started soon. The mill is turning out about forty tons of concentrates per day.

The Standard is employing 140 men at the mine and mill. All stopes on the Campbell tunnel level show fine bodies of ore. About 250 tons are sent to the mill every day, and it is expected the mill will oe running full time soon.

MONTANA.

At the Mayflower, shipment of ore is going on at the old rate. The company has started a tunnel 300 feet below the old workings.

Lacasse Brothers, owners of placer mines in Cedar guich, have sent men to begin work. Last fall a new flume was completed.

The Iron Mountain company have a telegram from the superintendent at the mine that the lead had been cut at the seventeenth level. The Iron Mountain is now the deepest mine in Montana.

Inter-Mountain: The chemical laboratory for utilizing the smelter smoke of Butte bids fair to become an assured fact. R. H. Hornbrook, a competent chemist, has been in the city several weeks looking into the matter and making tests at the Colorado smelter, and it is understood that within a few days work will be commenced on a plant to be situated near the Colorado company's smelter.

The shaft of the Parrott company has reached the 250-foot level, where it is likely a station will be cut and crosscuts run to tap the ledges believed to exist in that locality. No ore bodies have yet been cut.

Miner: Encouraging reports continue to come in from the Horse and Park Canyon districts, and there are now probably more men at work in this section than ever before in its history.

Elmer Metcalf and others have been given a lease on the Grant Extension owned by the Anaconda company. They are now sinking and at the same time putting in machinery. It is the intention to sink 200 feet before crosscutting commences.

The Ajax Mining Company of Helena has come into possession of the Stray Horse mine in Jefferson county, taking up the bond given last year for $75,000.

At the West Colusa of the Boston and Montana, preparation is being made for placing a head frame and sheave wheel at the 600-foot level, preparatory to sinking to the 900-foot. The size of the shaft will be 9x17 feet 8 inches in the clear, wall plates 12x12 inches timber, end and counterpieces 12x14 inches. This will allow two cars to be placed end to end on each deck of the cage.

At the Moonlight, crosscutting on the 600-foot is in progress. The shaft is going down steadily, being at present about 750 feet deep. At the Poulin, the shaft is completed in the 1200-foot level, where a station is being cut.

Mining and Railway Review: The heavy fall of snow in the mountains insures an ample supply of water for placer mining the coming season.

The Jaw Bone and Queen Bee mines at Hassell have been sold by Angus McQueen, of Helena, to an English syndicate, who propose to put it on the London stock board at a par value of $1,000,000.

SOUTH DAKOTA.

Black Hills *Times*: At Ragged Top, F. M. Wall is working fifteen men on his lease on Balmoral lodes No. 6, 7 and 8. He has driven two tunnels, each about 75 feet in length, from which he has run two crosscuts and an incline to intersect the fissure veins which are known to extend through the property.

Dacey & Kilpatrick Bros. have temporarily suspended all work except that of sinking the main shaft, in which eight men are employed. The shaft is now down 270 feet.

The result of operations of the diamond drill on the Alaska group, owned by General Raum, is of interest. Though a depth of over 200 feet has been reached, there is as yet no change in the rock or formation.

At Keystone the shaft on the Holy Terror has passed the 500-foot level, and a station will now be made and a crosscut run to the vein. The rock through which the last 50 feet has been sunk has been softer than formerly, and there are other indications that an ore body will be opened on this level.

Baldwin & Co., lessees of the cyanide annex to the Keystone mill, are making a success in the treatment of tailings and concentrates, and propose to handle the entire dump. The European expert, who is to examine and report on the property for an English syndicate, is expected to be in the camp next week.

COLORADO.

Denver *Republican*: At Silverton the Hamlet, on Sultan mountain, has been worked all winter and has developed a large body of pyritous ore, from which shipments will be made when the trail is opened.

The Sampson mine will be started up in the spring with a large force of men.

The Shenandoah, which has been worked all winter, has a body of galena and copper ore 12 feet thick with only the width of the drift taken out. When shipments commence, it can be broken down in large blocks and will give employment to twenty-five men.

The Victoria has 180 tons of ore taken out in drifting 100 feet on the new ore body, which will be dropped down to the mill when the latter starts.

The crosscut tunnel on the Letter B at Gladstone is now in a strong body of fine-looking quartz and the advent of paying ground is looked for within 50 feet.

The Idaho group of mines, on Kendall mountain, has been bonded to an Eastern company and will be in full operation when the spring opens. The property is extensively developed by tunnels on the vein. When the lower tunnel is extended to the end of Idaho No. 2, it will have attained a depth of 2500 feet; and as the outcrop is on the summit of Kendall mountain, the immense value of this deposit can be estimated.

The 400-foot tunnel on the Red and Bonita Mountain mines has been completed and a new contract on the same property will soon be commenced. Drifting on the veins is progressing. Nine veins were cut, most of which were blind on the surface. The veins all disclose mineral, but the main vein aimed for will not be reached until the tunnel is in 1000 feet.

On the Gunnison belt at Ohio City the Raymond, owned by D. H. Moffat and Eben Smith, is developed by a 600-foot tunnel. The vein is 5 feet between walls, with a 2-foot pay streak.

The mines in the district have been idle for several years, as they produced only silver at first, and it was not thought that they carried gold to any great extent. Recent developments, however, have shown that the gold values are continuous from the rich lodes of the San Juan region in a general northeasterly direction to the neighborhood of Pitkin.

The Little Chief is developed by tunnel work 450 feet in length, and has opened a vein of ore 18 inches wide.

The mining district contiguous to Lawson, up to 1880, was one of the best silver camps in the Clear Creek district, and before the exodus took place it employed fully 4000 men in its mines on these mountains. For a long time but little has been heard of Lawson, yet there is a portion of the Silver Creek district that has kept right on producing ore.

The Two Sisters group also employs about forty men. There are three shaft-houses on the property, and ore of a high grade has been shipped from here for many years.

On the Georgetown road, west of the Millington, the Bellevue is one of the greatest producers in the camp. The shaft is down 400 feet and is being sunk deeper as fast as three shifts a day can sink it. It has recently been leased and bonded to a Denver company.

At Telluride the Japan is making regular shipments of high-grade gold and silver ore. New stoping ground is being continually opened up, and after the mill starts in the spring, when there is sufficient water for milling purposes, this property will be one of the largest concentrate and high-grade ore shippers in Savage basin.

J. H. Schofield, superintendent of the Duquesne Gold and Silver Mining and Milling Company of Pittsburg, has men employed driving a tunnel on a group of properties near Ames. It is now in 400 feet, with about 350 more to drive before intersecting a big vein carrying gold and silver, which is the objective point of the tunnel.

On the K. C. Humboldt, located on the same lead as the Smuggler-Union and Sheridan-Mendota, a force of seventy men is employed, and from six to seven cars of high-grade gold and silver ore are shipped out per week. The ore runs well in gold, and some of the shipments have netted as high as $2000 per car.

In the Freshwater district the Hub Hill Gold Mining Company, owning fifteen claims on Hub Hill, near Guffey, is sinking a 100-foot shaft and otherwise improving.

The new cyanide mill is running successfully and proving its ability to treat the ores of the district. Two more propositions are pending to erect milling plants of not less than 200 tons capacity per day.

The Missouri Mining and Milling Company at Manhattan has struck the vein in the Whadbee tunnel in the Monte Cristo mine and find it 8 feet wide between the walls and well defined. The ore is apparently very rich. It is composed of sulphides carrying both gold and silver.

Reports from three mills treating Cripple Creek ores show 6500 tons handled by them during February. The Colorado-Philadelphia chlorination workings treated 3700 tons of an average value of $25. The Brodie handled 1387 tons, the extraction averaging less than $22. The Gillett chlorination mill treated 1300 tons of a total gross value of $35,000.

In February the Anchoria-Leland produced 600 tons of ore of all grades, paying the expenses and dividends, besides adding to the surplus. All the ore came from the first level on the Maloney cross vein, which has now been followed for 300 feet without disclosing the end of the chute. The new cross vein opened to the south of the big shaft has been followed for 30 feet.

The tunnel run to the Republic vein from Mayflower ground has cut the vein in 448 feet from the mouth, tapping the ore chute at a depth of 150 feet.

Sinking has been resumed at the main shaft on the Grouse of the Bankers' Company. A station was cut at 230 feet, and drifts are being run into the ore. In about 25 feet farther it is expected the vertical shaft will catch the vein on its dip, and from there the work is to be carried on as an incline on the vein to a depth of 500 feet.

The Squaw Mountain tunnel is being pushed on by hand, and at 1600 feet in the hill has encountered a new vein from which good assays are being had.

The lessees on the Estelline on Howell Hill have opened a vein in the north end of the property, and at a depth of 20 feet are getting assays from $6 to $18 a ton. The Westminster Company is negotiating with English capital for taking up the $85,000 bond on this property, due in July next.

ARIZONA.

D. B. Gillett, superintendent and general manager of the Gold Note and Surprise mines, has since commencing work on the mines, about June 1st of last year, up to February 8th done 2790 feet of work in sinking and drifting on the claims, all of the work being blasting ground. Included in the work on the Gold Note is a double compartment shaft which has been sunk to the 200-foot level and is well timbered and lined. Work will be resumed on the shaft the first of March and it will be continued to a depth of 500 feet, from which point levels will be run.

Nogales *Oasis*: For each hundred feet of the new four compartment shaft now going down on the Grand Central mine about 35,000 feet of timbering is required.

Development work was recently commenced on the South Verde mine, about 400 yards beyond the Verde.

The "Daniel Best" Crude Oil Engine.

Showing Improved Gas Generator for Using Crude Petroleum for Fuel.

In these days of fierce competition it is necessary, for all who hope to succeed, to reduce running expenses to the lowest possible point; hence by the use of a recently patented gas generator, to be used in connection with a gas engine, it is possible to use the cheapest grades of gas oils, such as crude oil, distillate, common coal oil or kerosene, gasoline or naphtha. It will furnish power at one-quarter the cost of steam power and at one-half the cost of power furnished by the ordinary gasoline engine, so that the "Daniel Best" crude oil engine will save any user of power a large per cent of his operating expenses, and will pay for itself in a very short time.

The reasons why the "Daniel Best" crude oil engine is superior to the ordinary gasoline engine are as follows:

First—It can use crude oil instead of gasoline alone, and is absolutely safe from explosions or danger of causing fire. Plunge a burning brand into a can of crude oil and it will be extinguished as surely as if plunged into water, but if you bring the burning brand anywhere near a can of gasoline there will be an explosion and a fire.

Second—One gallon of crude oil will furnish as much power with the "Daniel Best" engine as a gallon of gasoline will with any other engine made, and the cost of crude oil is about one-fourth that of gasoline. There is a refined lubricating oil left, when using a paraffine base, which is worth nearly as much as the first cost of the crude oil, so that the saving in fuel in operating the "Daniel Best" engine is by far the most economical power yet discovered.

Third—With gasoline there is a constant loss by evaporation, which is of course much greater in warm than in cold weather, and in hot weather this loss is very large, sometimes reaching as high as 50 per cent, while with crude oil (petroleum) there is scarcely any loss from this source.

Fourth—Crude oil acts as a lubricant as well as furnishing gas for power, and keeps the piston of the engine always lubricated, thus they do not wear as do the pistons of the ordinary gas engines using only gasoline or manufactured city gas; hence the "Daniel Best" crude oil engine is the more durable.

Fifth—While the "Daniel Best" engine will run with crude oil, it will also run with either city gas, gasoline, naphtha, common coal gas, or distillate, so that in case of one kind of fuel giving out any of the others can be used; and the "Daniel Best" engine, by the use of this newly improved generator, will get more power from a given amount of oil that will any other gas engine in the market.

From a test we made, the following table will show the comparative cost of operating a 5-horse power steam engine and a 5-horse power "Daniel Best" crude oil engine using gasoline, common coal oil, distillate and crude oil from Coalinga, Fresno county, oil wells, also crude oil imported from Peru, and based upon actual service of the above-named engines, running ten hours on each kind of fuel named.

The first test of the "Daniel Best" engine was on gasoline 74 gravity; second, cheap coal oil 110 fire test; third, distillate 40 gravity; fourth, Coalinga, Fresno county, crude oil right from the wells; fifth, Peruvian crude oil with paraffine base.

Cost of running 5-horse power steam engine ten hours:

Coal at $6.50 per ton	$1.13
Engineer	2.25
Lubricating oil	.15
Boiler compound	.05
Kindling for starting fire	.10
Total	$3.68

The "Daniel Best" crude oil engine using 74 gravity gasoline:

8¾ gallons gasoline 74 gravity at 18c.	$1.57½
Labor 1 hour attending engine and filling tank	.20
Lubricating oil	.15
Electric battery loss per day	.02
Total	$1.94½

The "Daniel Best" engine using kerosene oil 110 fire test:

7⅔ gallons kerosene oil 110 fire test at 15c.	$1.12½
Labor 1 hour attending engine and filling tank	.20
Lubricating oil	.15
Electric battery loss per day	.02
Total	$1.49½

The "Daniel Best" crude oil engine using distillate:

7⅓ gallons distillate 40 gravity at 8c.	$ .60
Labor 1 hour per day attending engine.	.20
Lubricating oil	.15
Electric battery loss per day	.02
Total	$ .97

The "Daniel Best" engine using Coalinga, Fresno county, California, crude oil right from the well:

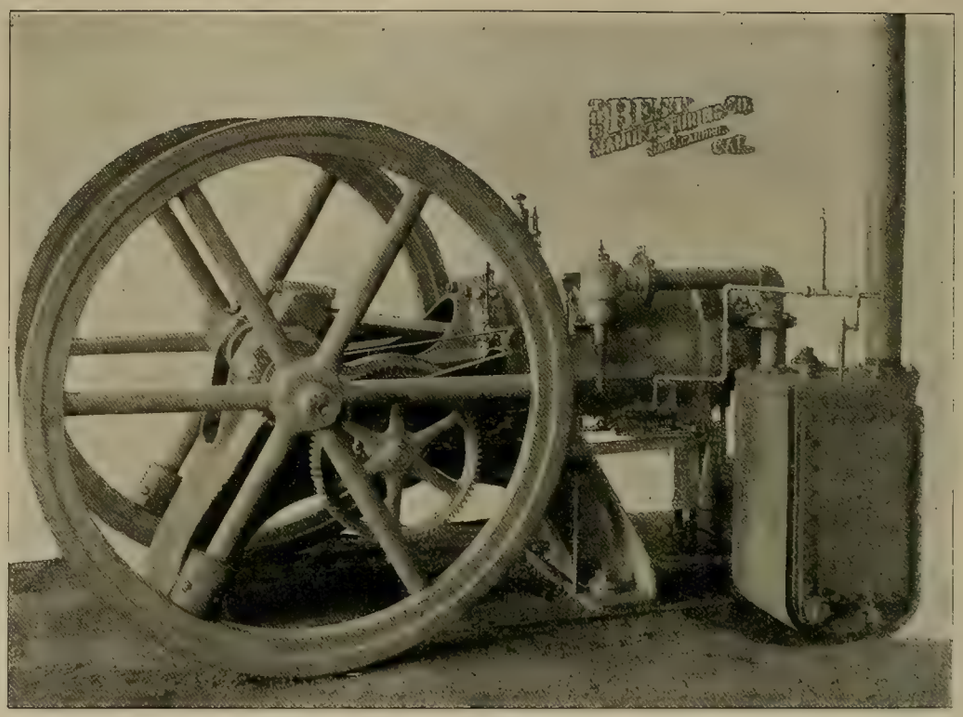
7½ gallons crude oil 36 gravity at 5c.	$ .37½
Labor 1 hour per day attending engine.	.20
Lubricating oil	.15
Electric battery loss per day	.02
Total	$ .74½

The "Daniel Best" engine using Peruvian crude oil:

13 gallons crude oil (Peruvian) at 5c.	$ .65
Labor 1 hour per day attending engine.	.20
Lubricating oil	.15
Electric battery loss per day	.02
Total	$1.02

The generator also acts as a refinery, and from the 13 gallons of the Peruvian crude oil used we have left a residue of 3 gallons of good lubricating oil, so from this total subtract the value of this residue or machine oil:

Total cost as above	$1.02
Less 3 gallons machine oil or residue at 15c.	.45
Total cost of running ten hours on Peruvian crude oil	$ .57



The following summary will then show cost of running a 5-horse power engine ten hours:

Steam power	$3.68
"Daniel Best" engine on gasoline	1.94½
"Daniel Best" engine on kerosene (common coal oil)	1.49½
"Daniel Best" engine on distillate 40 gravity	.97
"Daniel Best" engine on crude oil (Coalinga)	.74½
"Daniel Best" engine on crude oil (Peruvian)	.57

From these results it is easily seen what it is possible to do with our improved gas generator. By its use we get even much better results when using gasoline of 74 and 86 gravity, such as used in the ordinary gasoline engine, and much better results from lower grades of gasoline, as well as common domestic coal oil, distillate or crude oil, than is possible to get from city gas, as all gas engines run with city gas if they will run at all.

With this generator we vaporize the gasoline drop by drop, and when taken from a 50 to 100-gallon tank the last drop is as rich in gas as the first.

Every one knows of the economy of using the exhaust heat to heat the water of a steam engine boiler before it is pumped into the boiler, i. e., changing of a liquid (gasoline) to a gas produces freezing cold gas, which, when drawn into the cylinder, consumes part of its own force in heating the balance to a point of chemical change. We save the heat (which is power) of the exhaust to vaporize these lower grades of oil; there is more gas in a gallon of low-grade gasoline, distillate or crude petroleum than there is in a gallon of high-grade gasoline 86 gravity, and it is only a question of a practicable way of utilizing the waste heat to make gas of these cheap grades of oil. We have solved this problem by the use of our improved generator, and other advantages are that the danger of fire is very materially reduced; in fact, to the same bases as when using city gas, for when using gasoline, kerosene or distillate we connect with a 50 to 100-gallon tank, as the case may be, 30 to 100 feet from the engine, and it is pumped into the generator with an automatic pump only as required to produce gas enough for the engine. There is no danger of explosions of crude oil; the tank containing same can be placed where most convenient, and the oil pumped automatically to the generator when required in the same way. THE BEST M'F'G CO. *

THE "DANIEL BEST" CRUDE OIL ENGINE.

Do You Know THAT THE . . . .

MINING AND SCIENTIFIC PRESS.

HAS THE LARGEST CIRCULATION OF ANY PAPER OF THE KIND IN THE COUNTRY? : : :

. . THAT IT IS THE ONLY PAPER OF ITS CLASS . .

THAT GIVES THE EXACT FIGURES OF ITS CIRCULATION?

It Is Weekly Read by More Than 20,000 Men in Every Department of Mining and Mechanical Industry.

IF you want your business advertisement seen by the *MEN TO WHOM YOU NATURALLY LOOK FOR BUSINESS* put it in the

MINING AND SCIENTIFIC PRESS.

ESTABLISHED MAY, 1860.

A paper that has led in its line for nearly thirty-seven years must have the qualifications that entitle it to the patronage of intelligent men who realize that, while advertising pays, money is thrown away that is given for advertising in papers with no circulation and which give no results.

It is not what advertising costs, but what it produces, that determines its value.

The MINING AND SCIENTIFIC PRESS produces satisfactory results to those who use it. : : : : : : : : : : :

Economy is the judicious expenditure of money. It is sometimes economy to save ten cents; it is sometimes economy to spend a thousand dollars. Economy in advertising means to put your advertisement where it will do you good.

Our patrons find an investment in our columns a profitable one.

J. F. Halloran

Wanted: Good Engine Lathe.

14 to 16-Inch Swing. State condition, maker's name, and price. Address "LATHE," Mining and Scientific Press, San Francisco.

To Drill for Coal.

Estimates wanted for boring for coal. Only competent and expert man wanted. Call at Room 205, Crocker Building, for particulars.

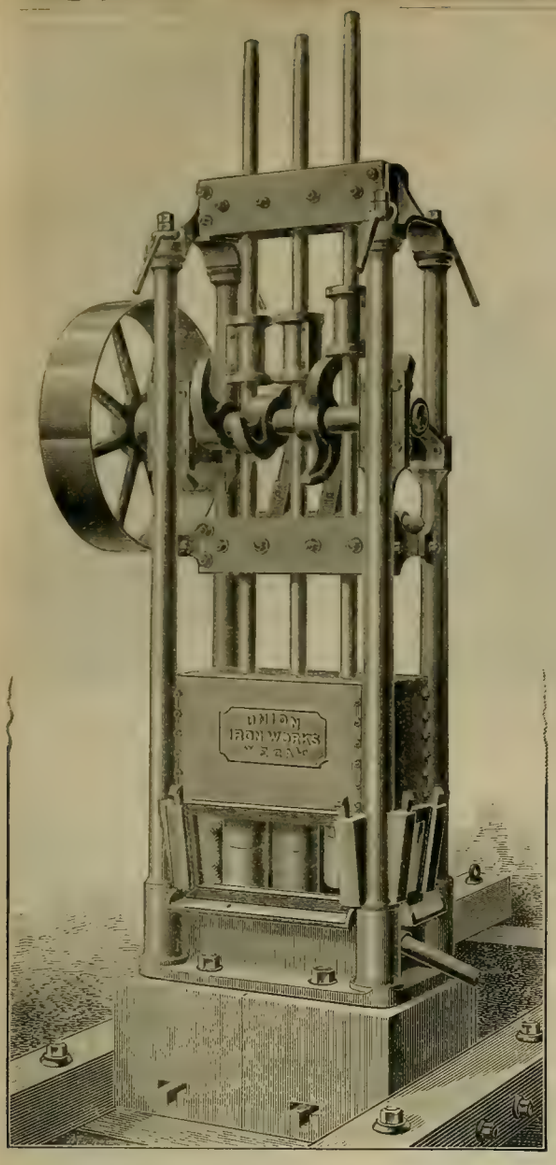
British Columbia.

W. J. R. COWELL, B.A., F.G.S., Mining Engineer,

Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,



Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park

TUBBS CORDAGE CO.

(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice

Coast Industrial Notes.

—Santa Cruz, Cal., is raising $10,000 to establish a woolen factory.

—The California Woolen Mills, Petaluma, Cal., have resumed operations.

—This year's orange crop at Redlands will bring California $400,000. The fruit sells for $2.50 per box.

—The Navy Department has ordered the first payment of $80,000 to the Union Iron Works upon the battleship Wisconsin.

—Railroad engineers have incorporated the Tia Juana Fruit Company, to do business at the Needles, Cal., with a capital of $60,000.

—The California State Mining Bureau proposes to make a thorough geological survey of the region lying within a radius of ten or fifteen miles of the town of San Luis Obispo.

—A news bulletin can now be flashed from New York to San Francisco in ten seconds, heavy copper wire which spans the continent without relay stations making this rapid transmission possible.

—The Manufacturers and Producers' Association will hold a stockholders' meeting, Room 2, 6th floor, Mills Bldg., S. F., at 1:30 P. M., next Wednesday, the 24th inst., to elect officers for the ensuing year.

—The O. R. & N. people contemplate the construction of a line from Umatilla Junction or Wallula, up through the Okanogan country and into the mining districts of the Kootenay country.

—Two or more trains run regularly over the U. V. & P., Arizona, on account of the machinery and building material daily arriving at the junction. Bullion at the Jerome smelter is increasing, and shipments are now made almost entirely at night.

—Sixteen hundred carloads of beans are stored in warehouses in Santa Barbara and Ventura counties. About half are Limas and the rest other varieties. When the beans are stored in Southern Pacific warehouses the company advances $1 per cental.

—A dividend (No. 23) of 25 cents per share has been declared on the capital stock of the Paraffine Paint Co., 116 Battery street, San Francisco, payable at the office of R. S. Shainwald, secretary, on March 29. This company furnishes a good article and is deservedly prosperous.

—The Santa Fe Railway Company is changing its oil-burning engines in California back to coal burners. The company has been using from 600 to 800 barrels of oil per day, but the rise in price, with the still further advance, as a result of the oil combiniation, has resulted in going back to the former conditions.

—The mill of the Corralitos Paper Mill Company, recently built at Watsonville, Cal., has been shut down. The people residing along the stream on which the mill is located complained of refuse from the mill running into the water, and, as there was no other place for it, the only alternative was to close the mill.

—Three hundred tons of steel rails have been sent to Salinas, Cal., to be used in building a mile of railroad switches for the new beet sugar factory. There will be over 500 acres of land occupied by the factory and its necessary beet sheds, pulp sheds, pumping plants, reservoir, machine shops, offices, warehouses, switches, etc.

—It is estimated at the Chino, Cal., sugar factory that 144,000 tons of beets will be delivered there next summer and fall. From these will be made 40,000,000 pounds of sugar. The output in '96, with a short crop of 65,000 tons of beets, was 17,000,000 pounds of sugar, which, at a net profit of 1¼ cents a pound, netted the factory owners $250,000 for the season.

—About 20,000 acres of land west of San Bernardino, Cal., have been bought by the Anglo-American Canaigre Company and the Chicola Water Campany. It is stated with apparent authority, that when the investment is completed, it will represent an outlay of $1,500,000. The company will put in a crop of canaigre, 2000 acres to be planted this year. A canaigre factory will be built a year later.

—San Francisco has in operation one of the most thorough systems of food inspection in the country. It consists of four inspection stations, covering the whole of the city. It is the intention of the Board of Health to wage war on everything found adulterated. The chemical laboratory planned by the board is completed, and the various deputy inspectors are collecting samples of different kinds of food throughout the city. All adulterated brands will be condemned and confiscated.

—By a new contract between Sebastian Camacho, acting in behalf of the Western Railway Company of Mexico, and the Department of Communications, represented by General Francisco Z. Mena, the company in question agrees to keep in commission two steamships of 400 tons each, to make regular trips between the ports of Guaymas and San Benito on the Pacific, touching both ways at La Paz, Altata, Mazatlan, San Blas, Manzanillo, Acapulco, Puerto Angel, Salina Cruz and Tonala.

—The general officers of the Oregon Short Line are as follows: W. H. Bancroft, vice-president and general manager; S. W. Eccles, general freight and traffic manager; E. E. Calvin, general superintendent; D. E. Burley, general passenger and ticket agent; J. C. O'Melveny, engineer mountain division Union Pacific, chief engineer; J. F. Dunn, master mechanic Union Pacific at Pocatello, Idaho, superintendent of motive power; Ira O. Rhodes, assistant to purchasing agent Union Pacific, general purchasing agent; E. J. Fisher, claim agent mountain division Union Pacific, general claim agent; W. D. Lincoln, car accountant; J. B. Evans, general tax agent; J. M. Bennett, assistant superintendent bridges and buildings Union Pacific at Pocatello, superintendent of bridges and buildings; H. C. Smartwood, general baggage agent. The offices have been opened in Salt Lake City.

Personal.

CORBETT should now be appointed American consul to Nevada.

E. K. STEVENOT has returned to San Francisco from Sonoma county.

JULIAN SONNTAG has resigned the secretaryship of the Cal. State Miners' Association.

D. A. BENDER has been appointed assistant general manager Alameda & San Joaquin Railroad.

THOMAS ORMAN has been appointed superintendent of the De Lamar mine and mill at Pioche, Nevada.

T. M. O'BRIEN, who has been in the Yukon country since 1887, has arrived in San Francisco and will return to Circle City, where he has large interests, in June.

M. A. KNAPP has gone as engineer to the Rosario mines, 60 miles back of Mazatlan, old properties which have long been worked and which now employ about 900 men.

RALPH NICHOLS last week resigned the superintendency of the De Lamar mines at Pioche, Nevada, and left for Leadville to take charge of the Moffit and Smith properties.

COMMISSIONER OF THE GEN. LAND OFFICE, LAMOUREUX, who used his high official position to beat the mineral land bill, and who did his best or worst against that needed public measure, has been caught in other equally questionable work and will be dismissed from the department.

Commercial Paragraphs.

WITHIN two years past between 3000 and 4000 Anaconda axles have been put in use in Montana and other western States and British Columbia. Users find them cheap, simple and easy to care for, and "repeat" orders are numerous. A catalogue describing this axle is published by Fraser & Chalmers, Chicago.

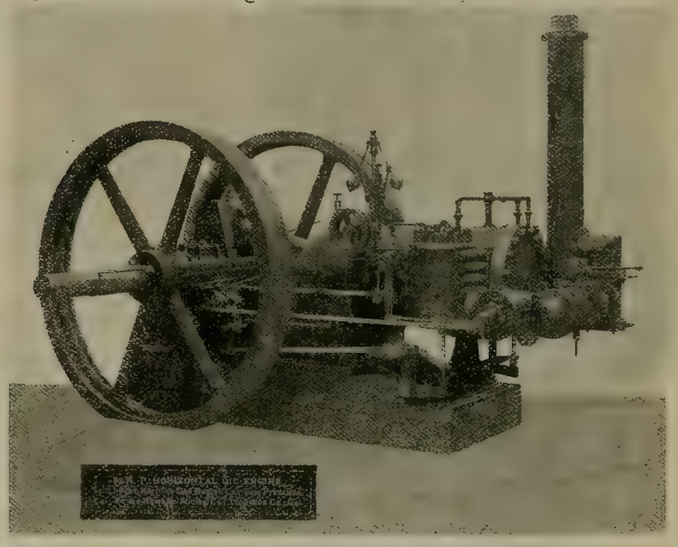
THE large Rand compressor, recently installed in the LeRoi, B. C., mine, will be known as the "Senator," and is to be used for running all the pumps and hoists at the mine, in addition to operating forty drills. It is described as a beautiful piece of mechanism in every detail of its construction, and is fitted with the latest type of mechanical air valves, automatic governors, etc. It has the distinction, furthermore, of being one of the three largest compressors in use in the Northwest. The machine is a Rand air compressor of the latest improved type, with Corliss compound condensing engine; size of steam cylinders, 22x40x48 inches stroke; air cylinders, 22x34x48 inches stroke, with intercooler. The Rand Drill Company, 100 Broadway, New York, builders, report a steadily increasing demand for their compressors and drills for mining purposes, and claim that they make the most efficient, economical and durable machines for this class of work on the market.

THE success of the operation of long-distance electrical transmission is perhaps best gauged by the opinion expressed by the company operating the plant. An extract from a recent letter regarding the operation of the Fresno, Cal., long-distance transmission may be interesting to our readers. It was written by Mr. John J. Seymour, president of the San Joaquin Electric Company, operating the San Joaquin river and Fresno transmission, to the General Electric Company, which installed it: "It affords me great pleasure to write you regarding the successful operation of the long-distance transmission plant installed for our company. The entire plant as furnished has been in actual practical operation for a period of several months. The thirty-five miles transmission has given us no trouble whatever. Our load at present consists of 145 arc lights and 5000 incandescent lights and 410 H. P. in motors, the latter including 180 H. P. for the Sperry flour mill and 75 H. P. for the city pumping plant. All of the machinery doing this work has worked with perfect success from the start. The incandescent lights have most of them been newly wired in, thus enabling us to properly balance the load, and the regulation has given us no trouble whatever. During extensive tests it was impossible to find more than two volts variation between any lamps on the system. Lights so furnished seem to me to be better than incandescent lights usually furnished in San Francisco and other cities of the State."

Recent California Mining Incorporations.

Reliance G. M. Co., San Francisco; capital stock, $500,000—all subscribed; W. T. Harley, J. H. Sayre, W. J. Gwynn, L. Bowles, I. T. Milliken, W. Sharwood, W. F. Drake.

St. Elmo Mining and Water Co., Los Angeles; capital stock $2,500,000—$759,500 subscribed. W. Ferguson, J. F. and M. M. Turner, E. H. Gould, C. T. Thomas, M. J. Blaisdell, C. L. North, Los Angeles; D. M. Pyle, Bakersfield.



Cripple Creek—Its History to Date, Illustrated.

Just out, with correct map and costly full page views natural as life. This great book will be sent free prepaid with our big 56-col. family paper 3 months on trial for 25c (stamps or silver); club of 5, $1. Latest mining news. Mention The Press and address *Illustrated Weekly Sentinel*, Denver, Colo.

E. E. BURLINGAME'S ASSAY OFFICE AND Chemical Laboratory. Established in Colorado, 1866. Samples by mail or express will receive prompt and careful attention. Gold and silver bullion refined, melted and assayed or purchased. Address 1736 and 1738 Lawrence Street, Denver, Colo.

Hercules Gas Engine.

Herewith is illustrated an 80 H. P. Hercules self-starting gasoline engine shipped to the Rawhide mine near Jamestown, Tuolumne county, Cal., where it will be used to drive the company's new 10-inch Cornish pump. The engine is of the horizontal, single cylinder type, very heavy and substantial, of simple design and built to withstand severe and continual service. The generator will vaporize either gasoline or low-grade distillate oil, the latter being an exceedingly efficient fuel and very cheap. The governor, instead of being the usual fly wheel or shaft type, is a fly ball or pendulum governor, and controls the speed of the engine very closely by operating a valve in inlet pipe. The electric igniting device is very substantial and easily cared for. The electrodes are heavy pieces of hard steel, located in combustion chamber, the electrode stems passing through inlet valve head to permit tension springs being external and away from heat. This obviates the necessity of removing head to renew or adjust electrode springs. The tension springs can be adjusted while engine is running. A self-starting device does away with either a small starting engine or the labor of turning engine over by hand. The point of ignition is adjustable, permitting the highest possible efficiency at minimum consumption of fuel. Every precaution was taken by the builders, the Hercules Gas Engine Works, to guard against mishaps, and under exceedingly sure tests the engine made a splendid showing of economy, efficiency and general excellence.

80 H. P. SELF-STARTING GASOLINE ENGINE, WEIGHT 16,500 LBS., BUILT BY THE HERCULES GAS ENGINE WORKS, SAN FRANCISCO.

Recently Declared Mining Dividends.

South Swansea, Utah, $7500, payable March 20.

Centennial-Eureka, Utah, $30,000, payable March 15. The total to date is $1,920,000.

ARE SOLE AGENTS FOR THE

Wilfley Concentrating Table,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Anyone can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.

ROMLEY, COLO., Jan. 19, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Answering yours of the 5th inst., would state that after a thorough trial we have discarded seven Woodbury Tables and two Johnsons and adopted the Wilfley Concentrating Table, which we think up to date is the best table in the market, so far as our knowledge is concerned. Yours very truly, [SIGNED] B. B. MORLEY, M'g'r Golf M. & M. Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

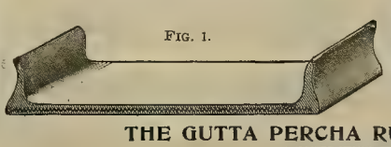

FIG. 1.

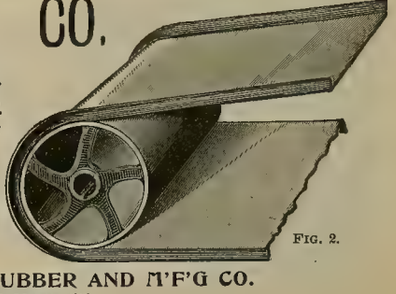

FIG. 2.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A STEAM ORE STAMP.

One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL**, installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed. We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C. McDONALD, Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

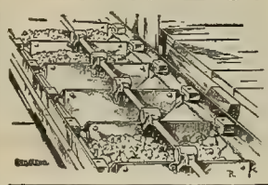
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.



KENDALL GOLD AND SILVER EXTRACTION CO.

THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $36.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DRAFT CONNECTION FOR VEHICLES.—James Porteous, Fresno, Cal. No. 578,581. Dated March 9, 1897. This invention relates to the class of connections by which the draft devices such as poles and shafts are attached to vehicles. It is especially adapted for use upon vehicles having a single pivotal front wheel, such, for example, as the three-wheeled trucks used in vineyards and orchards, and its object is to provide a simple and effective device for readily interchanging the pole or shafts in connection with such trucks and at the same time furnishing a bearing on each side with which to steady the connection and guide the truck. It consists essentially of a pivotal pin for the wheel bearing having its lower extremity formed into a hook, a coupling bar or draft device having its rear extremity formed with wide parallel spaced jaw plates adapted to recive the hook between them, and to furnish a bearing for the hook and a cross pin passing through the jaw plates and engaging the hook.

SUN SHADE.—Frank E. Lashells, Sacramento, Cal. No 578,572. Dated March 9, 1897. The object of this invention is to provide a sunshade adapted to be readily and firmly secured to a person, to fit persons of different sizes and capable of having its inclination and position varied to suit conditions under which the sun may be shining on the individual. It is especially applicable to persons walking, horseback riding, in vehicles, or for bicycle riding. It consists of a vertically adjustable supporting standard having the sunshade adjustably fixed upon the upper portion, a means for carrying the standard, consisting of a waist belt to be fitted to the user and upwardly diverging back frame secured to the waist belt and to which the standard is secured, and devices passing over the shoulders and connecting the top of the back frame with the waist belt in front.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. VULCAN ROPEWAY

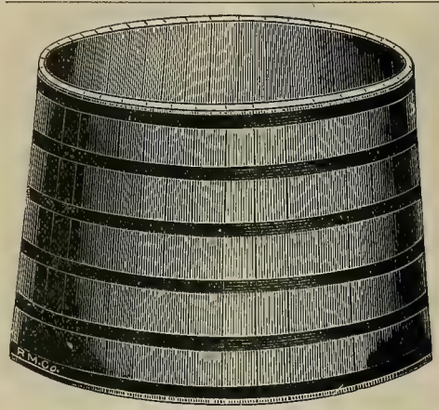
—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.



EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

HENDY-NORBOM CONCENTRATOR.

Office of WEBB GOLD MINING COMPANY.
G. McM ROSS, SUPERINTENDENT.
BROWN'S VALLEY, CAL., Sept. 14, 1896.

Mr. John O. Norbom— DEAR SIR: I have been using your Concentrators at our mines in Brown's Valley and am pleased to inform you that they are in every respect thoroughly satisfactory. When erecting the plant at the above-named place we built Canvas plant, but since putting in your Concentrators we have but little use for that. The percentage of sulphurets now being handled is from 1½ to 2 per cent, mostly galena and iron pyrites, and crushed fine. We save from the pulp over your machine 98⅝ per cent, and it hardly pays for the labor on the Canvas plant. The motion given your Vanner by its delicately constructed curved springs renders it a perfect machine and in my estimation it is but a short time before it will replace all other machines of a like nature now in use.

Yours very respectfully,
[Signed] F. W. PAGE,
General Manager Webb G. M. Co.

SAN FRANCISCO, CAL., Jan. 31, 1897.

Joshua Hendy Machine Works: GENTLEMEN: I have used two of your Hendy-Norbom Concentrators for two seasons in Alaska, and wish to say that in their operation they have given almost perfect satisfaction. They have handled ten tons each per day of ore carrying from 3 to 6 per cent of sulphurets, an average saving of 95 per cent.

With ores carrying 3 to 4 per cent sulphurets, they will easily handle ten tons each per day and save over 95 per cent; but with a more heavily sulphuretted ore the quantity given them to work should be less.

With the improvements you have made in this machine since ours were bought, I should say that your Concentrator was almost perfect in capacity and in saving and wearing qualities.

Yours truly,
[Signed] N. S. TROWBRIDGE,
Supt. Bald Eagle M. Co.

Market Reports.

The Markets.

SAN FRANCISCO, March 18, 1897.

The fickle character of the weather continues to interfere with an active trade call. Buying, unless for easily accessible points, is still in small quantities, owing to generally poor roads. Nearly everything that will be affected by the Dingley tariff is being marked up, with still higher values looked for when positive information comes to hand regarding how the different schedules will pass. On this coast many farm industries will be well protected, as will coal and nearly all kinds of metals. While the latter is good for the miners benefited, it works an injury on iron workers in particular, for it is calculated to give the East still greater advantage, for our iron, etc., is largely foreign, owing to the small output here, while the East has an oversupply and is increasing in export. Eastern advices continue to note growing firmness and a general feeling that the time for the better has come and business will steadily improve. The different financial trade and mining journals are largely optimists on the situation.

The local money-market is practically unchanged. Money begins to come out for investment, which will grow as the spring months pass and business improves. Exchange on New York is slightly firmer. Light shipments of produce eastward offer limited exchange. Importers of foreign goods are said to be sending money East to withdraw them from bond in anticipation of an early passing of the tariff bill. The East reports the rates of interest firming up. The stronger tone is due to more inquiry for funds and decreasing bank reserve. There have been free withdrawals of goods from bond, which necessitated payments of duty. These payments, it is said, aggregate a large sum at the end of each week.

New York Silver Prices.

NEW YORK, March 18.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 3-16	63⅝
Saturday	29 1-16	63⅜
Monday	28 15-16	63
Tuesday	28⅝	62
Wednesday	29 9-16	62⅛
Thursday	29 9-16	62¼

	Copper.	Lead.	Iron.	Tin.
Friday	11 85@12 00	3 40	10 25@12 50	13 40
Saturday	11 85@12 00	3 40	10 25@12 50	13 40
Monday	11 85@12 00	3 37½	10 25@12 50	13 35
Tuesday	11 85@12 00	3 37½	10 25@12 50	13 30
Wednesday	11 85@12 00	3 40	10 25@12 50	13 25
Thursday	11 85@12 00	3 40	10 25@12 50	13 25

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	7½c Prem
New York Telegraphic Transfer	12½c Prem
London Bankers' 60 days	$4.86½
London Merchants	$4.85
London Sight Bankers	$4.89
Refined Silver, per oz., 1000 fine	62¼
Mexican Dollars	49½@50

SILVER.—The market continued to go up until Wednesday, when an improvement came through from New York, with still better prices to-day. This advance stopped the decline in London. The pending adverse legislation by Japan has its influence on the market. The situation at present is hard to solve satisfactorily; but there is one thing certain, unless the markets abroad receive more support than it looks as if they will receive at this writing, it is only a question of time when lower prices will rule. It may be that low market values will force leading nations to give support to the white metal. Mail advices from New York state that there is a fair outward movement.

MEXICAN DOLLARS.—In sympathy with silver, the market sold lower, but at the close there is a steadier feeling. The demand is only fair.

QUICKSILVER.—The market is firm at quotations. In our market there is more or less cleaning up by outside holders at slightly lower prices than we quote. The East and Europe report a similar condition. Large handlers look for still higher prices in the near future.

Our market is quoted at $40 for domestic consumption.

COPPER.—The East reports a continued free outward movement, with an increasing home demand. All information from abroad and from New York indicates an entire absence of any speculative movement. This would seem to point to shading in prices.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	—@13¾
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

LEAD.—In our market prices have been marked up, with a strong tone reported. The East and Europe report strong markets, with an improving demand.

Our market is quoted in jobbing lots as follows:

Pig	4 00	@	4 25
Bar	—	@	4 50
Sheet	5 62½	@	6 12½
Pipe	4 87½	@	5 37½

SHOT.—The threatened advance has taken place at last.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 35
Drop, B and larger sizes,	"	"	1 60
Buck, Balls and Chilled, do,	"	"	1 60

TIN.—The market is fairly active for both pig and tin. The tendency appears to be upward. This would be more pronounced if it was assured that the higher tariff bill will become law.

We quote as follows in a jobbing way:

Pig, per lb	14½c@ —
Plate, I C coke, heavy, per box	$4 05@ 4 15
" " " light, "	3 95@ —

BORAX.—Market prices and demand are practically unchanged.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5¼
Powdered, in car lots	5
Concentrated, "	4½

POWDER.—The market is higher. The demand continues free.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—There is continuation of both American and foreign. The market shows considerable firmness. The East reports a large consumption, with values fairly firm. The exports of southern to Europe promise to be very heavy this year.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL—The market is practically unchanged. There is a continued fair consumption of household, but steam seems to be falling off some. The supply of all kinds is ample.

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is firm at an advance.

Our market is quoted at 7¼@8¼c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6¾@7c for Hallett's and 6⅞@7c for Japanese.

NAILS—The demand is increasing.

Wire, carloads, basis per keg	
" jobbing, " "	$2 25
Cut, carloads, " "	
" jobbing, " "	2 10

SPELTER—The market is quiet but firm. The East reports a fairly active demand.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The markets here and at the East are steady.

PLATINUM.—Dealers report a fair inquiry. Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is steady at quotations. Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—There is a fair inquiry for the season.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is steady to firm.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

Pending tariff legislation unsettles the market somewhat. The general feeling is that prices will advance on several lines.

BONEASH.—There is a good export movement, chiefly to Australasia.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is reported quiet but firm at 2¾c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but steady at $1.70 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a slow demand at 2¼c a pound from stores.

NITRATE OF SODA.—Advices from primary markets are against sellers. Our market is easy.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is quiet at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is light. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—The Eastern markets are steadier. Our market is steady, but dull.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, March 18, 1897.

The market continued dull throughout the past week, with no redeeming features worthy of note. Fluctuations were downward up to Wednesday, when Chollar showed more strength, steadying the entire line. Con. Virginia sold at $1.20 the past week, which is a lower figure touched than for a long time past. Low as it is, the belief in well-informed circles prevails that considerably lower prices will be seen within the next few weeks, although a rally may take place first. This opinion is doubtless based on seemingly authentic advices, that large money men are not in the market, and not likely to come in until all lawsuits have been ended and enough ore uncovered to justify them in taking a hand in promoting a bull movement. If this is the correct situation, then outside holders will have to face more assessments and lower prices. They begin now to talk about the prospects of striking the west lode by the long west crossdrift, which is being run jointly by Con. Imperial, Challenge and Confidence. This crossdrift, it is stated, ought to strike the west lode in April. We venture the opinion that even if it does, it is safe to predict that no big reports will be made of the find. The writer has reason to believe that the work will not go beyond the first few feet of ore, which does not assay more than fair grade. It is quite possible that they may do the same as has been done in Alpha, fail to strike the west lode for fear, it is said, of its bearing on the share market. Even the Bullion west crossdrift was not extended far enough to the west to strike the lode. It is said to have been run in such a way as to make it very considerably longer than it should have been. The Con. Virginia stringer of ore, which it was thought by the bulls would turn out to be a good proposition, has not developed much size and only good grade. The failure to come up to expectation as work progressed has had an unfavorable effect on the shares of the mine. As these went down in value, Chollar's shares began to strengthen owing to favorable reports from the work on the Brunswick lode, and also to this mine seemingly being under improved management. The Standard Con. (Bodie district) has held steady prices. The outlook is said to be favorable for this mine.

Official letters from the Comstock mines continue stale and barren of news calculated to encourage outsiders who have been paying assessments for many a long, weary day. It is stated in well-informed circles that better reports based on actual work can be made, but they fear the public would rush in and buy, only to be heavy losers if promising prospects did not materialize. It must be cause for congratulation, this display of regard for outsiders, yet no one believes it, for dealing in shares is like playing at the game of love and war, all is fair between contestants. From the Alta group nothing of importance is at hand. The official letter contains the same "old song and dance," but as for that, all the other official letters are of the same character. The letters from Overman and Caledonia are practically unchanged. The work points to more time. The Seg. Belcher and Belcher letters fail to report on the reported strike made some time ago. Private advices state that when the powers that be are ready these mines can be made to pay dividends. Crown Point reports fair work on several levels, without any change worthy of note. No advices come to hand from Yellow Jacket. In Confidence snail progress is being made; faster work appears to be made in spending money than prosecuting work. Work is cantinued on the Challenge, Confidence and Con. Imperial joint cross-drift, but slow progress is being made. In Alpha it looks as if they are fooling away time so as to get rid of assessment money. By pushing farther west rich ore could be found—so it is reported at Virginia City. From Bullion the news is unimportant. They are prospecting in Potosi on the tunnel level. No work is being done in Chollar; all work is being confined to the Brunswick lode. The official letter from Hale & Norcross indicates that preparatory work for more exploiting has been completed. Best & Belcher and Gould & Curry are running a joint east cross-drift on the 800-foot Bonner shaft level. Active work is reported from Savage. Work in Consolidated Virginia is confined to the levels reported the past month or two; present prospects are not flatering for a big find; work must be farther west to strike the rich and wider lode. In Ophir work is continued on the 1000-foot and Central tunnel levels; nothing of importance is reported. The Mexican letter is of about the same character of those received for several months past. From Union, Sierra Nevada and Utah nothing of interest comes to hand. There are rumors about Andes, but they are not positive enough yet to note.

From the Brunswick lode the official letters

report more or less active work in Occidental, Chollar, Savage, Gould & Curry and Best & Belcher. The work in Chollar is favorable. As it progresses it shows that the mine, properly managed, can be put on a small paying basis, but it looks as if the bullion proceeds are to be eat up largely by dead work. The work reported is on the 200-foot and 500 foot levels and sinking the shaft. The latter is down on the incline over 825 feet. Stormy weather interferes with ore shipment, which stops stoping. In Occidental they are doing some active work, but the ore found, so far as reported, does not justify extracting.

The following illustrates the changes of the week:

Under date of the 12th inst. Jas. A. Pollock writes from Salt Lake City.

The mining stock market was fairly active and a decided improvement in quotations may be noted in some stocks. The tone of the market was undeniably healthy and there is a strengthening tendency in the high grade stocks that must eventually impart confidence in the general list and in time lend to a higher range of values. I regard the future in a very favorable light.

Ajax was again lower, and sold down below last week's prices. There seems to be no good reason for the depressed state of the stock, other than the fact that buying has been very limited. The properties are looking exceptionally well. Anchor and Alliance both remained without feature. The former is sending in some ore. As was stated by me would be the case, Bullion-Beck has declared its March dividend in the sum of $50,000, or 50 cents per share. The stock went off the amount of the dividend at the close, with only limited dealings. At the mines the showing of ore is reported to be very fine, but the properties are being pressed to their utmost limit, regardless of metal prices. Buckeye was a fraction stronger, with no heavy business. On the usual date the Centennial Eureka will pay the regular dividend, although shipments of ore are being very much curtailed on account of unsatisfactory treatment charges. The management announces that no mill will be erected in the immediate future.

Although the mines are looking very well, Daly was no stronger than last week, in fact, the feeling was one of depression. An immense snowslide on the 7th did considerable damage to Daly No. 1 hoisting works and caused a suspension of operations at the plant. Only limited offerings were recorded. Daly West was not very active and quotations were practically unchanged. Dalton & Lark did little business. Asking quotations were unchanged with bidding lower. Dalton was lower. Nothing is being done at the properties. Dexter reported a strike and the stock moved up several points, with little business really done.

Nothing was done in East Golden Gate. It has not been announced as yet what the future policy of the company will be. Another assessment is likely. Four Aces sold lower. Galena was about unchanged. The March dividend meeting has not yet been called. Geyser Marion was in fair demand, with prices about unchanged. The company is making regular cyanide shipments and official reports show it to be doing well. Horn Silver was not active, in fact, it never is on this market, there being so few local sellers. The mines are looking very well and the mill is doing good work. Little Pittsburg was active at advancing figures.

Mercur has declared its regular dividend, payable on the usual date. The stock sold up to and above the $7 mark and remained practically unchanged, even after the dividend books closed. The tendency is upwards. Some splendid developments have occurred at the mine during the past week. It is estimated that the ore reserves have been increased by fully a year's supply, through the new disclosures. The mill increase will require about forty days before completed. Mammoth recovered very materially and at the close was passing the $2 mark. Some high-grade gold ore is coming from the properties, which are looking well. Northern Light did not fluctuate widely. Higher prices are anticipated for the stock when the mill gets down to actual work.

Ontario was offering at lower figures than for some weeks, while buyers were not numerous. Richmond-Anaconda sold at last week's bidding prices. Rover was materially stronger, on encouraging reports from the properties, where the development work being carried on is uncovering some nice ore bodies. Sunbeam was fairly active at unchanged figures. Silver King has paid its March dividend, while Sacramento passed its payment for this month. The latter stock was offered down. Sunshine was not very active and prices remained unchanged. Mill operations will probably soon be resumed, as some large milling ore bodies have been blocked out. Swansea made good advances and sold at better figures than for some weeks. The company has resumed ore shipments. South Swansea has not yet declared its March dividend but will probably do so soon. The stock changed little. Tetro sold slightly lower. Utah has been making a splendid shipment record and the company is expected to pay its usual dividend this month. The treasury's condition certainly merits a payment.

Assessment Notices.

JAMISON MINING COMPANY.—Location of principal places of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 5th day of November 1896 an assessment (No 9.) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company held on the 25th day of January, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 24th day of February, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on FRIDAY, the 26th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on FRIDAY, the 21st day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W CHEYNEY, Secretary.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the date of delinquency of the above assessment is postponed to the 10th day of March, 1897, and the day of sale to MONDAY, the 29th day of March, 1897.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 43) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of March, 1897, an assessment (No. 8) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 47, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 3d day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 14th day of January, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Julius Winkler	29	250	25 00
G F. Deetken	82	1.000	100 00
Julius Winkler	96	500	50 00
Mrs. G. F. Deetken	190	600	60 00
Fred Deetken	237	1.000	100 00
Mrs. G. F. Deetken	239	400	40 00

And in accordance with law, and an order from the Board of Directors, made on the 14th day of January, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 237 Twelfth street, San Francisco, California, on THURSDAY, the 8th day of April, 1897, at the hour of 5:30 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

F. METTMANN, Secretary.

Office—237 Twelfth street, San Francisco, California.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER,

226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

These wheels are durable, highly efficient, and are the only wheels which have perfect regulation, which feature makes them especially suitable for the operation of electric machinery.

PROPOSALS FOR ROCK CRUSHER.

The Board of Supervisors of Butte County, California, hereby invites plans, specifications and proposals for furnishing the following named machinery, viz:

One Rock Crusher, with a capacity for crushing not less than 12 to 15 tons of rock, or cobble-stones 6 to 9 inches in diameter, per hour, at ordinary speed, rock to be crushed to not over 2 inches in diameter. Bids to state the price per foot for elevator attachment, and of rock screens.

One Road Roller, not less than 5 feet in width and to weigh not less than five tons.

All of the above machinery to be first class in every respect.

Bids will be received by the Clerk of the Board at his office in Oroville, Butte County, California, up to Wednesday, April 7, 1897, at 10 A. M. The right to reject any and all bids is hereby reserved.

By order of the Board of Supervisors.

ED HARKNESS, County Clerk.

Oroville, Cal., March 9, 1897.

WANTED.

—A—

Hoisting and Compressor PLANT,

Complete with BOILERS, PUMPS, Etc.

Hoisting Engine Must Be Double Drum and Capable of Hoisting One Thousand Feet.

Send full particulars to

MACHINERY,

This Office.

ANGELS IRON WORKS,

DEMAREST & FULLEN, Props.

Mining Machinery.

ANGELS, CAL.

Write for estimates on complete Milling, Mining and Reduction Plants.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. NO PAY UNTIL CURED. Consultation Free. Call or send for pamphlet.

Estimates Furnished for Complete Plants for Hoisting Works, Smelters, Concentrators and Stamp Mills.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Quicksilver.

California is the only State in the Union in which quicksilver is produced, and from this State comes nearly half the world's supply. The supply can be increased easily at any time that the markets will warrant, and with the increased demand of the past two years there has been a corresponding increase in the output.

There are not in the State, however, any such great mines as the Almaden of Spain, which produced in 1895 40,669 flasks, and in 1894, 44,521 flasks, although the furnaces were closed down for six months each year. These mines could easily produce enough to supply the demand of the whole world for many years to come. In Austria, as in Spain, most of the quicksilver produced comes from one mine, the Idria. The output has for several years past been about half as much as from all the California mines. There are in Mexico three or four producing mines, several in Italy and in Russia. Altogether these three countries produce somewhat less than California.

Lately some mines have been opened in British Columbia. Inquiries have been sent to San Francisco for men and machinery for opening mines in Peru.

In California cinnabar has been profitably worked in many parts of the State. According to the last report of the State Mineralogist, from which the illustrations on this page and on page 257 are taken, there were last year nine quicksilver mines in Colusa county, thirteen in Lake, ten in Napa, two in San Benito, eight in San Luis Obispo, seven in Santa Clara, three in Siskiyou, seven in Sonoma, one in Stanislaus, two in Trinity and one in Yolo—a total of sixty-one. Of course, many of these have been but slightly exploited, while others have been practically worked out and others have been closed down owing to the low price of quicksilver.

The quicksilver prices are practically controlled by the Rothschilds, but under such conditions that no hardship is worked on the consumers. They have control of the Almaden mines of Spain and of the Idria of Austria, and from those mines could easily produce more than the world requires. Of late the price of quicksilver has gone up from $36 to $40, but if any attempt were made to largely increase the price above the last figure, many other mines now idle would be opened.

Until a few years ago large quantities of quicksilver were shipped to China and Japan from California, but that market has been entirely closed to American producers by the Rothschilds.

The output of the California mines in 1893 was 30,164 flasks, in 1894, 30,440 flasks, and 1895, 35,122 flasks. According to the most reliable estimates, the output of 1896 fell off to about 30,000 flasks.

While there is apt to be an increased demand in this country for a number of years to come, it is not likely that this will largely increase the price.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Manhattan Quicksilver Mine; Furnace of the Mirabel Quicksilver Mine; Great Western Quicksilver Mine; Redington Quicksilver Mine, 253. Great Eastern Quicksilver Mine; Ore Drier of Great Eastern Mine, 257. Franklin M. & M. Co.'s Flume, La Belle, N. M.; Mexican Adobe and Oven; El Moro Coke Ovens, Trinidad, Colo., 259.

EDITORIAL.—Quicksilver, 253. The Work of the California Mining Bureau; The Mineral Lands Bill; Gravel Mining Failures; Hydraulic Miners and the Association; Mr. Crawford's Work; Value of Stock Gambling to Deep Mining, 254.

SCIENTIFIC PROGRESS.—The Origin of Petroleum; Utilizing Wave Power; Temperature of Arid Regions; Artificial Light; The X-Ray Again, 260.

ELECTRICAL PROGRESS.—Electricity in Safe Breaking; Electric Tramways in Paris; Atmosphere Surrounding an Electric Arc Light; American Electrical Goods; Apparatus for Electric Heating and Cooking; A New System of Electric Light, 260.

MECHANICAL PROGRESS.—A New Method of Dressing Car Wheels, Axles, etc.; The Country's Industrial Progress; A Delicate Instrument; A Little Heat Engine; Oil-Fed Twist Drills; The "Self-Regulating Wave Motor," 261.

PRACTICAL INFORMATION.—Hard to Figure Out a Rule; Bacteria; What Is a Gallon? 261.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 262-3.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 274-5.

MISCELLANEOUS.—Concentrates, 255. Notes on the Cyanide Process; Why He Can't Sell, 256. Tendency of English Capital; Imprisoned in Mexico; The Gold Fields of the Porce River, Colombia, 257. Forest Reservations and Mining; Iron Industry in the Eastern Part of Cuba, 258. "Trinidad, the Gateway;" Railroads Needed; Ancient Coin Alloys; Uses a Band Saw, 259. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; Book Notices, 265. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 270. Estimates on Government Work; High Buildings; Meeting of the American Society for the Advancement of Science, 275.

The Mineral Lands Bill.

The Mineral Land bill has again been introduced in Congress. Although the present special session will be short, and few bills not connected with the cause for the call are apt to pass, it is probable that there will be little of the old opposition to this meritorious measure, except from the railroad people, and they have lost most of the means of blocking its way that they had at the last and preceding session. But for the work of Mr. Lamoureux, the General Land Commissioner under the last administration, the bill would have been passed without difficulty. He has gone out of office under a cloud and has been succeeded by ex-Congressman Binger Herman of Oregon, who on the floor of the House was one of the ablest champions of the measure. Senator Mitchell of Oregon blocked the bill at one stage, but has been relegated to private life. The California delegation may be relied upon to do all in their power, and altogether the way seems smoothed for the bill.

Gravel Mining Failures.

Probably in no branch of mining has a larger proportion of failures been made than in working gravel. This is largely due to the fact that most of those who go into this branch of mining imagine that the problems are all simple. During the palmy days of hydraulic mining in California it is safe to say that over 50 per cent of the large undertakings did not pay. Yet of the men who were engaged in mining then those who are now working gravel make few failures. They have learned hard lessons. With no authorities to fall back on, and no past experience with large hydraulic pipes, big ditches and flumes and under currents, they were compelled to work out their own problems. They built up a system of hydraulic mining that is the standard the world over. So it is with drift mining.

Yet of those who have been opening up gravel mines in other States and Territories, few take advantage of what has been learned here and employ California miners; but, assuming that their enterprises are simple, employ surveyors or civil engineers without experience in the kind of work to be done. As a result, failures are being continually recorded.

In working dredgers there has been considerable success for many years in New Zealand while in British Columbia, Idaho, Montana and elsewhere many dredgers have been built which have proved to be failures. Upon the Fraser river in British Columbia, a great deal of money has been lost in this way. At Marsh, Idaho, a big mining dredge boat which cost $35,000 and which never realized a dollar in profits is being dismantled. It is probable that had information been obtained from New Zealand where this class of work is understood better work would have been done.

Mr. Crawford's Work.

Next Thursday Mr. J. J. Crawford, the State Mineralogist, will turn over his office to his successor. The mining industry of California owes to Mr. Crawford considerable for the work he has done that has been of real value. Too often public bureaus such as this are given to wasting opportunities by issuing data of more value to the future historian than the worker of the present. Then, it is often the case that work done is of too scientific a nature, or, in other cases, there is not enough of the economic scientific work that is of most value, for the reason that the data so gathered is not otherwise obtainable. In no country in the world is so much done by the Government for the people in the way of publishing information for the good of different industries as in the United States. Heretofore too large a proportion of the work done by the Federa government, or by the different State governments, has been done by men who could not appreciate the fact that the purpose of the work intended to be done was much more economic than scientific. This has been the trouble with the United States Geological Survey until the present director took charge.

In the State bureaus, and especially those which have to do with geology and mining, while the intent of the laws establishing them have been good, the value of the work has often been questionable, simply because politics has had too much to do with the choice of men and the reports have been padded with worthless material. It is all very well to talk of doing "practical" work, but, after all, the practical work that will be worthy of confidence must be done by men of education as well as practical experience. In mining, more than in any other industry, science plays a large part. The best miners the world over to-day must know something of geology, mineralogy, chemistry, civil engineering, mechanical and electrical engineering.

Copies of the bulletins published by Mr. Crawford have been called for by miners, not only all over California, but in all the mining districts of the world. Their preparation has required the assistance of men of education as well as experience. These are: "Methods of Mine Timbering," "Gas and Petroleum Yielding Formations of the Central Valley of California," "Catalogue of California Fossils," "The Cyanide Process," "Notes on Gold Milling Practices in California," "Mineral Statistics of California for 1894 and 1895," "Mine Drainage, Pumps, etc.," "A Bibliography Relating to the Geologic Paleontology and Mineral Resources of California," and, about to be issued, "Oil Yielding Formations of Los Angeles, Santa Barbara and Ventura Counties." Besides these in the twelfth and thirteenth reports are many other articles on special subjects connected with mining, written by authorities, a full list of which would show that a great deal of high-class work has been done.

Hydraulic Miners and the Association.

The California Miners' Association, it is announced, is out of funds, and the various county organizations have been requested to send in their pro rata amounts as soon as possible. In this connection, President Neff suggests that those who are now working hydraulic mines under permits from the United States Debris Commission—some 230 in number—be asked to come forward at this time with a special subscription, to show their appreciation of the good that has been done for them by the Association. But for the California Miners' Association none of these 230 mines would be running to-day.

More than that, mainly through the efforts of the California Miners' Association, large appropriations have been made by the State and Federal governments to build restraining dams, the State has appropriated a large sum for dredging the Sacramento river and good feeling has been brought about between the miners and the farmers. It would appear that the outlook for much further increase in hydraulic mining and under easier conditions is very bright. Certainly, some recognition of this work of the Association should be made by the hydraulic miners as a body.

Value of Stock Gambling to Deep Mining.

It has always seemed strange to the mining world that in California, in proportion to the amount of work done, there has been less deep mining than in other and smaller districts. What makes this particularly remarkable is the fact that to California the mining world turns more than anywhere else for its best mining engineers. Probably the chief reason why there has been so little deep mining on the so-called mother lode of California is the fact that there has never been offered by the public, through stock speculation, large sums to be expended in bold ventures, as there has been in other districts in the world. Nearly all the work that has been done in quartz mining in California has been undertaken by private individuals, or by a few men united in close corporations, who could not afford the risks of bold undertakings. In nearly every California mine the owners have sunk from level to level only upon finding ore as they go down. The discovery of ore on one level has given them confidence to sink to the next. Of the profits from the upper levels, little has ever been laid by for working capital to enable them to undertake extensive explorations.

It was much the same in Rhodesia in South Africa, where those who first went in, stripped the surface and paid out their profits in dividends, but put nothing aside for working capital. As a consequence they did not go very deep and the question as to whether the mines would pay in depth was not solved. In New South Wales it was the same—the mine owners working from level to level as ore was discovered, but never putting money aside for large developments.

But on the Comstock there was as bold mining as was ever done in the world, and all in spite of greater difficulties and heavy expenses for water, wood and machinery. The reason for this was that the speculative public was back of the enterprises, and there was no end of money to be obtained. The public was indifferent to the cost, most of the individuals buying in to-day and selling out to-morrow, caring little as so what the future of the mines would be. But the California mines were never on the stock market and consequently never backed by the general public, as were those of the Comstock.

The Rand mines of South Africa are a good illustration of how much more the public, who know little about mining, can do in the way of bold mining, than can the real miners with their small capital. It is true that a large proportion of the speculative public lost money in the Comstock and on the Rand; so, too, will probably the London public lose money in Western Australia; but altogether the world will be benefited.

It now looks as if there would be struck a happy medium in mining in California. There is now a great deal of capital ready to be invested in mines, just as there was in earlier years in California immense sums invested in wheat growing, and later in viticulture, and still later in horticulture. With a better knowledge of mining and of the mines than is possessed in any other mining district, it is probable that the industry in this State will be carried on upon much more business-like methods than it the in the past, either here or elsewhere.

In Amador and Calaveras counties during the past two years companies have either expended or made arrangements to expend between two and three million dollars in sinking deep shafts. In some of these cases it will be necessary to expend as much as a quarter of a million before determining whether there is any ore in the properties; yet the success which has been met with in those that have been sunk in the neighborhood makes it almost certain that, taken altogether, there will be an immense profit made upon the money expended.

THE work of the California Mining Bureau will not be hampered by a decrease in the appropriation, for the Legislature has included in the levy $50,000 for the two coming fiscal years. Mr. Cooper, the new State Mineralogist, will take office on the first of April. Already Mr. Watts and Mr. Fairbanks have been sent out by Mr. Crawford at the request of Mr. Cooper to examine into the oil fields of Los Angeles and San Luis Obispo counties.

Concentrates.

WATER is now only 1½ cents a gallon at Johannesburg, Cal.

A ROOP patent roaster is to be added to the Everett, Wash., smelter.

THE Nevada Queen mine at Tuscarora, Nevada, is to be started up again after years of idleness.

IN February there were seventy-seven mining locations filed with the recorder of Riverside county.

IN Brown's Valley, Yuba county, Cal., George Smethurst has discovered a quartz ledge in his grain field.

IT is reported that the Union Pacific proposes to run a branch road into the Deep Creek district in Utah.

A DEPOSIT of asbestos, which is claimed to be 300 feet wide and 2000 feet long, has been discovered at Badger, Colo.

STEAMERS from Puget Sound, Wash., bound for Alaska, are unable to carry all those who want to go north to the mines.

A CORPS of experts, under Victor Clements, are making an examination of the De Lamar property, in Lincoln Co., Nevada.

AT Johannesburg, South Africa, Puget sound fir sells for from $180 to $280 per 1000 feet, according to condition and grade.

THE new stock exchange at Rossland, B. C., will be incorporated soon and is expected to be ready for business by April 1.

PETER A. HART has purchased a one half interest in the Bella Union mine on the American river, near Auburn, Cal., for $4000.

FIFTEEN miles from Randsburg, Kern county, Cal., a discovery of coal was made last week and men have been sent out to exploit it.

THE Ploche, Nev., *Record* says that the chance of men being put to work is frustrated by the refusal of the lease of the smelter and other property there.

THE legislature of Nevada has passed an act to incorporate the town of Reno, and authorizes the issuance of bonds for water works and an electric light plant.

NO LESS than fifty-one locations of mining claims were filed with the recorder of the Randsburg district, Kern county, Cal., for the week ending March 12th.

THE Southern California Railway Company has contracted for 5000 barrels of oil from the Summerland, Santa Barbara, district, to be delivered in Los Angeles.

THE anti-debris people are endeavoring to have the Spring Valley mines at Cherokee, Butte county, closed down and the permit revoked by the Debris Commission.

IN the Summit mine, in Nevada county, Cal., last Monday, the machine drill opened up a large flow of water, that rapidly begun to fill the mine. Larger pumps have been ordered.

THE Goodwill tunnel, which is being run into Gold hill at Cripple Creek, Colo., was begun January 2nd with machine drills, and an average of 13¾ feet was made for fifty-six days in granite.

THE Puente, Los Angeles county, Cal., oil wells supply the Chino sugar factory with 80,000 barrels of oil per year. This is the residue after extracting the gasoline, refined petroleum and benzine.

AT the Butte & Boston Company's smelting plant in Montana converters will soon be put in, and when the company starts up its plant the product will be blister copper instead of matte as heretofore.

OIL PRICES at Los Angeles continue to rise and it is now selling at $1.60 per barrel, which is nearly four times as much as the price of a year ago. At $1.60 the cost is equivalent to coal at $6 a ton.

DIVIDENDS have been publicly declared by Utah mines this month to the amount of $176,500 and according to the Salt Lake *Tribune* the amounts divided by close corporations will bring the total up to $250,000.

THERE is a proposition on foot to go on with the boring of a tunnel under Sunset peak, in the Cœur d'Alene country, Idaho, for which surveys were made some two years ago. It would tap some fifteen mines.

THE second largest sale that has taken place at Rossland, B. C., is that made last week of the Columbia-Kootenay group, which was turned over by the Chicago owners to F. Aug. Heinze and his associates for $500,000.

THE Santa Maria Asphalt Company, in Santa Barbara county, Cal., has agreed to sell to the Consolidated Asphalt Company of Los Angeles 300 acres of asphalt land in Santa Barbara and San Luis Obispo counties.

THE Union Hill Mining Company at Deadwood, South Dakota, have let a contract to Fraser & Chalmers for the erection of a 200-stamp mill at Galena. This, next to the Homestake, will be the largest in the Black Hills.

THE Canadian Pacific Railway Company is advertising in the British Columbia papers for bids for the grading of the Slocan branch of the Columbia & Kootenay Railway from the bridge across the Slocan river to Slocan City, a distance of about thirty-one miles.

THE value of the ore and bullion shipped from the Kootenay mines from the 1st of January to March 13th of this year was $1,814,272.31. At this rate, and there is no reason to believe it will not at least be maintained, the year's output would amount to about $9,500,000.

ACCORDING to the Butte, Montana, *Inter-Mountain*, it is reckoned that every cent decline in silver entails a loss of $50,000 a year upon the Anaconda Copper Mining Company. The company is said to have purchased a valuable copper property in British Columbia.

TELEGRAMS from Yuma, Arizona, announce that there is some excitement over the gold discoveries near Tacna station, and that a number of capitalists and representatives of capital have gone out to them. Many men and teams have left Yuma for the new mines.

JULIAN SONNTAG has, at the earnest request of President Neff, withdrawn his resignation as secretary of the California Miners' Association. A press of private business was the only reason for Mr. Sonntag's desire to give up the position in which he has done good work.

IT is understood that the Government will clear the Lardeau river from obstructions this summer, which will open up the mineral country about Howser lake, British Columbia. Then a railroad is promised by the Horne-Payne syndicate from the Columbia river to Trout Lake district.

THE official returns of the gold production of Tasmania show an output of 62,586 ounces, valued at $1,142,295, an increase of $131,160 over that of 1895. The complete official returns from the seven Australasian colonies show an output of $44,455,000, an increase of $1,061,000 over that of 1895.

THE following from a cable from the manager of the Hauraki, a Victorian gold mine, shows great profits in deep working: Total amount crushed (four weeks), 300 tons; ounces of gold, 1330. Costs, including repairing plant since fire, $10,000; profit, $10,000; 3000-foot level now being drained.

AT West Point, Calaveras county, Cal., Dr. C. E. Congdon has deeded to J. C. Cramer the Silver Mountain mine for $80,000. Mr. Cramer represents Minnesota capitalists. The property consists of a mountain of porphyry. Tests which have already been made indicate a value of from $3 to $4 a ton.

THERE is being floated in London the Gold Fields of British Columbia, Limited, capitalized at £600,000, to take over and work the Albert Canyon and Dowie Creek groups, the Channe properties, Chrome valley claims, Flossie L. mine, Little Darling and other properties in the Trail Creek and Rossland districts.

F. August Heinze announces that he will extend his railway at once from the Columbia river at Robson, B. C., to Pendleton, and thence to the coast. A bill has been introduced in the Dominion parliament at Ottawa for a charter to build a railroad from Golden to Fort Steele, in the Kootenay country.

THE net profits of the mines of Cripple Creek, Colorado, is placed at all the way from $200,000 to $300,000, on a total output of about $1,000,000 a month. Considering that a large proportion of the mines are in process of development, and but a small percentage paying dividends, this speaks well for the industry.

THE Montana Ore Producing Company has mortgaged its Silver Bow, Montana, possessions to Richard Lacy of New York for $1,000,000 worth of bonds bearing 6 per cent interest and running 20 years. The money realized is to be used by the company in acquiring other property and making improvements on what it already has.

A LEADING consulting engineer in London says that of all the vast capitalization of South African and West Australian mining companies, amounting to hundreds of millions of dollars, probably at least 50 per cent is watered stock, that less than 10 per cent of such companies will be successful and that 90 per cent will prove failures.

SPEAKING of the end of the strike at Leadville, Colo., the Denver *Republican* says that the place may look forward to a period of prosperity and that it is to be hoped that in the future more attention than heretofore will be given to the Leadville gold belt. It has been claimed that this belt is as valuable as the one at Cripple Creek.

ON the Golden Gate mine at Mercur, Utah, Captain J. R. De Lamar has blocked out ore bodies estimated to be worth several millions, and in doing this he has expended nearly $400,000 without taking out a dollar's worth of bullion. The erection of a mill and accessories for working the ore will bring the expenditure to some $600,000.

COLONEL TURNER of the Le Roi mine, at Rossland, British Columbia, in denying that the property had been sold last week to the Rio Tinto Company of Scotch capitalists, said that negotiations had been opened some time ago by that company and they had been given a verbal offer of the mine for $5,000,000, but so far had not come forward with a forfeit.

AT Bingham, Utah, a project is on foot to tunnel Markham hill for purposes of drainage and to give an outlet to the mines. It would intersect the veins of the Ruby, Native, Tough Nut, Red Wing, Julia Dean and Markham group mines, etc., reaching as far as the Montezuma, a distance of 2500 feet, and tap the latter at a depth of 1000 to 1200 feet.

A TELEGRAM from San Diego, Cal., announces that Col. E. W. Sebens, of Denver, Colo., had closed a deal by which an English syndicate purchases the Golden Cross group of gold mines at Hedges, near Ogilby, on the Colorado desert, for $1,500,000, the new company to take possession within sixty days. San Francisco parties do not confirm this statement.

THE last Congress made appropriations for the Carson Mint as follows: Superintendent, $3000; assayer and melter and refiner, $2500 each; chief clerk, $1800; bookkeeper, cashier, assistant assayer, assistant melter and refiner and weight clerk, $1500, or a total of $17,300. In addition to this, $4000 was appropriated for incidentals, wastage or loss in sweeping, etc.

THE Mammoth, Utah, *Star* is trying to get up a case to test the constitutionality of the new mining law passed by the Legislature over the Governor's veto. The two main grounds for objection are that all locations must be recorded with the county recorder instead of, or as well as, the district recorder, and that assessment work must be done within ninety days of location.

ROSSLAND, British Columbia, which is only two years old, claims a population of 8000. There is a continual stream of new comers to the place, largely of men who will not be a burden but rather an advantage to a new country, and the promises are that with the advent of English and other foreign capital a large increase will be made in the population during the year.

A TELEGRAM from Seattle, Wash., states that R. A. Lane and other Boston and San Francisco people, who had chartered the barkentine Bertha at San Francisco, had arrived there last week and employed 100 laborers to work upon a nine-mile ditch to be dug at Cooks Inlet, Alaska, in furtherance of a project to hydraulic twelve square miles of placer ground in the vicinity of Anchor Point, Turn Again Arm.

THE opening up of the Belknap reservation in Montana last week created little stir. There has been no greater rush for those who had prospects located than before the President signed the treaty, and under the provisions of that act all those who in good faith made locations on the reservation before the bill was signed are entitled to a 90 days' preference right to make good their locations after the land is officially opened up.

THOMAS TONGE, a well known writer on mining matters and an Englishman, in returning to Colorado from England, spoke of the London promoter and said: Colorado's mining industry has had an escape in consequence of the professional promoters in London having for the past year or two practically confined their attention to South Africa, Western Australia and other places. The peculiar methods of the average London promoter can only result in loss to the actual investor, or rather "speculator," and in discredit to the mining district where the properties are located. No matter what the property, the first move of the average promoter is to arrange for an excessive profit for himself, involving serious over-capitalization.

THE report of the Atlantic Mining Company of Michigan, for the year 1896 shows that the production of mineral was 6,449,660 pounds, which yielded 75.88%, or 4,894,228 pounds of refined copper, for which an average of 10.84c per pound was realized. The receipts for copper sold were $530,667; interest received, $494; total, $531,161. The working expenses at mine were $394,379; smelting, freight and other expenses, $64,830, making a total of $459,209, and leaving a profit of $71,952. To this is to be added $3185 received for stumpage on the company's property, making a total of $75,137.

THE following are the items in the proposed new tariff bill before Congress, as scheduled by the House, where debate is now going on: Lead-bearing ores, 1 cent per pound on the lead contained. Lead duties are to be estimated at port of entry, bonds given in double the amount and the duties liquidated in the end after Government assay. Lead dross and refuse lead, 2 cents per pound; sheet, pipe, shot, etc., 2½ cents; metallic minerals, crude, including monzanite sand, 20 per cent; mica, 3 cents per pound and 15 per cent; nickel, 6 cents per pound; quicksilver, 10 cents per pound.

THE railway committee of the British Columbia Degislature has reported favorably upon the applications for charters for seven different proposed railways. They are the Victoria, Vancouver & Eastern, to operate from the two first-named cities into the Kootenay country by way of Fair View, Grand Forks and Christina lake; the Nanaimo-Alberti, the Cassiar Central, the East Kootenay & Lardeau, the Stikeen & Teslin Lake and the Bedlington & Nelson. Of these, the first which has the necessary capital on hand, the Bedlington & Nelson, backed by the Great Northern, will start work at once.

THE yield of minerals in Idaho for 1895 has been calculated by the superintendent of the United States assay office at Boise. There was a falling off in the product of gold, but a much larger increase in that of silver and lead. For 1895 the gold yield was $2,594,666 and for 1896 $2,323,700. The silver yield for 1895 was $5,214,498 and 1896 $6,474,765. Of lead, the yield for 1895 was valued at $2,301,321 and for 1896 $2,953,380. The total for the three metals for 1895 was $10,110,485 and for 1896 $11,751,845. There is such a considerable increase in activity in the Cœur d'Alene country, and of placers in different parts of the State, backed by capital, that it is probable that this year's yield of gold will exceed that of 1895.

THE new tariff bill has some provisions of interest to miners and metallurgists, more particularly those relating to the proposed duty on lead and lead ore. Another matter in which manufacturers on this coast are interested is the evident intention of the framers of the present tariff bill to wipe out the rebate provision in the duty on tinplate. At present there is a rebate of 99% on all re-exported tin. In '96 there were 6,192,026 boxes tinplate used in this country, of which 2,369,540 were imported. This imported tin, when made into cans for fish, meat, oil, etc., and exported, secured a return to the American canners of the duty paid thereon. One company in '96 collected over $1,500,000 in rebates on tin thus re-exported.

THE number of inquiries daily received at this office is great. They comprise a variety of subjects. During the week just past, have been received inquiries from nine States, and three foreign countries, asking for information about books, the cyanide process, mining laws, electric furnaces for the manufacture of iron, pyritic smelting, the mother lode, geology of California, manufacture of sulphuric acid, how to construct gold saving riffles, makes of steam shovels and amalgamators, asbestos deposits, gas engines, the Peck centrifugal process, copper in Nevada, California mica, telluride, dry washers, arrastras, electric pumps, diamond drills, mining reports, river dredger, mine boring, hydraulic elevator, chrome iron.

AN agreement was entered into last year for the purchase of 400,000 shares of stock in the Elkton property at Cripple Creek, Colo., ostensibly for a French syndicate, and with the understanding that it was to be placed in France. According to the Denver *Republican*, the stock which was handled by Colorado Springs people has all been thrown on the local market and heretofore the syndicate working the deal has been able to resell the stock at a handsome profit, the constant improvement in the property making an expansive market that would absorb the large blocks when the syndicate found it advisable to sell. After taking 300,000 shares in this manner and rehandling them at a profit of from 20 to 50 cents a share to the syndicate, the market has apparently been filled up, and now the syndicate with its last 100,000 shares on hand finds the price dropping.

ON the 23rd inst. Senator Perkins introduced in the Senate the California mineral lands bill, practically the same as that in the last Congress, which failed after passing both houses, but with amendments in the Senate. The present measure provides an appropriation of $40,000 to carry out the provisions of the act. It is set forth that there shall be a board of three commissioners appointed in each land district of the State to determine the character of the lands as to mineral or agricultural uses. Provision is made for the taking up of mineral lands, wherever determined, and also for the separation of such lands from railroad grants. The championship of Dubois of Idaho and Bowers of California will be missed, but their loss will be offset by the absence of Secretary of the Interior Smith and Commissioner of the Gen. Land Office Lamoureux, two of the trinity that beat the bill in the 54th Congress. With the exception of the Speaker of the House, the attitude of the new administration is friendly to the miners.

THE Territorial Legislature of New Mexico has passed a new law, as to locating and obtaining titles to mining claims, that is in line with the work done by other Legislatures in the West, excepting that of California. As to the marking of the claims, it is provided that locators shall cause the surface boundaries of each claim to be plainly marked by eight substantial posts or stone monuments, each projecting at least 3 feet above the surface of the ground, to-wit: One at each corner of said claim and one at the center of each end and side line thereof, each of which posts or monuments shall be plainly marked, so as to show the name of such claim and the direction thereof from each post or monument. The California law just adopted leaves the marking of the boundaries necessary to be made to be decided by the courts in the future, as in the past, and, as a consequence, there will be the same amount of confusion and litigation. The new Territorial law also prohibits the relocation of mines by previous owners, and compels locators to do assessment work within ninety days. Altogether the law is practically the same as that proposed by the MINING AND SCIENTIFIC PRESS last October, much of the language being quoted verbatim.

Notes on the Cyanide Process.

In the issues of this journal of dates Dec. 19, Dec. 26, 1896, January 2, 9, 16, 23, 30, Feb. 6, 1897, appeared an article on "The Solution and Precipitation of the Cyanide of Gold," by S. B. Christy, Professor of Mining and Metallurgy, University of California, Berkeley, Cal., which has attracted unusual attention everywhere. It was published from revised proofs of the paper read at the Colorado meeting of American Institute of Mining Engineers, Sept., 1896.

Under date of March 15th, 1897, Mr. J. E. Clennell, of Salt Lake City, Utah, contributes the following notes on Prof. Christy's article. They are in the form of a letter to that gentleman, and that form is preserved in the following, which, alike with the original article is of considerable interest:

Prof. S. B. Christy, University of California, Berkeley, Cal.—DEAR SIR: After perusing your interesting and valuable contribution to the literature of the cyanide process, I beg to submit the following notes suggested by various portions of your paper. I am well aware that the experiments made in our laboratory at Johannesburg, to which I draw your attention, were not carried out with the scientific accuracy which is possible at a well equipped university, but they were nevertheless regulated as far as possible by the conditions of actual work, and may therefore be of some interest to practical metallurgists.

I entirely endorse your remarks as to the difficulty of handling zinc-ferrocyanide, which would be nearly always formed in practice. In laboratory experiments I have sometimes succeeded in getting this precipitate to settle by adding powdered chalk to the slightly acidulated solution.

The practical recovery of cyanide from very dilute solutions is still, to my belief, an unsolved problem; where it is possible to use the same solutions repeatedly, this recovery, of course, is not of much consequence.

Action of Oxygen in the Solution of Gold.—Your conclusions are entirely borne out by our experience. The rate of solution in all cases where definite results could be obtained appears to depend upon the freedom of access of air. In three parallel sets of experiments, in which equal weights and surface of gold foil were exposed for an equal length of time to equal quantities of the same strength of solution, in watch glasses, flasks, and test tubes respectively, we found that the amount of gold dissolved was greatest in the watch glasses and least in the test tubes. In forty-eight hours nearly double as much had dissolved in the watch glasses as in the test tubes.

In practice we once or twice attempted to use solutions containing alkaline sulphides, which would of course, readily absorb any oxygen present in the liquid, and always got very poor results, sometimes no extraction at all.

With regard to the use of oxidizing agents in practice, we have seldom come across any ore which could not be extracted as effectually without them, provided sufficient time of contact was given.

The ultimate percentage of gold extracted and the ultimate quantity of cyanide consumed is practically the same, with and without the oxidizer, when the reaction has been carried to its limits; *i. e.* when in both cases all the gold capable of being dissolved in cyanide has been extracted. The only use of oxidizing agents seem to be to accelerate the action, and it is obviously a matter of no moment whether the gold is dissolved in one hour or in twenty-four hours, when the mechanical process of leaching requires thirty-six hours.

There is apparently an exception to this in the case of certain ores containing mispickel or other substances liable to yield alkaline sulphides on treatment with ordinary cyanide, the oxidizing agent tending to prevent this result. With ordinary pyritic concentrates we found no advantage except rapidity of solution. The oxidizing agents principally employed were ferricyanide, permanganate, and persulphate of potassium. A few tests were also made with sodium peroxide.

The Bromo-Cyanide Process.—It is not at all clear to me that the bromide of cyanogen in this process does not act indirectly as an oxidizing agent. Undoubtedly, as you state, an immediate decomposition occurs on mixing solutions of potassium cyanide and cyanogen bromide. In our experiments we demonstrated that cyanogen is given off in a volatile form, but whether as free cyanogen, or in combination, as HCy, could not be determined.

We have to choose between these two equations:

$$(1)\ BrCy+KCy=KBr+2Cy,$$

as suggested in your paper, or

$$(2)\ BrCy+KCy+H_2O=KBr+2HCy+O.$$

Our experiments with mixtures of KCy and BrCy showed:

(*a*) That a rapid diminution in the apparent strength of cyanide and also of BrCy took place on standing, both in open and closed vessels.

(*b*) That when the mixture was kept in a closed vessel the whole of the cyanogen originally contained in the KCy could be recovered as an alkaline cyanide by adding a free alkali.

It was also found that the addition of an alkali to a solution of cyanogen bromide decomposed it immediately, not, however, producing an equivalent quantity of alkaline cyanide, but apparently in accordance with the equation:

$$BrCy+2KOH=KBr+KCyO+H_2O.$$

Whether a cyanate is actually produced or not I had no means of definitely determining, but the mixed solution gave with $AgNO_3$ an immediate white precipitate insoluble in an excess of the mixture, showing that a cyanide could not be present.

Assuming that the addition of the cyanogen bromide to potassium cyanide in aqueous solution may give rise to the formation of oxygen or some readily decomposed oxy-compound, the solution of gold may be, after all, in accordance with Elsner's equation in two stages, thus:

$$(1)\ BrCy+KCy+H_2O=KBr+2HCy+O;$$
$$(2)\ 2Au+4KCy+O+H_2O=2KAuCy_2+2KOH.$$

In the ideal case where the gold is present exactly in equivalent proportions, and in a condition to combine as fast as the cyanogen compounds are decomposed, we might combine these two reactions and obtain the result expressed by Mr. Sulman's equation,

$$3KCy+2Au+BrCy=2KAuCy_2+KBr.$$

In practice, however, the first reaction would always go on to an enormous extent in excess of the second. There is, accordingly, always an excess of (hydrocyanic) acid present after the reaction is complete, so that the second equation ought possibly to be expressed as follows:

$$2Au+2KCy+2HCy+O=2KAuCy_2+H_2O.$$

According to Sulman, the thermal energy theoretically developed by his supposed reaction is less than that in Elsner's. If this is the case, it is somewhat difficult to account for the greater energy with which gold is attacked by the bromo-cyanide mixture as compared with ordinary cyanide.

I should be greatly interested to know if you have obtained conclusive proof of the liberation of cyanogen by the addition of KCy to BrCy.

We did not find any marked difference in their effect upon ores between bromo-cyanide mixtures and equivalent mixtures of KCy with ferricyanide or other oxidizing agents.

In regard to the formation of paracyanogen, we found that although this took place to a considerable extent when bromine was added gradually to an excess of potassium cyanide solution, it did not occur when the addition was made in the opposite way, namely, when potassium cyanide, in moderately dilute solutions, was added to an excess of bromine until the color of the latter was just destroyed. The bromide of cyanogen thus produced was tolerably stable, and, unless mixed with cyanide solution, did not deteriorate in strength to any very marked extent in the course of two or three days. We generally used a mixture of two parts KCy to one of BrCy (in accordance with Sulman's equation), which was either prepared just before using or formed in the one itself by running on the separate solutions.

Re-treatment of Imperfectly Roasted Material.—We made a number of experiments on this subject, but the results obtained were very variable. In some cases, where a thorough preliminary washing with water and sometimes with dilute acid was given, it was found possible to extract a fair percentage of the gold, which had resisted chlorination, by treating for a long time with dilute cyanide solution, but I do not think it likely that the action was aided in any way by the presence of free chlorine remaining in the tailings. In the first place, the iron compounds, etc., in the imperfectly roasted material would destroy any excess of chlorine; and if such did remain, it would be assuredly removed by the preliminary washing which, as you point out, is necessary before adding cyanide.

In one set of experiments on the cyanide treatment of concentrates, while from thoroughly roasted material we got an extraction of nearly 90 per cent, from imperfectly roasted material of similar character we obtained, after twelve days' treatment, and notwithstanding a thorough preliminary water and alkali wash, extractions varying from 24 per cent to 35 per cent only.

Solubility of Gold Sulphide in Cyanide.—We have not made any experiments bearing directly on this subject, but our experience as to the difficulty of precipitating gold from cyanide solutions by sulphydric acid is similar to yours. We found that alkaline solutions gave no precipitation at all, while even from acidulated solutions the precipitation was very imperfect.

Estimation of Gold in Cyanide Solutions.—With regard to the estimation of the quantity of gold in cyanide solutions, we found the results obtained by slow evaporation of the solution with litharge and fusion of the residue with a reducing flux to agree perfectly with results calculated from the difference of the assay of ore, or other material tested, before and after cyanide extraction.

The process is tedious, but with solutions weak in gold is more satisfactory than evaporation on lead foil. The method suggested by Crosse of precipitation with silver nitrate, also gave correct results when carefully executed, but was more troublesome when a large number of determinations had to be made. I see that you have used the same principle. We tried the method you describe of acidifying with sulphuric acid, and boiling, but could not obtain reliable results. We also tried precipitation with sodium amalgam, but the results were uncertain.

Precipitation of Gold from Cyanide Solutions.—We made a considerable number of experiments on precipition by means of charcoal, and salts of copper, mercury, lead, etc. In ordinary solutions the gold was precipitated, although imperfectly, by agitation with finely divided charcoal. The other reagents, when used singly, gave little or no effect. A mixture of charcoal, however, with either silver nitrate, copper sulphate, or ferrous sulphate, gave in many cases an almost complete precipitation. On the whole, the combination of charcoal and copper sulphate gave the best results. The effect was practically the same whether the solution was acid or alkaline, and whether the reagents were added together or separately.

The reaction appeared to be complete after about 1½ hours agitation. The solutions used were the dilute cyanide liquors from the Siemens & Halske process and contained originally from .0001 to .0004 per cent of gold.

The methods of precipitation with cupric sulphide and cuprous chloride are new to me, and very interesting, though in South Africa, at all events, the cost of free sulphuric acid would be a fatal objection to their use, except for laboratory purposes. I had seen Prof. de Wildes' patents, but had not paid much attention to them, regarding his methods as impracticable.

Electric Precipitation.—The theoretical objections which you urge against the Siemens & Halske process have not prevented its successful operation on an enormous scale in the treatment of tailings and slimes in South Africa. The necessity for a large surface has been met by the use of very large precipitation boxes, or by the employment of lead in the form of thin strips. The action of the solution on the iron anodes is of little practical importance, and the precipitate settling from the electrolyte, to which you refer, is recovered and treated after a cleanup, which is necessary only at long intervals. Although, as you remark, great technical skill was necessary in the initiation of the process to overcome these and other difficulties, the practical working at present does not involve any higher degree of skill or knowledge than the handling of the zinc shavings in the MacArthur-Forrest process, and is entrusted to foremen with no special knowledge of chemistry or electricity.

Precipitation of Zinc.—Your discussion on this subject seems to give a plausible explanation of the observed facts, viz: the incompleteness of the precipitation when the quantity of free cyanide is insufficient, the evolution of hydrogen, the increase in the alkalinity, and the large consumption of zinc in excess of that theoretically required by the substitution reaction. If you will refer to the article published by Mr. Butters and myself in 1892, from which you quote, you will find that we had drawn attention to the insufficiency of the substitution reaction, though some of the views put forward by us at that time were doubtless erroneous.

Where insufficient free cyanide is used we have sometimes observed the deposition of a white substance which proved to consist mainly of ferrocyanide of zinc.

Recovery of Cyanide by Precipitation with Zinc Sulphate.—This matter was investigated by several chemists in South Africa at an early date, and together with the method by precipitation with ferrous-sulphate formed the subject of a patent applied for in the Transvaal, by Wm. Bettel, I think in 1893. It could hardly be carried out in practice with the immense volumes of dilute solution which we have to handle, and any process involving the use of mineral acids is of course out of the question.

Trusting that an interchange of ideas on these subjects may be of mutual benefit, I am

Yours faithfully,

Salt Lake City, Utah. J. E. CLENNELL.

Why He Can't Sell.

An export house received advices by last mail from their traveler in the River Plate saying: "The reason why I can not send you orders for certain classes of merchandise is that my prices are higher than those being offered here by English and German houses on similar goods. You have sent me a large catalogue of a jobbing house, which has a very complete line in railway supplies, tools and machinery, with prices and discounts. This catalogue is good enough to take orders from, but to be able to sell at the discounts which this firm has given us is impossible. I lost an order for a quantity of railway track material by being 12 per cent higher than an English salesman. The party that bought the goods kindly informed me that they had saved upward of $650 by

not giving me the order. Three days ago I also lost an order for three hoisting engines, which an English maker obtained. In this way I could relate a number of instances in which my prices have not been right. Let me impress upon you that it is of the utmost importance that, in sending me prices and discounts, it should be from the manufacturers, and not from wholesale jobbers, particularly in this line, for the European competitors are in this market strongly looking out for anything in the engineering line, and made of iron and steel."

Tendency of English Capital.

State Geologist Rickard of Colorado has recently returned from England, and in a published interview is credited with saying:

"There is no doubt that there is a very strong undercurrent of feeling in mining circles favoring investment in American mining properties. They have dumped a great deal of money in South Africa and West Australia, and there is a lull in those directions, which will probably receive very little new capital, comparatively, after this. It must not be understood, however, that all the money represented by the capitalization of these companies has been expended in South Africa and West Australia. A great deal of it is left in the shape of uncalled capital, that is, capital subscribed but not paid in, which can be used in other directions, as the law governing the formation of the joint stock limited companies permits the calling in of the entire amount of the capital subscribed. The tendency toward investment in this country is tempered somewhat by the remembrance of President Cleveland's Venezuelan message and the attitude of the Senate on the arbitration treaty. Besides this, a great many people who have invested in American railroad securities are not at all satisfied that they have been treated fairly. They do not take into consideration that American investors were treated just as badly, but charge their losses to sharp practice on the part of Americans. But the amount of money that is coming into England from investments in all parts of the world is so great that they must find new channels for investment, and I am of the opinion that the example of the London Exploration Company, which has made such heavy investments in this country, will be very generally followed by the other syndicates that have been formed there for the purpose of investing in mining properties. The interest paid on government securities is so low that there is a disposition to take some risks in investments that promise to pay more, and America is the only mineral field that has been left untried."

Imprisoned in Mexico.

Under date of the 13th inst., W. Viggers writes from Durango, Mexico: Two years ago last Feb. 12th, I with three others was incarcerated here in Durango under charges of robbery, preferred against us by the then U. S. Consul of this place. We appealed to our respective Governments, English and American; the U. S. sent down Mr. R. S. Chilton, chief of the consular bureau, to investigate the action of the Consul, J. S. McCaughan, who did so, and found them grossly fabulous, and demanded his immediate resignation, but the case not being a political one, the Governments could not further interfere, and thus the case has been dragging along. Both Governments have protested from time to time of the delays, but nothing more tangible than this has been done by the Governments, and, furthermore, the influence of the Governor was thrown against us. The early part of last month, however, the Governor died, and I am now informed that as this trammel no longer exists we can reasonably expect a decision within thirty days. The MINING AND SCIENTIFIC PRESS has been a source of great comfort and has relieved many of what otherwise would have been long, weary hours in this Mexican jail.

The Gold Fields of the Porce River, Colombia.

The Republic of Colombia has long been known to the Spaniards and their descendants as being exceedingly rich in its deposits of gold; but, owing to its geographical location and its climatic conditions, it was only during the past few years that it began to attract the attention of the world at large.

The old Spaniard, who was a wonderful seeker after gold, knew the value of the Colombian mines, and he drew largely from them in gathering the wealth that went to enrich the "mother country" during the palmy days following the conquest of the southern hemisphere. His descendants, too, have profited by his knowledge, and have followed in his footsteps in taking from the bountiful stores that Nature has lavishly placed at hand; and, in almost every section of the Republic, they have continued to operate mines that, since the emancipation from Spain, have yielded, without machinery, a steady stream of the yellow metal, which has swelled the output of the country to more than $700,000,000.

Nearly every State and province in Colombia has its gold deposits, more or less rich, and from some of these deposits have come, at times, yields that almost challenge belief. The stories that have come to the outside world, from time to time, of the gold alluvions of the Darien, Choco, Atrato, San Juan, Cauca, Nechi and Porce, and the rumors set afloat regarding the fabulous richness of these fields and streams, have read for half a century like fairy tales. Yet many of these stories have a basis of truth. Explorations, in recent years, into the regions mentioned have brought to light the fact that, within their precincts, in some places, lie stores of wealth of vast extent, though formidably guarded against the encroachment of man by climatic and other conditions too deadly to face.

The State of Antioquia, though but little known, by reason of its almost inaccessible location, is perhaps the richest State, in mineral wealth, in all Colombia. Situated, it might be said, almost in the "lap of the Andes," and cross-seamed by many spurs from the parent chain, the State presents an almost unbroken area laced with gold-bearing quartz veins of great value, while many of its streams have valley deposits of placer gold of almost incredible richness. Nearly $150,000,000 in gold has been taken out of the mines of this State during the present century, although most of the workings there have generally been limited to surface deposits easy to reach. A very large proportion of this amount has been taken from placer deposits in the valley of the Porce—a river that has long been known to be exceedingly rich in gold.

This river, which seems to be of comparatively recent origin, has its source in the heart of Antioquia, near the city of Medellin, and drains northwardly, between the two ranges of the Cordilleras, through a distance of about 175 miles, to its junction with the Nechi. Through a good portion of this length it is fed by mountain streams and torrents that have cut their way, in deep canyons, across the flanks of the Cordilleras, and that bring into the valley, with their detritus, gold from innumerable veins. As a consequence, the river has, for over sixty-five miles, an almost uninterrupted series of gravel bars, or flats, exceedingly rich in gold. So rich, indeed, are some of these bars that much speculation has been indulged in relative to the source of their supply.

Mining has been carried on in the valley to a greater or less extent for over 300 years. The Indians inhabiting this portion of the continent washed out gold in a crude way, and they, of all the tribes in Colombia, had most gold to sell to the Spaniards. They frequently gave the "conquerors" twenty dollars in gold-dust for a pound of salt, and seventy dollars for a hatchet, and it is said that in one of their villages the Spaniards found more than $20,000 in gold. The Spaniards mined in the valley for many years with good results, and, following them, the natives also. From 1602 to 1620 more than $6,000,000 was washed out here; and, although working has been limited almost exclusively to superficial deposits, easy to mine, the output has steadily increased, until in recent years it has been estimated to run more than $1,000,000 annually.

Individual instances of great returns for working are on record. On the lower reach of the river the natives have taken out, by diving, pans of gravel that yielded more than two pounds of gold. One proprietor, after spending nearly $75,000 for the introduction of water, washed out, in a few days, more than 10,600 ounces of gold-dust, and from a small bar in the river valley, though hardly 500 feet long by 50 feet wide, more than $200,000 was taken. At the Cristina mine, some years since, fourteen men, in thirty hours' work, washed out 118 ounces of gold, while at Barcinos 265 ounces were extracted from about 160 cubic yards of gravel. At Gunyabalito the daily yield in the winter (dry) season, with a small force of men, runs from 44 to 102 ounces; at La Llave it has run from 26¼ to 29½ ounces; at Caracoli, at Socorro Megaron, as much as 132. At San Basilio, in two weeks' work, 764 ounces of gold were taken out in the winter of 1886, and at San Jose 588 ounces were extracted in the working season of 1885.

GREAT EASTERN QUICKSILVER MINE.

(See page 253.)

ORE DRIER OF GREAT EASTERN MINE.

An English engineer of some repute examined and reported on the richness of the Porce river some years since. He estimated that the river contained gold in the proportion of 14.7 ounces per superficial square yard, and that in the lower fifty-mile reach of the river, after its junction with the Nechi, there were more than 4000 tons of gold!

The writer of this paper noticed, during his connection with the surveys of the Intercontinental Railway, the richness of some of the Porce bars, and he has recently been conducting some examinations and tests which show results in keeping with those above described.

At one place, where the bar had a formation of about six feet of loose sand (decomposed granite), mixed with boulders, and below this another formation of gravel, sand and boulders, the upper stratum showed, from the "grass roots" down, an average of $6 per cubic yard, while the lower stratum gave an average of more than $80 per cubic yard. At another place three cubic feet of gravel, taken as average from fifty different places in the lower stratum, yielded 15.81 grams of gold-dust, or about $9 in gold, there being 31.1 grams in one ounce Troy, which is valued, in this gold, at about $18.

At still another place, from 256 pounds of gravel, taken from sixteen different places, 6.4 castellanos of gold-dust were washed out. This result corresponds to a yield of nearly $200 per cubic yard, the specific gravity of the gravel being about two and the weight of a cubic foot about 125 pounds. The former result corresponds to a yield of about $80 per cubic yard. Several wheelbarrows of gravel (three or four cubic yards) at another place gave $435. One batea yielded $7.50 in gold-dust, and, out of several hundred bateas taken, not one failed to show gold in immense paying quantities. Other

tests were made with results equally startling, but those given serve to show the enormous richness of the river valley.

When one remembers that, according to Silliman, Cumenge and Lock, the rich gravel along the Yuba river and at "Pond's claim," in California, averaged only from 34 to 45 cents per cubic yard, while the gravel at such mines as Independence, Todd's Valley, Roach Hill and Iowa Hill ran only from 25 to 71 cents per cubic yard, he can begin in some measure to appreciate the enormity of these figures. The writer is constrained to admit that they read like a fairy tale; and, had not the richness of the river valley been fully demonstrated by the examinations of experts and by mining operations, he would certainly hesitate to give them. Of course, places have been found in California, and elsewhere, where the yield of gold was greater even than the figures given above. These places were known as "pockets," however, and were limited in extent, whereas almost the entire valley of the Porce seems to show the large average given, demonstrating the fact that, through exceptionally favorable conditions, the river has been for many years the reservoir for gold deposits from almost unlimited fields.

The question will naturally be asked, Why, if this river is so rich, has it not been mined out already? As before stated, mining operations have been carried on in the valley by the natives, and by the Indians before them, for more than 300 years. They have been limited, however, almost exclusively to the deposits that were inclined against the hillsides, where bedrock was above the level of the river, and to the old channels that were easy to work. These deposits have been practically exhausted. The rich deposits, however, that lie below the level of the river, and that require expensive machinery to work them, are almost intact, and they have never been worked except by the primitive method of "veraneos," common in the country, which consists in sinking, in the dry season, to bedrock a rude caisson, composed of sticks, earth and vines, and working the gravel thereby uncovered. No regularly organized scheme of mining these deposits has ever been carried out, and for obvious reasons.

Antioquia being situated far inland, and difficult of access by reason of the lofty Cordilleras on the east, south and west, and the almost impenetrable jungles and morasses of the Atrato, Cauca and Magdalena on the north, is almost unknown to foreigners, and even to the natives living on the coast. As a consequence, its mineral wealth has never been made known to the world, to attract miners, except through vague rumors that have come from an occasional wanderer who has found his way into the State by chance. And, when a foreigner, attracted by these rumors, has started to investigate them, he has usually become so appalled by the formidable obstacles presented by Nature in his path, that he has generally turned aside to investigate fields in nearer provinces, report of which has reached his ear. The entire Republic of Colombia is so rich in mineral wealth that the seeker after mines there generally becomes bewildered, as soon as he has entered the country, by reports coming to him, from almost every source, of mines fabulously rich that deserve his attention. As a result, in face of the obstacles intervening between Antioquia and the coast, he generally turns aside to other and nearer fields. The writer knows personally of several expeditions that left the States for Antioquia, and were thus diverted. In view of these facts, very few foreigners have ever penetrated to the rich mines of the State, and those that have penetrated there have usually been unable to provide the capital necessary for working mines. The natives of Antioquia are not, as a rule, mining people, and those who have means sufficient to develop a mine are generally merchants who have made their money in trade, and who are unwilling to risk it in the more hazardous business of mining. There are only a few persons in all Antioquia having as much capital as $200,000 in gold, and they know absolutely nothing of forming large stock companies, such as we have in the States. Furthermore, those that have money live in the cities on the upper tablelands, where the climate is healthy, and they are unwilling, except when necessity compels, to venture into the lower and more unhealthy mining regions of the river valleys. In consequence of this, it is only those, generally, who have to become ruined or crippled in trade that undertake mining operations to recoup their fortunes; and it almost invariably happens, with these, that, as soon as they have amassed wealth enough to return to merchandizing—no matter how fabulously rich their mine or large its returns—they either abandon the work to a foreman or lease the mine to some one they wish to befriend.

The climate, too, which is bad in the river valleys, and everywhere except on the elevated tablelands and the highways, which are almost impassable for machinery, have helped to throw obstacles in the way of mining on any extended scale.

All of these things have combined to prevent in Antioquia, and even in Colombia, a mining "boom" that would have led to the working of the alluvial deposits of the Porce. That such a "boom" will soon occur, however, is easy to be seen. The rich discoveries of silver which enriched Chili were made from 1825 to 1848; the gold alluvions of California were discovered in 1848; those of British Columbia in 1858; the rich silver mines in Nevada, which have lowered the price of silver, were discovered in 1859; those of Bolivia in 1860; the rich gold deposits of Guiana and Venezuela in 1866; and those of the Transvaal within recent years. Impelled by recent financial agitation in the States and elsewhere, the world is now "casting about" in every direction for new gold fields; and Colombia's day appears, therefore, to be near at hand.

When that day shall have come, and the present primitive appliances and methods being discarded, improved machinery and recently discovered methods of mining shall have been applied to the working of the Porce and other Colombian streams, and to uncovering and extracting the gold from the vast lodes of quartz that are now lying hidden in Antioquia and other parts of Colombia, it is no hazardous venture to say that the world will view the results with unbounded amazement.

In order to prevent a misconception of the situation, it is eminently proper, before closing this paper, to warn persons against going to Colombia to mine without reasonable means. While the mining laws of the country are exceedingly liberal to both natives and foreigners, and while there are many rich mines to be discovered and claimed in nearly every section, it is still true that in Colombia, perhaps more than in any other country in the world, money is needed, especially for mining.

As for the valley of the Porce, there is probably, in all this territory, not a yard of soil that is not already taken, and nearly all of the river bars of any value are owned or controlled by a wealthy firm of native mine owners, who do not care to sell them except for prices commensurate with their value.—J. D. Garrison in the Engineering Magazine.

Forest Reservations and Mining.

There have been attacks made upon the reservations of forests under the proclamation of President Cleveland on February 22 in all the States interested. All the papers which have opposed them have done so mainly upon the ground that the President's proclamation would prevent prospecting or mining on lands in question. Similar arguments have been advanced by Senators from all States interested except California. This contention would seem to be wrong, and it would appear that other motives inspire the opposition. The Forestry Commission in its report says:

"The Commission fully recognized the fact that the forest reserves established and proposed can not be maintained unless a plan can be adopted under which their boundaries can be modified so as to take from them all lands better suited for agriculture than for the production of forests, and under which their timber can be made available for domestic and commercial purposes, *and valuable minerals can be freely sought for and mined within their boundaries.*

"The Commission is now engaged in perfecting a scheme of forest management which it believes will make the administration of the reserves possible, and which in due time will be submitted. It believes that the solution of this difficult problem will, however, be made easier if reserved areas are now increased, as the greater the number of people interested in drawing supplies from the reserved territory, or in mining in them, the greater will be the pressure on Congress to enact laws permitting their proper administration. For this reason it is the unanimous opinion of the Commission that the establishment by proclamation of the reserves described above is now a matter of the utmost importance to the development and welfare of the whole country."

The following statement, in answer to questions about these vigorous protests against the forest reserves, is made by Gifford Pinchot, a member of the Commission which recommended the reserves, and its secretary:

"The attack on the forest reserves declared by ex-President Cleveland on Washington's Birthday is founded on a misunderstanding. There is a fundamental misconception of the objects of the reserves and the reasons why the Forest Commission of the National Academy of Sciences recommended their establishment. The members of this Commission understand as fully as any one can that forest reserves permanently withdrawn from use would be wholly unworthy of being maintained. The only reason for reserving any area must be that it will be more useful to the people as a reserve than as part of the public domain. With that idea clearly in mind, we have been considering for several months past the question of making all the reserves, both these and the 17,000,000 acres hitherto proclaimed, contribute to the utmost to the welfare of the regions in which they lie, and work on a bill for submission to Congress to open the reserves to use, while providing the necessary means for the preservation of the forest, is so far on toward completion.

"*The Commission's Statement.*—An official statement of its position was recently made by the Commission to a conference committee of the House and Senate which was considering the matter of the newly proclaimed reserves. Omitting those parts which refer to specific amendments to the sundry civil bill, in which the provision to abolish the reserves was inserted by the Senate, this statement is as follows:

"'It has never been the desire of the Commission to restrict the natural development of any resources contained in the reserves, but, on the contrary, to recommend the widest use of all their resources, mines as well as all others, compatible with the preservation of the forests upon them.

"'The Commission made its recommendations after thorough study of the data available in the Geological Survey, the General Land Office and the Department of Agriculture, supplemented by a sufficient investigation on the ground, continued through several months. There has been nothing in the nature of hasty judgment, but the decisions reached have in every case resulted from careful and adequate study of the questions involved, and the Commission desires to reiterate them here. It must not be understood that no land has been included in these reserves which should eventually be devoted to other uses. From the necessities of the case such temporary inclusion was unavoidable, and was, and is, a part of the policy of the Commission to recommend the recession of all such lands in all the reservations as soon as surveys can be made and it can be accurately known where such lands lie.

"'There is at present no legal practicable means by which small settlers may obtain from the public lands the timber which they need. Large corporations, on the contrary, through the permit system and otherwise, have excellent facilities. The intention of the Commission is to recommend such legislation as will remedy this evil.

"'It will not be denied that great good will result to the Western States, as well as to the nation at large, from the preservation of the Western forests. The chief danger to them is from fire, not from the axe. Fire can be controlled by the Government, and by it alone. It follows that Government control of certain of the Western forests is indispensable.'

"*Not to Remain Undeveloped.*—The intention of the Commission is to prepare and recommend a plan by which the whole value of the reserves may be used for the good of the people, and by which none of their resources will remain undeveloped. We have no desire to protect these forests against use, but against destruction. It must not be forgotten that the judicious cutting of the timber is essential to right forest management, and that the best of all ways to insure the protection and preservation of a forest is by use.

"The action of the California delegation in Congress shows, as well as anything can, the public approval which forest reserves have acquired in parts of the West, and their value to agricultural and other interests. By special request of the California Senators their State was omitted from the Senate amendment abolishing the reserves, and the discussion in the House showed that the California Representatives were also prepared to resent any attack upon the reserves in California. In New York the Governor has urged, and the Legislature seems about to pass, a bill appropriating $1,000,000 to purchase forest lands at the headwaters of streams, for the sake of protecting the water supply. In view of these examples of the real value of reserves in the opinion of the people, East and West, and with the knowledge that there is no desire to blockade the resources of the reserves, of whatever kind, the greater part of the irritation which has followed the proclamation will, I hope, gradually disappear. Great corporations which have been in the habit of taking vast amounts of Government timber free, under the permit system or otherwise, will undoubtedly continue to complain, but in this case it is not the infringement of any right which make the difficulty, but merely the discontinuance of a gift.

"During the discussion in Congress it was repeatedly said that the Commission had acted from too meager a knowledge of the new reserves. I want to say that five members of the Commission spent from three to four months in the field, and all of that time that was not required to move from place to place or to consult with scientific or mountain men was spent in the woods on the areas since reserved. Long trips with pack trains (one of twenty-five days) were made, and two on foot, with the result that thirteen reserves recommended all but two are personally known to members of the Commission. Of these two, one was laid down by the State Engineer of the State where it lies, and in the other the character of the forest was well known from the study of adjacent areas, and the region itself had been thoroughly and repeatedly described to us by the men best able to do so."

THE iron industry in the eastern part of Cuba overshadows all other interests. Two American companies in that vicinity employ 1400 men, and ship to Pennsylvania mills nearly 50,000 tons of ore per month. The ore is very rich. From 1828 to 1840, Cuba also shipped to this country over $3,000,000 worth of copper ore, but this branch of trade has lapsed considerably. American capital was busy in the development of numerous new deposits of manganese ore when the revolution broke out.

"Trinidad, the Gateway."

In the southeastern part of Colorado, a few miles from the New Mexican line, lies Trinidad, the metropolis of that section, and the natural gateway to the La Belle mining district. The illustration of the Mexican adobe and oven might indicate that that was a slow country, but there is nothing slow about the business men of Trinidad or the gold that is now being taken out south of there. From the El Moro coke ovens, illustrated on this page, is annually shipped great quantities of coke through Colorado, New Mexico, Kansas and Nebraska. The coal and iron deposits of that section make manifest its future commercial importance. The La Belle mining district, the oldest gold mining section on the continent, is reached by the Union Pacific, Denver & Gulf Railway, which affords direct communication with the Gulf of Mexico.

Tributary to the La Belle district is the "Red River country," remarkable mainly for the diversity of its ores. Years ago a copper smelter was erected at this point, but was abandoned in the search for silver. Much copper ore was mined in the vicinity, as is shown in the dumps before a number of old mines which were once abandoned, but are now being relocated and opened up. In the walls of this canyon gold veins have been opened, among others, the Franklin Mill and Mining Co., operated profitably. A cut of the flume appears. The ore bodies are deemed of sufficient extent to warrant the erection of a chemical reduction works, which is being backed by a Philadelphia syndicate and will be a modification of the cyanide-chlorination processes.

The Denver & Gulf Railway Co. has done a great deal in the way of developing this district, and is an example of what a live railway corporation can do in making new business, thus helping itself and the country to which it looks for local trade.

FRANKLIN M. & M. CO.'S FLUME, LA BELLE, N. M.

MEXICAN ADOBE AND OVEN.

Railroads Needed.

To the Editor:—We have read your article in the issue of March 13th on muddy roads with much interest. We have had an experience like your correspondent's on the road he speaks of, between Ione and Sutter Creek—only in our case, when told by the driver to get out and walk, we found hardly any earth to walk on. A friend writes us from the interior that he saw twenty wrecks of teams between Chinese Camp and Oakdale, and accounts from about everywhere else agree in declaring that the condition of the roads is simply horrible. It is well, of course, to talk about improving the roads, but we fear that this is a remedy that will not cure, at least in winter. What the mining towns of Sutter Creek, Angels and Sonora need is railroads. It would not take over sixty to eighty miles to connect all these places with civilization, and it is strange that such lines have not been built. The Denver & Rio Grande and Canadian Pacific require no stimulation on this head; and were the camps named or Randsburg in their territory, there would be little complaint as to the difficulty of reaching them in summer or winter. The stage ride from the railways to these towns is a great bar to the investment of capital. People of means like to be able to visit properties with comfort and pleasure, and many a man with money, after having been jolted and knocked about in a rickety stage over a stony or rutty road, has shaken off the dust against a locality in which the torture was inflicted and sworn he would not repeat his experience if the mine he went to see could be had as a gift. With easy access and cheap freights, the mining towns of California would increase tenfold in business, and it is strange that the railroads have not hitherto been able to recognize so ostensible a fact.

"Alpha."

San Francisco, March 23rd, '97.

"Alpha" is right. About a year ago this paper had a series of editorials, giving facts and figures in detail, showing how cheaply narrow gauge roads have been constructed in mountainous regions, and how satisfactorily they operated. Railroads with a much narrower gauge than that between Colfax and Grass Valley are being successfully operated elsewhere, and the matter is worthy of general attention and immediate action.

Ancient Coin Alloys.

Alloys of gold and silver, even if rich in gold, have a silver white color, consequently in ancient times gold was generally present undetected in silver coins. The parting of gold and silver was discovered in the 16th century, but even then it was not found possible to prepare 24 carat gold. Most of the medieval silver coins are rich in gold, containing 0.02 per cent, or even more Stolba has found in old Bohemian silver coins, dating from 1037 to 1120, as much as 0 42 to 0.45 per cent of gold. This is very remarkable, for the Bohemian silver mines then worked yielded silver free from gold. It is probable, therefore, that these old Bohemian silver coins were made out of remelted Arabian ones.

The United States Geological Survey uses a band saw, the invention of the department, for cutting up specimens which come for microscopic examination. It is an endless steel wire, between an eighth and a sixteenth of an inch thick, running at very high speed over two wheels. Water and emery are fed on the wire as it runs.

EL MORO COKE OVENS, TRINIDAD, COLO.

Scientific Progress.

The Origin of Petroleum.

At a recent meeting of the American Philosophical Society, in Philadelphia, papers were read by some of the most eminent oil experts in this country—men who have devoted years to the study of the subject. The subject for the evening was "The Genesis and Chemical Relations of Petroleum and Natural Gas." The discussion was opened by a paper read by Prof. S. P. Sadtler, who was followed by Prof. S. F. Peckham of Ann Arbor, Mich., Prof. David T. Day of Washington and Prof. C. F. Mabery of Cleveland, Ohio. The papers and discussion took a wide range, and the opinions of eminent experts in Europe and America were cited, not only upon the origin but also upon the constituents of petroleum. But little was said about natural gas, which was simply referred to as the same substance in another form. The opinions expressed and cited show that there is no agreement, or anything approximating it, among scientific men as to whether it is a product derived from organic matter, animal or vegetable, or from inorganic matter, or from both. There seemed to be abundant evidence in favor of any of these derivations, and as Prof. Mabery, who spoke principally on the chemical constituents of petroleum, showed that there were very great differences in the oils from the different fields, the conclusion would seem to be warranted that they are derived from both organic and inorganic substances, and also from a combination of them. It is also probable that the processes are as varied as the elements from which they are produced. There is no end of literature upon the subject. One of the earliest writers, Baron von Humboldt, described the petroleum springs on the coast of Venezuela, and believed the oil was distilled from the primitive rocks. A French writer at a somewhat later date connected the rocks with igneous and eruptive agencies. Dr. Sadtler, who gave a recapitulation of the various theories advanced, mentioned as the simplest the emanation theory, that is, it is a cosmic product formed in the crust of the earth by the direct union of hydrogen and carbon. That theory, however, does not find much credit at present. Another theory was that the metallic carbides in the depths of the earth, coming in contact with water filtered from the earth's crust, would produce the necessary conditions.

Among the organic theories the decomposition of peat covered with sand was mentioned. Prof. Peckham spoke of the theory of the production of petroleum from the remains of marine animals. He was not prepared to say that any formula was of universal application. Bitumens in some instances were produced by the decomposition of animal remains in the places where they were originally produced. There were also primary distillations produced by hot steam in past periods. In some instances bitumens had been transferred and stored by hot steam and pressure. Much geological and chemical research would be necessary to determine all the varied processes which have produced the many varieties of petroleum that have been discovered.

Utilizing Wave Power.

For many years past engineers have endeavored to devise a practical plan or apparatus whereby the actual power resulting from the action of waves and tides may be conserved, and the energy either utilized immediately or accumulated and stored for future usage. Granted that an efficient apparatus can be made available, it is obvious that the purposes to which it may be applied are many. In the designing of power generators, even those utilizing the energy of falling water, it is necessary, from a commercial point of view, that their efficiency should approximate with some amount of accuracy to the theoretical value of the source of power. In the designing of wave motors and tide motors, however, this relative efficiency can in some measure be ignored, for the power available is so vast that the successful utilization of even a small fraction of it would create an almost entirely new set of industrial and manufacturing conditions in those districts in which tide and wave power is available. Ultimately, of course, the inventor would strive to perfect his apparatus so that the results bore some close relation to the potential energy. At present, however, as we have said, he is untrammeled by such considerations, and his leading aim is to devise some means of making perhaps the greatest of Nature's powers available for the use of man.—Industries and Iron.

Temperature of Arid Regions.

Willis L. Moore, chief of the United States Weather Bureau, expressed the opinion, in a recent paper on "Some Climatic Features of the Arid Region," that the ideal climate, as regards equality of temperature and absence of moisture, does not exist in the United States. Such a climate, he says, is found only on the plateaus of the tropics, as, for example, at Santa Fe de Bogota, in Colombia, where the average annual temperature is about 59°. The southeastern part of the United States has the nearest approach to this ideal temperature. Even in the Southwest the range of variation is too great, and the rainfall reaches from nothing to a point greater than is to be found in the Eastern or Middle States. Ranges of temperature depend upon the dryness and clearness of the sky. Thus, while the summer temperature of the Southwest is high, the real degree of heat as felt by animal life is not indicated by the common thermometer, but by a mercurial thermometer, the bulb of which is wet at the time of the observation. In this manner is shown the temperature of evaporation, the sensible temperature, and, more nearly than can otherwise be indicated, the actual heat of the body.

The inland valleys and plains east of the Rocky mountain foothills have an average summer temperature of from 65° on the north to 80° on the Gulf coast. While the daytime heat in the arid regions seems excessive, it is not really so, owing to the extreme dryness of the atmosphere. It is, as is well known, the moist, "sticky" heat that is prostrating. Again, in these regions the radiation at night is so great that the temperature is made tolerable, and, indeed, comfortable. Estimated by the temperature of evaporation, the arid region is the coolest part of the country. The falling of temperature from the time of the greatest heat is irregular and not at all dependent upon longitude reckoned west from Greenwich. Mr. Moore cites as an example of this fact that the temperature falls as much by 6 P. M. in Denver as it does by 8 P. M. in New York and Philadelphia. This is accounted for in the greater daily range and more rapid rate of cooling at elevated stations.

ARTIFICIAL LIGHT should be essentially different from sunlight. It is natural for the optic nerve, fatigued by daylight, to be relieved by twilight and darkness, but the use of the eyes can be safely continued for some hours longer if an artificial light, that is soft and as free as possible from actinic rays, be employed. The greenish-blue light of the gas mantles in most common use may prove injurious to the eyesight in the course of time. A pharmaceutical writer adds that the light of acetylene—not yet a safe or economical illuminant—to be remarkably free from actinic rays, as is also the light from paraffine.

A BALTIMORE man said his arm had been broken by a railroad car and demanded $3500 of the company. He was offered $100 and refused it. Then the company thought of the X-ray, which brought out the bones in plain sight, showing that they had never been broken. Then the man offered to take $25, but didn't get a cent.

Electrical Progress.

Electricity in Safe-Breaking.

About three years ago attention was called to the possibility of using an electric current for the purpose of opening so-called burglar proof safes. In investigating the possibilities of using electricity upon an explosive-resisting safe, it appeared that it was not at all a question of possibility—that admitted of no doubt—only one of probability and practicability. Suggestions were made that burglars would soon use the enormous heat of an electric arc for drawing the temper or penetrating the sheets of steel vaults and safes. The opinion expressed has now received verification, for recent experiments have shown an arc of forty to fifty volts, with a current of 300 to 500 amperes, penetrate in three to ten minutes safe walls 3 to 6 inches thick, and as a demonstration of the masses of metal which could be operated upon a rough steel ingot, perhaps 6x7x10 inches, was penetrated with a diagonal jagged hole from 1½ to 3½ inches in diameter, the thickness of metal pierced being about 8 or 9 inches.

What construction can resist this concentration of heat? The hardest steel is penetrated easily, even more easily than the softest iron, while the cast metal used in the heretofore invulnerable safe melts and runs like water, making, from its very nature, an easier safe to open than those built of the rolled metal, which, as is well known, remains plastic under a high degree of heat, and has not the tendency to flow from the arc and leave an entirely unobrtructed passage. In penetrating the wrought iron or mild steel it was frequently necessary to allow the arc to play on the semi-plastic mass being melted, to keep it from congealing and preventing further progress. This took somewhat longer time. The cast safes, owing to the fact that the metal was necessarily designed to flow, in order that the safe could be cast from the pattern, did not resist the arc nearly so long for a given penetration. The metal readily flowed, and a hole large enough to permit the safe to be opened was quickly made; this without noise or aught to give warning.

Electric Tramways in Paris.

The question of increased facilities for local transportation in Paris is being agitated, especially in view of the anticipated requirements for the coming exposition. There has been prepared a scheme by MM. Cauderay and Renard for a system of electric tramways which shall meet all the demands of the situation. Apart from the local features of interest which the plans present, it is worthy of note that the scheme includes the idea of combining both underground and overhead trolleys with the storage system. Each car is to carry a storage battery, which may be charged at any time when in connection with a trolley wire, and the current from the storage battery is to be used to carry the car over that portion of the city in which no wire, either overhead or underground is permitted. Wherever a subterranean conduit is permissible, it is to be constructed, while in the suburbs the overhead wire is contemplated. The practicability of the combination scheme is yet to be determined, but it is possible that in some such method the problem may be solved with justice to all concerned, not only in Paris, but on this side of the Atlantic as well.—Engineering Magazine.

W. E. WILSON, F. R. S., AND G. F. FITZGERALD, F. S. R., have communicated to the Royal Society of England a paper on the observed effects of altering the nature and pressure of the atmosphere surrounding an electric arc light. The authors describe experiments upon the arc light in air, oxygen, hydrogen and carbonic acid gas. It has been found by previous observers that NO_2 is formed when the carbon arc is produced in air; and these experiments prove that, with air and oxygen at high pressures, such large quantities of NO_2 are formed in this way that observations of the radiation at these pressures was impossible. Experiments in the same way with hydrogen showed that in this gas the arc is long and thin, with a red line down the center. Observation of the crater of the carbon in hydrogen at high pressure was impossible, because, in the first place, only a very short arc could be maintained; and, secondly, soot trees and a deposit of graphite carbon all round the margin of the crater at high pressure completely hid it. The experiments in carbonic acid at high pressures were the most satisfactory, but owing to a variety of difficulties it was found impossible to decide with certainty whether the crater itself was hotter or colder at high pressures. A thermodynamic investigation of the conditions of the electric arc in an atmosphere at high pressure indicates that by the theory the temperature of the crater should rise 220° C. for every additional atmosphere of pressure, and that the radiation should be double for an increase of four atmospheres. Such a large increase would have almost certainly been detected by the authors, but nothing of the kind was noticed.—Industries and Iron.

AN electrical engineer, who has just returned from a year and a half trip abroad in the interest of the export department of one of the leading electrical companies, gives his views as to where American manufacturers of electrical goods can increase their export business, and says: "While the manufacturers of electrical machinery in this country have exported goods to a great extent to South America, Japan, and, to some extent, to southern Europe, they have, up to date, almost entirely ignored the vast markets of the northern part of Europe, Denmark, Sweden, Norway, Finland and Russia. These countries, bordering on the Baltic, excepting Norway, have a population of many millions. Electricity is there used to a great extent and for numerous purposes. The machinery is, in most instances, imported either from Germany or England. Our manufacturers have the idea that the cheap European labor bars out American goods. This is wrong. The fact is, we are far ahead in skilled labor and in working machinery and tools, and we surpass many of our competitors. These facts should enable us to compete. We are to-day doing a big export business through English and German houses. American manufacturers should cater either directly or through reliable export houses for export business and not let foreigners derive the benefit of their labor and obtain the profits that should remain at home."

IN designing apparatus for electric heating and cooking it is necessary to consider all the laws of heat—its conduction, insulation, absorption and convection—as well as those of electricity. The question of latent and specific heat must be carefully weighed when designing electric heaters or cookers for special purposes. A pound of water will absorb much more heat in a rise of 100 degrees temperature than will a pound of copper or iron. The electric heating of water is more expensive than the electric heating of iron. The economy of electric heating and cooking depends upon the construction of the apparatus so that the heat is all concentrated upon the special work in hand and for the minimum of time possible to do this work. The heat should not go anywhere else than where used before thoroughly ready to use it.

CHAIR-CAR No. 1432, Santa Fe route, is equipped with a new system of electric light, generated from the car axles. When the train is running the light is taken direct from the dynamo, and when running at less than eight miles an hour the light is taken automatically from the storage battery. This dynamo makes over 4,500,000 revolutions on the round trip between Chicago and Denver.

Mechanical Progress.

A New Method of Dressing Car Wheels, Axles, etc.

The art of dressing the harder kinds of metal, such as iron, in the cold state has within historic periods depended upon the grindstone, and it is not until comparatively recent years that other means have become known which reduce the length of time required by the expenditure of more power, or, in other words, since hand labor has been replaced by machinery.

The working of iron in the cold state by means of machinery to cut or dress it has largely supplemented the art of working hot iron for more than a century, and has been the only known means except the grindstone for dressing and finishing iron and its various alloys until late years. The greatest departure from the work of the grindstone was probably made by the introduction of the emery wheel, which differs from the grindstone in being revolved very rapidly, and therefore in doing more work in the same time, thereby replacing time by power; but, on the other hand, it is like the grindstone, in that it loses much more of its own substance than it removes from the material operated upon. A further advance was made in the art by the introduction of the blind saw for cross cutting bars of iron or steel, such as rails, etc., in the cold state. In its operation, the most notable feature is, that less of the operating material is displaced than is removed from the material operated upon, even though the latter is the harder substance. This may be looked upon as being, until recently, the latest form of the attempt to substitute power for time in the manipulation of cold iron or steel.

What appears to be a further distinct advance, inasmuch as the effect is not only to remove more metal in a given time, but also to leave the surface so dressed in more perfect state than heretofore for the work they are intended to perform, is accomplished by the Sibbald machine and process which was primarily intended for dressing journals and other forms of finished work.

A description of the machine may be given as follows. A ring about 33 inches diameter of mild steel (of about 0.65 per cent carbon) is fixed like the tire of a locomotive driving wheel on a suitable center, which is mounted on a heavy shaft, and has its perphery turned to produce the proper profile on the wheel to be operated upon, and very carefully balanced. The disc thus formed is driven at a speed of about 3000 revolutions per minute. The wheel is set in a suitable carrier and is revolved slowly, about two or three revolutions per minute, so that the surface when brought against the operating disc will move in an opposite direction. The wheel and disc are then pressed together with a force sufficient to cause friction enough to consume a great part of the power which is driving the disc, and thus convert the power into heat. The disc cuts or rubs off the metal of the wheel operated upon, and leaves a smooth finished surface, which by the pressure and heat is closed and hardened to a considerable degree and to a depth of 0.01 of an inch or more, depending on the grade of the steel worked upon.

The principal constructive feature in the machine itself is the manner in which the friction on the journals of the disc, which would result from the combined great pressure and high speed, is overcome by a system of forced lubrication, carried out by pumping oil into the bearings at the point of contact, thus causing the shaft to revolve upon a film of oil which flows out at the ends where it is collected by centrifugal force and returned to the pumps.

COMMISSIONER OF PATENTS SEYMOUR has issued an account of the country's industrial progress, and gives a summary of inventing devices in use. In 1866 there were 6616 patents taken out, in 1895 22,057. Electricity has produced 18,700 patents, bicycles 2621, elevators 1736.

A Delicate Instrument.

One of the most exquisitely sensitive instruments ever devised has just been set up by G. Henning of New York, known as the mirror-testing apparatus, designed to test and register the expansion or stretching of metals under heat or strain. It is capable of measuring the strain caused by the footfall of a pedestrian crossing the Brooklyn bridge.

This instrument is simple, its chief part consisting of little mirrors carried on spindles, which in turn, are fastened to a pair of knife edges, so that the slightest change in the position of the knife edge causes a deflection of the mirrors. For the rest there is an ordinary reading telescope, to which is attached a finely graduated scale, reading down to 1-100,000th of an inch. When the knife edges are lightly clamped against the object to be tested, say a bar of steel, and the latter be stretched or expanded, the knife edge will change position, the mirror will be deflected, and as the latter is looked at through the telescope from a distance of 5 or 10 feet, the graduated scale which the mirror reflects seems to move up and down. By watching these movements the stress on the bar is easily calculated. An instrument so sensitive as this, and dealing with graduations of 1-100,000th part of an inch, will register the most minute changes of temperature. The mere proximity of the body will, by the expansion due to the heat radiated therefrom, introduce errors, and the utmost precaution must be taken that the temperature of the room in which the observations are to be made does not vary while they are in progress. Moreover, nervous or excitable persons cannot use such delicate micrometers at all, and even for others considerable experience is necessary before one can become expert in their use and their delicate readings be of practical value.

A. R. BENNETT has devised a little heat engine of greater sensitiveness than the radiometer of Crookes. The motor begins to revolve the moment it is exposed to daylight in the open air, whether the sun is shining or not, the action being due to convection current set up by the slight heating of the metal surfaces and consequent expansion of the air thereon while the glass shade covering the working part is not heated and condenses the air. In one modification, surplus heat is automatically stored by day for use at night, such a motor having continued to rotate throughout three favorable months without stopping day or night. The instrument varies in speed with barometric pressure and moisture of the air, is capable of making the dew point, and can be used as a calorimeter by cooling it to the temperature at which rotation ceases, and then suspending pieces of heated metal inside. In this way the specific heats of substances can be accurately compared, the number of rotations caused being in direct proportion to the amount of introduced heat. The instrument also promises to be of service in measuring the comparative heat-retaining power of textile fabrics, boiler compositions, etc., and the relative heat conductivities of thin threads and wires, while it is now being employed in a series of interesting tests of the comparative sensitiveness to convection effects of various gases.

OIL-FED TWIST DRILLS are among the latest tool novelties put on the market. As described in Cassier's they are provided with small tubes passing down the body of the tool from shank to point. Oil is forced into these at the shank end, and by its escape at the bottom of the hole being drilled it lubricates the cutting edges of the drill far more effectively than is possible by the older method of squirting oil into the hole from a can. A minor advantage claimed for the tool is that the oil, as it flows outward through the hole, assists in the removal of the chips. Drills of this kind, like the lubricated milling cutters, should give good accounts of themselves.

THE "self-regulating wave motor" has again been "brought to a state of perfection," this time by Parvin Wright of Los Angeles, Cal.

Practical Information.

Hard to Figure Out a Rule.

The State Department has completed the work of collecting and publishing a complete set of reports by United States ambassadors, ministers and consular officers abroad, exhibiting in concise form the financial systems of all of the countries of the civilized world, with full explanatory notes by the officials of the effects of the different kinds of money used as standards of value upon the industrial population of the respective nations.

Nineteen nations are treated in this last volume, and from a summary of the conditions in these countries the following facts are extracted:

Argentine Republic uses inconvertible paper as a standard of value, though the mints are open to gold. In the last 10 years prices have advanced as measured in this standard, and wages as well.

The British Australian colonies with the gold standard show a mixed result. Prices of agricultural products advanced in the decade in New Zealand, while they declined in Victoria; wages declined in the first case and remained stationary and high in the latter.

In Bolivia, with a single silver standard, though there was no data on the effect of wages, it appeared that food supplies, except for imported articles, were cheap, while clothing, house rents, drugs, and hardware were high.

From Brazil, with a nominal gold standard, but no actual coinage, data is wanting.

Cape Colony has the single gold standard, though without mintage. There the wages have increased 15 per cent in the decade and there has been an increase in the cost of living, with heavy fluctuations in the export commodities.

In China, without any legal standard, silver weighed for large transactions and copper for small sales, are used in business. There has been an increase in the silver price of imports; no difference in the price of Chinese products, and wages show no change, though new avenues for employment have been opened up in manufacturing.

Denmark, with the single gold standard, shows an increase of 10 per cent in wages since 1884.

India, with a silver standard, though with mints closed except to the government, shows an increase in the prices of some articles and a decline in others; wages show the same variation. The increase in prices is in raw exports, and in imports, except tea, and the decrease in tea and sugar.

Japan, with a silver standard, shows a general advance in prices and in wages as well. There was a decline in prices between 1884 and 1887 attributed to the curtailment of paper money and a general advance from the latter date up to 1895. The increase is said to be due to a scarcity in the crop. The Japanese Consul says that he is authorized by his Government to state that notwithstanding the recent adoption by Japan of a gold standard of currency, she will continue the use of silver and that all silver now in the possession of his Government will be coined into subsidiary coins.

Persia has a silver standard and in that country wages and prices both advanced in the past 10 years. The currency is, however, greatly depreciated and the country is much poorer than it was 23 years ago.

Peru uses silver only and prices increased as measured in that standard, while Portugal, with a gold standard, showed a 25 per cent increase attributable to the fact that the actual money in use is paper.

Salvador is now using silver, but steps have been taken to substitute gold. Meanwhile prices were advanced in a marked degree, owing, it is said, to depreciated currency. The only labor in Salvador is employed on farms and wages in that case were advanced slightly.

Gold is the standard in Sierra Leone and prices generally declined, owing, it is said, to overtrading and the falling off in exports to Europe.

In the South African republic, with a gold standard high prices obtained for domestic goods. Imported articles are said to be "reasonable" and wages are high in the skilled trades, mining, and building.

Spain uses a double standard, gold and silver: prices have generally advanced and only expert labor has advanced its wages.

The high prices are attributed to the fact that Spain is constantly importing a large quantity of the necessaries of life and because of the premium she must pay on them; prices of living are 12 to 20 per cent higher than if the currency were at par.

The gold standard in Sweden was accompanied by declining prices, but advancing wages, while Venezuela, with the double standard, though with closed mints, showed a mixed result; wages stationary and prices advancing in some articles and declining in others.

Bacteria.

Zoologists and botanists alike laid claim to the bacteria until comparatively recent years, but the zoologists were forced to yield to their botanical brethren, and the curious little organisms popularly known as "microbes" are now classified, almost without question, among the simplest of the plant forms, and as near relatives of the algæ. The most common form of bacteria is rod-shaped, though others are spiral, spherical and egg-shaped. In size they vary considerably. Some of the larger forms are $\frac{20}{25000}$ of an inch in length, while one of the smallest is about $\frac{}{500000}$ of an inch. To give a rather more definite idea of the minuteness of some of these organisms, imagine 1500 placed end to end, hardly reaching across a pin head. Extremely powerful lenses must consequently be brought to bear upon them before they will yield up the secret of their life history and workings; and, as the little bodies are almost transparent, the microscopist is obliged to stain them with some dye to render them anything but shadowy and indistinct. Some, however, massed together in large quantities, make a most brilliant showing. The phosphorescent lights seen in many bodies of water and on decaying wood or vegetables are produced by immense numbers of massed bacteria. Other kinds have a blue or greenish tinge, and one of the most striking of all is scarlet in color, the little cells collected in large quantities on certain moist organic substances having the appearance of blood drops.

What Is a Gallon?

In the issue of Feb. 27th editorial reference was made to a bill introduced in the California Legislature regarding a "miner's inch," which raised the question: "What is a gallon?" That comes up as a matter of some moment in an interesting and curious suit brought by a Chicago paint firm against the National Linseed Oil Company, to recover the value of alleged short deliveries of oil. That particular case hinges on this point: The United States standard gallon contains 231 cubic inches. This amount of water at 60° Fahrenheit, the accepted temperature, weighs 8¾ pounds. Raw linseed oil, consequently, with a specific gravity of 932, should weigh 7.766 pounds. It has become the custom in commercial transactions to consider 7½ pounds the weight of a gallon of the oil, which is really more than a quarter of a pound less than the actual weight at the standard temperature. The suit is to recover this difference in purchases extending over a long period, estimated at a money value of $25,000.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: In Volcano district work was resumed some time ago by J. W. Lyle on the Fogus property.

The McVay mine, which is located in Clapboard gulch, has been equipped with a roller mill and is now crushing ore.

W. F. Detert, the superintendent, states that the repair work at the Zeila cannot be finished before May 1st, and perhaps not until a later date.

E. M. Allen et al. have sold the Moore mine to William Fleming of Chicago.

The hauling of ore from the Argonaut to the Zeila mill yet continues. The Zeila mill is now running on the second 500-ton test crushing. The managers of the Argonaut are grading the foundation for a 40-stamp mill which they contemplate erecting as soon as the weather will permit.

At the American mine on Sutter creek the new stamp mill was started up last week by Wilfred Dennis. In the bottom of the 70-foot shaft the vein is 8 feet wide.

The California mine at Drytown has been contracted to the Pocahontas Improvement Co. for the sum of $33,400. This property was owned by Mrs. E. A. Miller, John L. Richards, William F. Richards, P. K. Hinkson, Frances Cox and Mrs. Hattie Platt of Sacramento county and Charles J. Richards of Placer county.

Dispatch: On the Alma the shaft is down 1000 feet and they are crosscutting to the ledge, making stopes, sump, etc.

The shaft at the Good Hope mine is now down over 100 feet and sinking is steadily progressing. They are going down on the ledge and are taking out quartz all the time.

Republican: At the Amador Queen No. 1 they are putting up more powerful hoisting gear. The shaft is down over 500 feet. It is the intention to go down to the depth of 1000 feet.

A rich strike occurred a few days ago in the Valparaiso mine at the head of Murphy's gulch. The strike was in the north extension of the old Mammoth mine, three miles south of Jackson.

J. F. Parks, superintendent of the Kendy, has been negotiating recently for the purpose of securing a bond for four years on the Good Hope mine. Seventy-five thousand dollars is to be the purchase price, if the company at the expiration of the term concludes to take the mine.

Butte.

Mercury: At the Diamond mine the shaft is sunk to the depth of 175 feet with good prospects. There is a force of eight men at work.

Register: At the Maack mine, in Morris ravine, the pay gravel it is reported will average $25 a day to the man. In order to work the mine to advantage the tunnels must be cut down lower and this will oblige the owners to put eight or ten men to work.

At the Mt. Ida mine the tunnel is now in 175 feet, the shaft was down 80 feet, and the drift from the bottom of the shaft is 60 feet. The rock looks well but owing to the stormy weather during February and early in this month the mill was closed and will not be run again for three or four weeks.

Calaveras.

At the South Paloma mine under the management of Mark B. Kerr, the shaft has reached a depth of 460 feet and a contract has been let to sink to 600 feet, when crosscuting will be made to the ledge.

At the Prussian Hill mine they have run a tunnel and tapped the ledge at about 170 feet from the surface. It shows about two feet in thickness, and the quartz is of very satisfactory appearance.

At the Gwinn the main work is being done on the 1300 and 1400-foot levels, and ore is being taken out fast enough to keep the 40-stamp mill running night and day. About 115 tons is crushed every day, and the owners are well satisfied with the results.

Citizen: At the San Andreas mine, adjoining the Ford, in charge of W. J. Provard, an incline shaft is being sunk and crosscutting east and west will be commenced when considerable depth has been reached.

Chronicle: At the Infernal mine the drain tunnel to tap the water in the mine has now reached a distance of 80 feet and the distance to be run is 250 feet.

The Luddy mine, about 1000 feet from the power plant on the bank of the Mokelumne river was located some six years ago by Mr. Luddy of San Andreas, and C. Kelton of Big Bar Bridge, who at that time ran a tunnel in on the ledge 125 feet and took out some good ore. The mine remained idle until last year when it was bonded to S. H. Lucas, who has been developing the property. They are now in good pay ore and have a ledge 8 feet wide.

Prospect: The Ford Mining Company, incorporated March 30, 1896, reports the following work done:

Shaft sunk since incorporation 260 feet; crosscuts and drifts run during the year on the 300-foot and 400-foot levels amount to a total of 769 feet. Summary of ore bodies: In old shaft about 60 feet in width of low-grade, highly mineralized ore; in new or north shaft, low-grade ore encountered in the shaft from 100 feet to 350 feet in depth. At 100-foot level high-grade ore was found in limited quantities. At 180-foot level exists an ore body 65 feet in width of the same general character as that in the old shaft. At 300-foot level two ore bodies exist, one 30 feet in width and the other 15 feet in width. In the 400-foot level small deposits of quartz and ore were cut near the shaft and an ore body of 20 feet in width was cut at a distance of 100 feet from the shaft. The ore in the 300 and 400-foot levels is of the same general character, carrying free gold and gold-bearing sulphurets. It may properly be termed a low-grade milling ore. Assays have been made of portions of these ore bodies by different assayers, with results ranging from $8.50 to $30.00 per ton.

El Dorado.

(Special Correspondence.)—M. T. Davis, dwelling near Mud Springs, last week turned up four handsome quartz specimens while following his plowshare. They are literally covered with gold on all sides.

Development work is contemplated on the Boneset property in the Jayhawk district, twelve miles west of Placerville. A tunnel was run on this property some years ago. It is now proposed to crosscut the ledge.

In the Big Sandy near Kelsey, a new ore body of good average size and quality was struck last week at 250 feet depth.

At the Pine Hill, nine miles west of town, they are crosscutting on the 200 level. They are drifting to the northwest and when the footwall is reached sinking will be resumed to an additional depth of 200 feet. The ledge matter is 92 feet between the greenstone wall and the dyke. A mill test for 68 feet down yielded $6 in free gold and from $75 to $250 in sulphurets. Steam power and compressed air for drills are in use. The shaft and drift work completed to date is 1352 feet. The property is 2000x6500 feet in area.

Chas. Neilly, et al., of San Francisco, have purchased the Perry ranch, 160 acres, in the vicinity of the Grand Victory mine, six miles southeast of Placerville. They will incorporate and begin extensive development work within a few months.

The Starlight, mine eight miles west of town, has struck a new ore body of good quality on the 250 level. This property is equipped with a new 10-stamp mill and a rope tramway. Steam power is in use.

Pennsylvania people are backing an enterprise in reopening the French Hill property and putting the 10-stamp mill in repair at Spanish Dry Diggings six miles north of Greenwood.

Placerville, March 23d, '97.

Mendocino.

The Red Mountain Mining Company has bonded its property, eight miles southeast of Ukiah, for $10,000.

Mariposa.

Gazette: Work on the Roma mine, on Bear creek, is progressing rapidly, with eight men at work. This is an old mine and was worked in early days on a large scale.

C. G. Rogers, superintendent of the King Solomon and the Last Rose of Summer mines, extensions of the Roma, has eight men at work sinking and drifting.

M. McDougal is opening up the North Star mine with six men sinking a shaft. They are down 60 feet and the vein is 4 feet in width and prospects well from wall to wall.

J. A. Schroeder, superintendent of the Schroeder mine, now owned by F. W. Keeney of San Francisco, has a crew of men at work piping and taking out rock for the new mill which is waiting to be transported to the mine as soon as the roads permit.

Mono.

Best & Smith, owners of the Molus mine, have taken out considerable ore. The property is situated near the old Piute mine across the Mono line in the White mountains.

Nevada.

Transcript: John McCarthy has sold his group of mines in Washington township. The sale includes a water right of 400 inches of water and a ditch eight miles long, and includes the ground and claims from the Honest Frank and El Capitan to Poorman's creek below the Spanish mine.

Epstein & Bandman, of San Francisco, have inspected the Pittsburg mine. They found the property in satisfactory shape. It is believed that a plan is on foot to resume regular operations at this once very productive mine which has for years been worked in a desultory sort of way.

Telegraph: At the Bullion mine the shaft is now down to a depth of 800 feet and they have commenced a drift in order to strike the ledge. The drift will be started from the 800 depth and it is expected that by running south about 30 feet the ledge will be encountered.

Placer.

Argus: J. H. McCloud, of Clipper Gap, has bonded his big lead mine at Rich Flat to Joel Smith for $20,000, the life of the bond being 18 months.

The managers of the Marguerite mine are raising a shaft from a drift to the surface. When this is completed they intend to sink to the depth of 1000 feet. Hoisting works will be erected.

Sentinel: The big tunnel at the Eureka Consolidated drift gravel mine, above Forest Hill, was in a distance of 1932 feet on the date of March 12. The rock is very soft, and gives evidence that the channel must be near at hand. An upraise will soon be made. The company owns 6½ miles of established channel on the divide that has so far produced over $30,000,000.

San Bernardino.

On the Columbia mine, in the Macedonia district, one shaft is down 75 feet and another 30 feet is being sunk, also a crosscut tunnel 140 feet long. This tunnel taps the ledge about 100 feet deep. Two hundred tons of second-class ore is on the dump and ten tons of first-class ore.

The Occidental, Golden West and Good Hope are showing good ore.

H. U. Mudge is developing a group of five claims in the 29 Palms district. A 10-stamp mill will probably be put in in the spring.

Times: The Rose mine is putting on a large force of men and is sinking from the 700-foot level. Their 10-stamp mill is running night and day, besides shipping considerable high-grade ore.

The old Jeff Davis mine in the Morongo district has been purchased by San Francisco capitalists, represented on the grounds by G. L. Brown and M. E. and W. Barclay, the latter being superintendent. They have put ten men at work. The deepest shaft is down 120 feet. They have also purchased the Old Woman spring and two or three claims from J. Doyle and expect to put in a mill at the spring at an early date. They have also bonded a group of mines ten miles from Victor to be worked by a company called the Lafayette Gold Company.

E. McFee has run a tunnel on a well-defined ledge in Blackhawk mountain, showing a fine ledge of a large body of medium-grade gold ore.

San Diego.

Union: Twenty men are at work on the Aurora mine at Alamo under the direction of F. M. Bradshaw, one of the owners. The Aurora, before a granite dike was encountered a few years ago, produced $400,000 for its owners, Russell & Rhodes of Los Angeles.

The new management at the old copper mine, four miles south of San Marcos, has sunk a shaft and got a new ledge which is not only richer in copper than the old one but bears considerable silver.

Shasta.

Searchlight: The Mountain Copper Company is rapidly increasing its smelting capacity, and in a few weeks the third smelter will be ready to charge. The second furnace has been receiving ore for some time, and the capacity of the ovens and surface kilns has been taxed to the utmost. The new surface kilns on the bluff opposite the smelter are now being charged; with these the output will be nearly trebled. The roasted or calcined ore will be carried to the smelters by means of a wire ropeway, now about completed, and a great saving will result over the old system of reloading into cars and hauling the ore to its final destination.

Holt & Gregg have a large force of men employed at their lime quarries, near Kennett, building several large kilns. The firm will burn 2600 barrels during the present year.

M. D. Butler of the Delta mine, on Dog creek, will develop a cinnabar property in Trinity county. The Delta mine has been bonded by E. Sanders et al., and pumping machinery is being put into the mine to develop to a greater depth.

Barner & Riebe and Richard Hetschel, owners of the Gambrinus mine, located near Whiskeytown, struck a foot vein of rich rock on that property last week. Another tunnel will be started to tap the ledge 100 feet lower.

Dale & Dawson, proprietors of the Star of Hope mine, on Clover creek, shipped a carload of ore to the Keswick smelter last week. Their property has paid for its own development up to date.

Considerable interest has been aroused on account of the finding of good placer ground on the McCloud and some of its tributaries. J. B. Campbell has a claim ten miles above Baird that has produced considerable value. Last week he found a $36 nugget, and, from appearances, he is working on an old channel. Quartz gold is also found in the gulches tributary to the McCloud.

Free Press: At the Princess hydraulic mine, near Horsetown, after an experimental run of seventeen days with one giant, a good clean-up was made, and it will now be a month before the next. The giants are running night and day. Eight men are now employed.

At Old Diggings, the Central mine, owned by Whitehouse & Bliss of New York, and under the management of Mr. Hart, is turning out to be an excellent property. A railroad or tramway has been built from the mine to the Sacramento river, where the ore will be dumped and transported across the river and taken to the smelter at Keswick.

Litsch & Panter are hauling rich ore from the Garfield mine, which is also put across the river by a ropeway.

The Spanish mine, owned by Joshua Henry, is being developed, as also the Reid mine, which is under the foremanship of William Sandry.

Sierra.

Enterprise: Forty feet were made last week in the north tunnel at the Extension, with the rock in the face still soft.

Siskiyou.

Reporter: On Scott Bar twenty men are employed on the Columbia mine.

News: The Deistlehorst dredger is operating day and night in the Klamath. One advantage of this kind of mining is the ability to run in all kinds of weather, or in high or low water. The results of the enterprise have heretofore been entirely satisfactory, and more machines will be put in during the coming summer.

Work at the Blue Gravel has been progressing steadily during the past week. They have drifted a distance of 32 feet from the shaft on bedrock, which is pitched 2 feet.

On Humbug the Bull Brothers are working their hydraulic claim with good success. Colstein & Thrasn are taking out ore from their quartz mine and doing development work.

There have been some important developments in quartz properties during the past week in the Salmon river and Quartz valley localities, and reports of two rich strikes have been received.

Trinity.

Free Press: The furnaces at the Altoona quicksilver mine at Cinnabar will soon close down for a short time pending the further development of the mine. In the lower level at a depth of 350 feet the ledge pitched off from the shaft. During the winter months the shaft was put down to 500 feet and a drift was run to crosscut the ledge at that depth. The ore body was struck and looked exceedingly well. The air in the drift was bad and work upon an upraise on the ledge from the drift to the lower level has been in progress for some time in hopes of improving the ventilation. The work is not yet completed and the furnaces will be closed until the work is done. The mine is very wet. A 12-inch stream of water flows continuously from the pumps. The property never looked more valuable than at present.

Operations at the Bloss & McCleary hydraulic mine are progressing favorably. The firm has recently been operating extensively on the Hoskins mine, which they have had under bond for some time. They have completed the 60-foot shaft to the bed-rock and last week began drifting from the bottom.

Tuolumne.

Democratic Banner: The Toledo mine, near Tuttletown, has been bonded by San Francisco parties.

A well-defined ore chute has been developed in the Butler mine, Big Oak Flat, and hoisting machinery is being erected.

The Monogram has been developed sufficiently to justify the erection of a 10-stamp mill, which will be done at once.

John James has sold the Two Brothers mine, at Groveland, to parties in San Francisco. They expect to start to work as soon as they can land the necessary machinery.

Union Democrat: At the Dutch the drift is still being carried along through the rich body of ore struck last week, but its true extent has not yet been proven. Work is also continuing on the 200 level.

The Table Mountain gravel mine is being worked at present with a small crew, which will be increased by the owners, J. Hoskin & Co., when summer opens. One hundred and fifty feet of the old tunnel has been cleaned up, from which point they are drifting both ways on a body of pay gravel of some 60 feet in width.

At the Santa Ysabel sinking has been resumed in shaft No. 3 from the 600 level. They have commenced upraising onto Mascot vein to get the ledge blocked out for crushing when the new mill is in running order. Millwrights have commenced work on the new 20-stamp mill, but progress is slow on account of lumber and material arriving slowly. The machinery has all been forwarded and is tied up at Oakdale.

The Alabama is confining operations to sinking the shaft another 100 feet. When the neceesary depth is reached working on a large scale will be commenced under Superintendent W. E. Nevills.

Independent: Dr. Redding has struck a very rich vein of ore on his Tarantula mine. The quartz is intermixed with dyke and the vein from which it is taken is undoubtedly the Toledo.

NEVADA.

Walker Lake *Bulletin*: At Silver Peak in the Chiatovich tunnel there has been struck a large body of good ore in the Mary ledge, which the tunnel taps at a depth of about 450 feet. This proves the permanency of the mines.

L. Leidy is still developing his mine and has some good ore.

Barnes and partners of Alida Valley are taking out rich ore for shipment when the roads open.

Vickery & Scott are running a tunnel to drain their mine and are nearly in to the ledge.

A Los Angeles company has purchased and located a large lot of placer ground near Little Log spring, at the head of Tule canyon, and intend to work as soon as the snow gets off.

A copper deposit has been discovered in Salene valley.

Dayton *Times*: The enlargements to the Douglass mill for the machines of the Peck plant are approaching completion.

The Davis leaching plant is completed with the exception of setting up the tanks, which are expected to arrive soon.

WASHINGTON.

Spokane *Chronicle*: A Cheney syndicate has acquired the First National, Anna V. and Ruby, seven miles from Chewelah. Men are doing development work.

IDAHO.

F. F. Church, superintendent of the Boise assay office, has completed the compilation of the figures of gold, silver and lead during the year 1896. These figures show a total of $11,751,845, an increase of $1,641,360 over 1895. The following is a summary of the production:

	1896.	*1895.*
Gold	$ 2,323,700	$ 2,594,666
Silver	6,474,765	5,214,498
Lead	2,953,380	2,301,321
Tstals	$11,751,845	$10,110,485

Owyhee county leads in the production of gold, while Shoshone county shows the largest production of silver and lead.

Near Pierce City the American Placer Mining Company will start three giants before long. This company finished a three-mile bedrock flume last fall at a cost of $25,000, by which they will be able to handle the gravel in the Oro Fino bottom for a distance of twelve miles, which has never been worked for lack of dump. The flume empties into the canyon down which the Oro Fino rushes to the Clearwater, descending 2000 feet in fifteen miles. A short run was made with one giant last fall before cold weather came, the clean-up showing $1.50 per yard. The company owns some 1500 acres that it is their intention to wash off eventually, with an average depth of two yards, but the amount of water for use is small.

The Montana mine, located in Custer county, has been sold to Spokane and New York parties for $40,000.

Near Ketchum the Florida Mountain Mining Company has discharged all its miners except half a dozen employed running the drift in the lower level. In consequence, the new

and well-equipped mill at Dewey has ceased to drop stamps. The ore was of such low grade that it has not been paying hauling and milling expenses. About seventy-five men have been laid off.

BRITISH COLUMBIA

The following annual statement of the Slocan Star mine for 1896 will give an idea of costs of working and other disadvantages in that direction overcome by the richness of the ore. It will be seen that the duty paid exceeds the cost of all machinery, flumes and other improvements.

RECEIPTS

Cash on hand January 1, 1896		$ 19,402 69
Sales of ore	$645,814 35	
Rents etc	1,091 93	
Sales of material and supplies	336 53	
Refund of overcharges	451 50	
Damage to flume	38 50	651,635.81
Total		$701,008 50

EXPENDITURES

Supplies	19,348 21	
General expenses	2,096 25	
Equipment	26,563 16	
Freight and treatment	181,359 12	
Duty	75,459 63	
Counsel fees, insurance, etc	3,121 10	$394,001.07
Purchase of mineral claims		300 00
Dividends		250,000 00
Cash on hand December 31, 1896		56,793.53
Total		$701,008.50

Receipts from sales of silver and lead year ending December 31, 1896—

584,301 16 ounces of silver	$393,302 10
Average price of silver per ounce, .6731	
8,946,398 pounds of lead	$252,512.25
Average price of lead per cwt., $2 82¼	
Total	$645,814.35

SHIPMENTS FOR 1896.

	Pounds.
Gross weight of ore reported from smelters	15,597,097
Less tare weight of sacks	164,160
Less tare moisture	222,133
Net weight of ore reported from smelters	15,210,774

Average assay of year's shipments 7,865.0774 net tons; silver, 80.875 ounces per ton; lead, 63.35 per cent; moisture, 1.11 per cent.

Total production of silver and lead—

Gross ounces of silver reported from smelters	615,053.75
Less smelter deductions, 5 per cent.	30,752.69
Net ounces of silver reported from smelters	584,301 06
Gross pounds of lead reported from smelters	9,940,442
Less smelter deductions, 10 per cent	994,044
Net pounds of lead reported from smelters	8,946,398

There has been expended during the life of the mine $71,376 in machinery, flumes and other improvements.

Spokane *Chronicle*: C. L. Hoffman has bought the Cultus mineral claim for $4000.

The Slocan Star will declare another dividend of $50,000 next month, making a total of $450,000 paid in dividends by this mine.

F. LeCasto has bonded the Slocan Chief No. 10 and the Kootenay Queen at Kaslo creek for $30,000, 10 per cent down.

The Mountain View on Granite mountain, near Silverton, has been bonded by New Denver parties to John McMartin for $20,000.

Webb and Hughes, owners of the Montezuma mine, on the south fork of Kaslo creek, are making final arrangements to build a 100-ton concentrator.

The ore now in the bottom of Le Roi's shaft, below the 500-foot level, and in the face of the new west drift on that level, is of a very high grade. That in the west drift assays higher in gold than any yet taken from the mine. Ten assays taken from the ore in the bottom of the shaft gave an average of $58.96 per ton, while five assays made from the face of the west drift gave an average of $136 per ton.

UTAH.

Tintic *Miner*: Centennial-Eureka mine made another ore strike during the last week, which, promises to guarantee the continuance of regular dividends. The new ore body is over 8 feet wide, and an average sample across the entire face shows values of 79 ounces silver $8 in gold.

The shipments for the week were as follows: From the Bullion-Beck mine, twenty-five carloads of ore; Bullion-Beck mill, ten carloads of concentrates; Eureka Hill mine and mill, five carloads of concentrates; Ajax, five carloads of ore; Mammoth mill, eight carloads of concentrates; Sioux mill, six carloads of concentrates; Buckeye, one carload of ore; Dragon iron mine, two carloads of ore daily; Noon's iron mine, one carload of ore daily.

Eureka *Democrat*: Work will be resumed on the Buda claim near the Buckeye at Silver City. The shaft is now down 62 feet, and an incline drift has been run for a distance of 106 feet.

The timbers have arrived for the Godiva shaft and foundation for the compressor, and are being put in place.

Mammoth *Record*: All but three of the workmen at the Sunbeam have been laid off. The flow of water which was encountered a few days ago will probably necessitate the putting in of a pumping plant if the company decides to continue active development.

Work has been suspended on the Primrose at Silver City, the shaft having been sunk to the depth of 200 feet.

Bingham *Bulletin*: The Nast group has passed from the control of the Bingham Copper Company, which was operating it under bond and lease, and reverted to the owners.

The Bingham Copper Company is placing an order for a hoist at the Starlus, which will be planted over the shaft at the tunnel level, which is now 170 feet in depth.

Tribune: Since January 1st the Ontario has shipped 165,066 fine ounces of silver, and the Daly 115,936. The figures represent the product up to and including March 10th.

The auriferous deposits of the extreme West Dip are to be put to a test and to that end Capt. J. R. De Lamar will put down a shaft to whatever depth may be necessary to accomplish it.

In the Sunshine the workings have reached a depth of about 1000 feet, the arsenical properties have almost entirely disappeared, and it is claimed that there is a better quality of ore in sight than has yet been encountered in the mine. All the while the mill hasbeen closed down experiments looking to an increased saving of values have been in progress.

The Sacramento will very likely begin the payment of dividends again in April.

T. M. Thomas, who is identified with the gilsonite deposits of the Uncompahgre reservation, says the intention is to begin work on the locations as soon as an order can be secured from the officials at Washington.

The Dalton & Lark is producing only such ore as is necessary to provide for expenses, and no effort will be made to increase the output until the matting plant is erected.

President W. H. Thomas has gone to Bingham to outline plans for the future development of the Niagara Company's property. At present the ground is being worked almost exclusively by lessees, the management having found that the most profitable method. That the low-grade gold ores of Bingham can be profitably mined was revealed first, perhaps, by the management of the Niagara. Col. Heffron, who was in charge at the time, ascertained that on the surface were ores running from $4 to $7 per ton, and to the end that they might be handled, experiments were begun. Before the expiration of the season it was demonstrated that the gold ores could be treated at a fair profit.

SOUTH DAKOTA.

Black Hills *Times*: A. B. Wells of Fort Meade has closed a deal on the Canada group of twenty-two claims, lying north of the Highland group on Iron creek.

Hartzell, Hennelley, Murphy & Rankins, the owners of a group in the Ragged Top country, have disposed of ten claims in the Foutz group to Mason, Stewart and other Elkhorn railroad officials for $10,000.

Development work on the Snowstorm property in Nevada gulch has been suspended, but will be resumed by the first of May. The Eastern parties represented by Merrill & Allen have sunk a shaft 360 feet to quartzite and driven tunnels aggregating 425 feet, without finding ore that would justify handling. They have expended about $30,000.

Kilpatrick Bros. & Dacey are working double shifts in the shaft on the Flora E., on Ragged Top, which is now about 280 feet in depth. The company has contemplated for some time putting in a new hoisting plant over the Dacey shaft, though the matter has not as yet been decided upon.

The new hydraulic company at Hayward will put a dam across Battle creek and put in an extensive pumping plant which will lift the water to the divide between Battle creek and Rosebud, where the reservoir will give a sufficient head of water for hydraulic purposes.

The Union Hill Company's last shipment of ore from the Richmond-Sitting Bull property gave returns of 107 ounces silver, 16 per cent lead and $20 gold per ton. A large force of men are employed and there is more ore and of better grade in sight than at any time since the mine was first opened. A fine grade of iron fluxing ore is being mined from the Custer lode, one of the Richmond group of claims. The company are also taking out a good grade of ore from the Black Prince group. At the Branch Mint lode the vein of ore is steadily increasing in size. The diamond drill on Union Hill proper has reached a depth of 620 feet. The core brought up shows the ore body to be continuous and of average grade. Assays show values ranging from $7.32 to $33 gold per ton. The ore is a free milling proposition, and with the big mill and automatic appliances to be put up this season by the company the cost of milling and mining this ore will not exceed $1 per ton.

A discovery of siliceous ore identical with that from Ragged Top has been made in the limestone range southwest of Custer peak by W. M. Merritt. The ore is found in the limestone, following a porphyry contact, and exists in vertical and horizontal veins that are easily traced for a distance of 6000 feet.

WYOMING.

An option has been given to New York capitalists by the owners of the group of iron mines at Hartsville, from which shipments of iron ore have been made for the past two months to Denver smelters. The price to be paid for the claims is $25,000.

MONTANA.

Inter-Mountain: There will be no cessation of work by the Parrot Company at the new plant at Gaylord. It has already cost in the neighborhood of half a million dollars and it is expected to be in running order by July or August at the latest. The Parrot people have decided to discontinue operations at the Hesperus and a force of men has been engaged in hoisting the pumps and removing the machinery.

A few months ago the Parrot company bonded the Hesperus and Red Chief lodes for $260,000 and began work on the shaft in the former claim, which was developed to a depth of 250 feet. Several stringers of copper ore were struck while sinking, but no ore bodies.

At the Mohegan gold mine at Red Bluff the new 10-stamp mill is in operation, with enough ore in sight to run 12 months.

Butte *Miner*: The great tunnel which was constructed at the cost of $250,000 taps both the Bimetallic and the Granite Mountain, the former at the 1000-foot level and the latter at the 1300. The tunnel drains both mines and will save a large amount of money each month which in the past had to be spent for pumping. At the mill every device for the cheap handling of low-grade ores and the utilization of power will be in use, and it is estimated that there are about 100,000 tons of low-grade ore on the Bimetallic and Granite dumps which will be put through this mill.

The Butte and Boston Mining Company are getting ready to start the Blue Jay. The shaft is down 650 feet, and there is a good body of ore on the bottom, but the ground is mostly worked about this level.

The Emery mine in Deer Lodge county has just been leased for another year. From September 1, 1895, to January 1, 1897, (15 months) the total output of this mine was $119,191; and during that period the royalty paid to the owners of the mine amounted to $27,682.

The Montana Ore Purchasing Company has been given an option on the Nipper mining claim, the bond being for $132,000. During the past year a shaft 250 feet deep has been sunk on the claim, which borders on the Anaconda mine.

Cobban and Rickards, of Butte, have a lease on the Moon ranch, Missoula, and are prospecting for coal. They will either sink a regular working shaft to a depth of 150 feet, or drive the diamond drill into the ground 1000 feet.

The Excelsior mine, Bannack, is employing 50 men. It is estimated that 250 more will have work in the placer and quartz mines in that vicinity next summer.

The Bannack Gold Dredging Company will work the Bon Accord placer ground. Another dredge is being built by this company with a capacity 50 per cent greater than the old one.

Madisonian: The capacity of the plant on German bar for working gravel will be about 800 cubic yards for the shift. From the tower, to which the gravel will be elevated by means of a large scraper-car traveling on a cable, it will work in all directions for a radius of 300 feet, or about four acres. Then the tower will be moved on rollers and slides by means of a powerful engine—a necessary part of the plant. The car will carry about two tons of gravel each trip, and will make trips in a trifle over one minute. It dumps automatically into the high tower; the gold is separated from the gravel by ordinary sluicing methods.

COLORADO.

CRIPPLE CREEK.

(Special Correspondence.)—The district is now producing about 700 tons of ore per day, which, it is estimated, averages about two and a half ounces in gold to the ton.

A recent shipment by the Prince Albert, on Beacon hill, ran $6,200 to the ton. A later shipment ran $700 to the ton.

The Anchoria Leland, for February, shipped 600 tons of ore, which ran about $60 per ton. Two hundred tons besides this went to the chlorination works and ran $20 to $25 per ton.

The Moon-Anchor, on Gold, is opening a 500-foot level to cut an ore chute 20 to 30 feet north of shaft. The latter is down 500 feet. The 400-foot level is now producing.

The Geyser mill has put in an electrochemical process, which the owners believe will fill the requirements for a certain character of ore.

The Gold Coin is shipping about fifty tons per day—three-fourths of it going to the cyanide works at Florence. Gold Coin ores run from $30 to $40 per ton.

Control in the Ashmont was sold to Richardson, Hill & Co., of Boston, for $50,000. The property is on Raven hill.

The Gold Hill tunnel has been driven to a point within 200 feet of the Moon-Anchor vein, which, it is claimed, it will cut at a depth of 320 feet. It will also cut the Anchoria-Leland workings at 650 feet. It is designed to be a drainage and transportation tunnel and the promoters are working in harmony with the surface claimants.

The Alice mine, on Gold hill, has put in a new air compressor and are driving in on the vein. This property is owned by Geo. A. Joslyn and D. V. Sholes of Omaha.

The St. Thomas, on Beacon, owned by the Contract Gold Mining Company, is being developed by a shaft and drifts therefrom. This is only one of a long line of new properties on Beacon, all of which have encountered good indications near the surface. The Lindsay lease is understood to have developed ore worth $65 per ton at 50 feet. The Lanterman property, next to it, is in a fair way to become a producing mine.

The Mutual Benefit Mining and Leasing Company, operating the Chicago and Cripple Creek tunnel on Globe hill, is shipping ore of the value of two and a half ounces per ton from drifts and slopes off the tunnel.

WASCOTT.

Denver *Republican*: At Cripple Creek an option on the Lindsay lease and bond on block 22 of the Arequa townsite has been purchased by Dennis Sullivan of Denver. The price to be paid is in the neighborhood of $50,000 above the bond of the same amount running from the Mabel M. Company.

New York parties have purchased of Ben Brewer the Philadelphia claim, located south of the town of Cripple Creek. The ground is to go into a stock company soon to be organized with a group of claims on Republican mountain.

A station for the fourth level is being cut in the Arcadia shaft at 275 feet. Production is from fifty to sixty tons a month.

Sinking the Independence shaft has been suspended near the point for the 900-foot station. The water flow increased with such force that it was found advisible to stop the shaft until further exploration could be done in the seventh level. The mine is yielding about its usual 1000 tons of smelting ore a month.

The Anaconda is shipping its usual amount of mill ore, from thirty to forty tons daily, or, approximately, 1000 tons a month.

At Telluride, the resumption of work on the Canton illustrates to some extent how gradually gold propositions in San Miguel county, considered unprofitable to work a few years ago, when almost every person's attention was given to mining for silver, are coming into prominence and being leased, bonded and developed.

The Occidental, in the immediate vicinity of the Japan, Tomboy and other well known properties, Savage basin, was recently leased and bonded to George Blackwell and Nate Fields for an agreed price of $35,000.

Near Central City, the output during the past month of the Kansas, Hidden Treasure and Indiana mines, in Nevadaville, operated by the Gold Coin Mines Company, reached a total of $25,000. This same company has also entered into a contract with the California Mining and Milling Company, an English corporation, owning the California group of twelve patented claims on Quartz hill, to purchase the property.

The Old Kentucky Mining Company of Gilpin county has let a contract to sink the main shaft 300 feet below the 400-foot level. A number of ore bodies have been passed through in sinking the shaft, but no shipments of moment will be made until the mine is thoroughly developed.

During the coming season a 100-ton plant for the reduction of low-grade ores will be erected at some point in the San Juan region. A specialty will be made of $12 to $20 ore.

NEW MEXICO.

Silver City *Enterprise*: At Central the new cable for the hoist at the Texas mine has been put on the spool and all preparations made to resume sinking the shaft. The 300 level will be reached and drifts started next week.

The bond on the Lost mine group expires on April 2nd, and from the expressions of the expert sent to examine the property, it is expected the deal will be closed and the new owners will commence active operations immediately.

At Pinos the four mining experts who spent ten days examining the Bell & Stevens properties have gone to San Francisco.

At Copper Hat the new smelter is working successfully and is running full time except Sundays. Work is progressing rapidly in the mines with favorable developments. The company has also started work upon the "Anson S" mine, between Copper Flat and Hanover.

At Mogollon the Confidence mine is producing about 100 tons of ore per day, more than sufficient to supply the 30-stamp mill, belonging to the company, on Whitewater.

ARIZONA.

Phœnix *Republican*: An Eastern syndicate, headed by J. B. Greenhub of Peoria, Illinois, has purchased the property of the Santa Maria Mining Company—six claims on the Santa Maria owned by C. D. Clark and J. C. Rankin of Phœnix. Clark and Rankin bought these mines two years ago, erected a mill and have uncovered large ore bodies. The new company will at once put up more stamps, put in a cyanide plant and work the mines on an extensive scale.

C. L. Hall, of the Mammoth mine at Goldfield, has bonded the Bull Dog mine, and active work will be commenced at once on the mine.

News comes from Oro Blanco that a 12-foot vein of high-grade gold ore has been struck in the mine formerly owned by Hart and associates. The body of ore seems permanent.

Tucson *Star*: The DuQuesne Mining & Reduction Company have bought a 100 H. P. boiler and a 50 H. P. hoist for their mines.

The Ora mine, under the supervision of Mr. Gould, is taking out $1000 a day, besides their concentrates and battery clingings.

The Baxter mines have sent in a large shipment of high-grade copper ore to the smelter, which averages 27 per cent.

Prescott *Journal-Miner*: The Providence Mining Company has struck 2 feet of ore below the 200-foot level which assays high. Their new 10-stamp mill is now running with satisfactory results.

What has been known as the Mexican mine on the lower Hassayampa and from which such fabulously rich ore has been taken at intervals, is again to the front in the production of two large gold nuggets. One of them was of the value of $320 and the other about $90.

MEXICO.

Lower Californian: The San Juan mines, just below the twenty-eighth parallel, in which work was temporarily suspended for a time, are now operated by Messrs. Schramm & Moraga to their full capacity. About 150 men are employed at the mine, and nearly the same number in the reduction works, which are about seven miles distant from the mine and connected by a railroad. The San Juan mines have been operated for the past twelve years. The main shaft is down 1000 feet, with extensive drifts and crosscuts. The ore carries both gold and silver. Of the latter the average is 40 ounces per ton; of the former from $8 to $10. These mines were formerly owned by the Cranz Bros. of San Jose, Cal., who developed the property to its present importance. At San Francisquito the Lacy Bros. of Los Angeles are pushing development work on what is known as the Bareno mines which they recently purchased. They have a large force of men at work, have sunk the shaft to a depth of 95 feet, and have tunneled 100 feet or more. Their machinery, including a mill of twenty tons daily capacity, dynamo for electric lighting, etc., is now on the ground.

The Ibarra Mining Company at Calmalli are opening some extensive bodies of ore, much of which is very high grade, and work will probably soon be resumed on a larger scale than ever.

It is reported that miners are again in demand in the Alamo. Several of the mines in that district are increasing their forces, and a large number of men have left Ensenada during the past week to find work there.

F. M. Bradshaw of the Aurora mine writes that they are hoisting some good rock and are working twenty men.

Coast Industreal Notes.

—The corner stone of the new affiliated colleges in San Francisco will be laid this afternoon.

—Nevada City, Cal., trustees have offered Mrs. Huntington $25,000 for the N. C. waterworks. She asks $28,000.

California dry wines are now selling at 20 cents a gallon. Three years ago the same kinds of wine sold at six cents.

—The contract for the construction of the Valley Road branch from Fresno to Visalia, Cal., has been signed and work begun.

—A San Jose, Cal., brick company has the contract to furnish 3,000,000 bricks for the Spreckels sugar refinery at Salinas, Cal.

—San Miguel, the westernmost of the Santa Barbara channel islands, is to be a big hog ranch run by F. K. Rule. The island comprizes 14,000 acres.

—The Astoria Iron Works of Astoria, Or., has been awarded the contract for repairing the lighthouse tender Manzanita. They will receive $18,800 for the work.

—At San Jose, Cal., the tunnel on the extension of the motor railway into Alum Rock park will be finished in about ten days, and trains will then begin running to the bathhouses.

—Point Richmond has been bought by the San Joaquin Valley Railroad and will be its tidewater terminus. It is the intention to make it a rival to Port Costa in the wheat shipping business.

—At Los Angeles, Cal., the Merchants' and Manufacturers Association has undertaken the construction of a boulevard to run between Los Angeles and Pasadena, ten miles in length and 140 feet wide to cost $300,000.

—Operating officials of the Santa Fe road have decided that the bulk of the 55,000 tons of steel rails recently purchased by that company shall be used in relaying portions of the tracks between Chicago and Kansas City.

—The largest importation of Turkish leaf tobacco ever received at San Francisco, consigned to a prominent firm, will be used in the manufacture of cigarettes. It weighed 7182 pounds and is said to have cost $7000 in Constantinople.

—Last Saturday a tariff on shingles of 62½ cents and lumber 60 cents became effective on mixed cars from Portland, Seattle and Tacoma to Kansas City, Mo., Leavenworth and points in Kansas on the Northern Pacific railroad system.

—At Tacoma, Wash., the Northern Pacific Railway Company will begin work soon on the construction of a seawall of solid stone masonry between its ocean docks and coal bunkers, a distance of 1200 feet. The wall will run from 15 to 40 feet in height.

—The Santa Fe Railroad Company will do considerable repair work this season. Nearly 200 miles of new steel track will be laid between Albuquerque and Barstow at a cost of $800,000. One hundred and fifty miles more of the track will be ballasted with volcanic cinders.

—A new survey of the Pacific, particularly with a view of seeing where the ocean trough east of Japan may best be crossed by a cable, is to be called for at this time. The work will be of scientific value and is a contribution that ought to be made to the Pacific cable project.

—The Great Northern Railway has an arrangement which gives it the option of the Columbia river route to Portland and thence by steamer or taking the longer haul to Seattle and thence by steamer either way, in connection with the Pacific Coast Steamship Company. The Northern Pacific is not in any way connected with the new instructions.

—San Francisco lumbermen are trying to organize a trust to raise the price of lumber from $4 to $5 per M. They claim that the actual cost of milling the lumber is greater than the present prices. The former combination of lumber mills collapsed last year by several mills outside the combination offering lumber at prices lower than those outside of the trust.

—The Corral Hollow, Cal., coal mines are now in practical operation. A large plant, previously described herein, has been put in at the mines, thirty-six miles from Stockton. The coal veins give evidence of continuity, and it is thought the quantity is to be estimated by the million tons. The Pacific Transmission Co. proposes to erect works at the mines to use the screenings and waste in generating electric power and light for Oakland.

—The Oregon Short Line, now an independent line, includes the following branches: Frisco, Utah, to Silver Bow, Mont.; Granger, Wyo., to Huntington, Or.; Shoshone, Idaho, to Ketchum, Idaho; Cache Junction, Utah, to Preston, Idaho; Syracuse Junction, Utah, to Syracuse, Utah; Salt Lake to Terminus, Utah; Lehi Junction, Utah, to Ironton, with branches to Eureka, Monmouth, Tintic, Silver City and Northern Spy mine, Utah. It is unlikely that there will be any unity of action between the Union Pacific and the Oregon Short Line. After May 1 no annual passes of Union Pacific issue will be accepted by the Oregon Short Line.

—The Southern California Power Company, capitalized at $1,000,000, proposes to develop the water power of the Santa Ana river by taking water out at the junction of Bear creek with the river and carrying it in a ditch and pipe line to the head of the present Bear valley canal, there to be delivered to water wheels at 1100 feet head, generating 10,000 H. P. The electric plant in the power house will deliver the current to wires for transmission to Los Angeles, seventy-five miles. The power to be sold to various electric street railway and lighting companies now using steam as a motive power in that city. The *Times* says this can be done at a price which will supplant every stationary steam plant in Los Angeles.

Personal.

T. A. RICKARD has been deservedly re-appointed State Geologist of Colorado.

J. Q. MCDONALD, of Denver, is now managing the Brodie mill at Cripple Creek.

O. H. PACKER, a mining engineer of Junction, Nevada, is about to remove to San Francisco.

W. FRANK DRAKE of Sonora, Cal., has been appointed superintendent of the Reliance Gold Mining Co.

W. S. STRATTON of Cripple Creek has been in Utah the past week looking at some of the mining camps.

P. A. SNELL has been appointed superintendent of the Cactus Mining Company's mines and mill at Frisco, Utah.

BINGER HERMANN of Oregon has been appointed by President McKinley as Commissioner of the General Land Office. The office will now be filled by an honest and competent man.

H. C. HOOVER, M. E., graduate of Leland Stanford Jr. University, and for some time connected with the United States Geological Survey, has accepted an engagement in Western Australia, and left last Wednesday for London, from whence he will go direct to Australia. His work will be to examine some large mineral fields controlled by a London syndicate. Mr. Hoover has for some time been an assistant to Louis Janin, at whose recommendation he obtained the place. His salary is understood to be $5000 a year.

Recently Declared Mining Dividends.

Mercur, Utah, $25,000; payable March 20th.

Bullion-Beck, Utah, $50,000; payable March 20th.

Standard Con. Mining Company of Bodie, Cal., $20,000: March 23.

Western Mine Enterprise Company, Butte, Montana; payable March 19.

Goodenough, Slocan, British Columbia, $24,000, payable March 16.

Napa Con. Q. M. Co., Cal., 10c per share, $10,000; payable April 1.

Slocan Star, British Columbia, $50,000; payable March 25. This is a total of $350,000 paid since August, 1895.

Homestake, South Dakota, $81,250; payable March 25th; a total this year of $93,750, and since opening, $6,181,250.

Recent California Mining Incorporations.

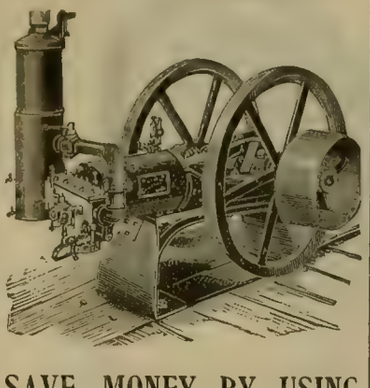
Arrastraville Mining Company, S. F.; capital stock, $250,000—$14 subscribed. L. E. Lake, J. W. Harrison, R. B. Hogue, G. L. Norte, R. Rising, F. H. McCormick, J. Metcalf.

Excelsior M. Co., San Francisco; capital stock, $10,000,000—$50,000 subscribed. G. Niebaum, L. Sloss, L. Gerstle, W. L. Gerstle, all of San Francisco.

Yellow Jacket G. M. Co., Plumas, Cal.; principal place of business, San Jose; capital stock, $500,000—$170,000 subscribed. G. Roberts, W. M. Cooper, C. Doerr, I. E. Brigdon, San Jose; R. Fisk, Edenvale; J. M. Haskins, F. J. Smith, Evergreen.

Alaska Empire Mining Co. and Delaroff Mining Co., S. F.; each company has capital stock of $10,000,000; $50,000 subscribed; G. Niebaum, L. Sloss, W. L. Gerstle.

California G. M. Co., San Francisco; capital stock, $800,000—$5 subscribed. T. J. Huteson, Central City, Nebr.; C. H. Maass, F. H. Ames, J. McNab, J. Long, San Francisco.



Sierra Mining and Development Co., Fresno; capital stock, $100,000—subscribed, $1000. E. C. Dunn, W. A. Washer, W. N. Rohrer, T. F. Forsey, Fresno; A. N. Dick, Woodland.

Book Notices.

The Practical Management of Engines and Boilers: This is a valuable treatise for engineers and firemen on boiler setting, pumps, injectors, feedwater heaters, steam engine economy, condensers, indicators, slide valves, safety valves, governors, steam gauges, incrustation and corrosion, etc., by William Barnet Le Van, consulting steam engineer and member of the American Society of Mechanical Engineers and of the Franklin Institute. It is illustrated by forty-nine valuable engravings. Pub ished by Philadelphia Book Co., 19 South Ninth St. Price, $2.

Cripple Creek—Its History to Date, Illustrated.
Just out, with correct map and costly full page views natural as life. This great book will be sent free prepaid with our big 56-col. family paper 3 months on trial for 25c (stamps or silver); club of 5, $1. Latest mining news. Mention The Press and address *Illustrated Weekly Sentinel*. Denver, Colo.

Cheap Power!

SAVE MONEY BY USING

—THE—

"DANIEL BEST"

Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget th s when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav.,	7½ galls.	at	5c.,	$.37½
Distillate	40 "	7½ "	8c.,	.60
Domestic Coal Oil	40 "	7½ "	12½c.,	.93¾
Gasoline	74 "	8¾ "	15c.,	1.31¼
City Gas	1000 feet,			2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebel ious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Pluta, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado, send to

Assaying Gold

.....AND.....

Silver Ores.

A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores.") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 128 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

British Columbia.

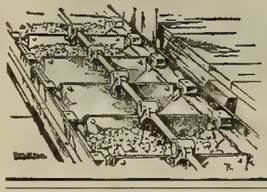
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.



KENDALL GOLD AND SILVER EXTRACTION CO.

THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

FRASER & CHALMERS,

Chicago, Illinois,

Have brought out a new line of medium size

Steam Hoisting Engines,

These are designed with great care by engineers familiar with the best previous practice, and knowing just what is wanted to render satisfactory service on a mine. Do you want such service? Then buy one of these improved machines.

Other Special Lines of Manufacture

On which we would be glad to quote are

Stamp Mills, Shoes,
Smelting Furnaces, Dies,
Cyanide Plant, Cams,
Ore Crushers, Rolls,
Frue Vanner Concentrators, Jigs,
Brown Roasting Furnaces,
Huntington Mills,
Perforated Metals and Screens,
Corliss Engines,
Adams Boilers,
Riedler Air Compressors & Pumps,
Otto Aerial Tramways.

Qualified by a Quarter Century of Experience to render you the best of service, we invite your inquiries and patronage.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY RAIL JOINT.—Leonard W. Kennedy, Oakland, Cal., assignor one-half to Philip G. Galpin, Berkeley, Cal. No. 578,882. Dated March 16, 1897. This invention relates to improvements in joints for the meeting ends of railway rails, and a means for uniting and supporting them. The object is to bridge the space necessarily left between the ends of rails to accommodate the expansion and contraction, and to provide a means for connecting and supporting the meeting ends of railway rails so as to form a continuous line of travel upon which the flanges of the wheels pass over the joints to prevent bruising and battering the latter. It consists essentially of a plate adapted to fit the form of the side of the rail having a dovetailed head or extension fitting into a corresponding recess made in the rail head, this head and recess forming a lock to hold the sections of the rail together and prevent any lateral shifting of the joint.

COMPOSITE BARREL.—O. W. Crawford, San Francisco, Cal. No. 578,974. Dated March 16, 1897. This invention relates to improvements in the construction of barrels, and it consists in so forming the outer longitudinal staves and the inner metal lining as to make a homogeneous composite package in which the metal interior and the outer cylinder are formed of longitudinal staves, and surrounding hoops are rolled into form, simultaneously forming a composite suructure having interior hoops at the ends to receive the heads which fit therein.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & CO., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1896.

BRADLEY PULVERIZER CO. *Gentlemen*:—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker, and they average about 20 tons to each machine, 40 mesh fine, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills.** We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisbie Lucop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

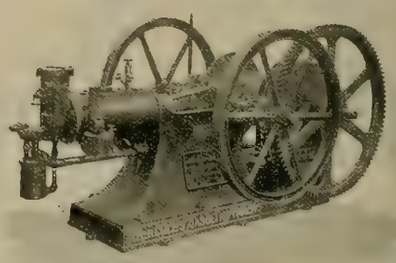
Yours truly, (Signed) J. R. DELAMAR.

HOW 10 GRIFFIN MILLS WORK.

DELAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

BRADLEY PULVERIZER CO. *Gentlemen*:—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager*.



These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.

HERCULES GAS, GASOLINE AND DISTILLATE ENGINES.

HOISTING ENGINES, 2 h. p. to 200 h. p. ✦ **STATIONARY ENGINES,** 1 h. p. to 200 h. p. ✦ **MARINE ENGINES,** 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ½ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.

NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

MINING AND SCIENTIFIC PRESS,
220 Market Street..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth, 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners
By C. W. Moore. With numerous Illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.

The Mine and Smelter Supply Co.,

. . . DENVER, COLORADO, . . .

ARE SOLE AGENTS FOR THE

Wilfley Concentrating Table,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Anyone can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.

ROMLEY, COLO., Jan. 19, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Answering yours of the 5th inst., would state that after a thorough trial we have discarded seven Woodbury Tables and two Johnsons and adopted the Wilfley Concentrating Table, which we think up to date is the best table in the market, so far as our knowledge is concerned. Yours very truly, [SIGNED] B. B. MORLEY, M'g'r Golf M. & M. Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

IF YOU HAVE A SMELTER--YOU WANT IT.
IF YOU HAVE A COPPER MINE--YOU NEED IT.
IF YOU HAVE A CYANIDE PLANT--YOU OUGHT TO HAVE IT.
IF YOU OWN CHLORINATION WORKS--YOU SHOULD BUY IT.
IF YOU ARE INTERESTED IN A MINE OR MILL--YOU CAN'T DO WITHOUT IT.

What? P. & B. Paint.

IT IS ABSOLUTELY ACID PROOF---TRIED AND PROVEN.

Manufactured by

PARAFFINE PAINT CO., San Francisco. Los Angeles.

You Can Order It From Your Dealer.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

Market Reports.

The Markets.

SAN FRANCISCO, March 25, 1897.

Business continues to revive, but, as yet, slowly. It has been years since there was such a feeling of confidence with the trade and manufacturers. There are few, if any, pessimists, for they have turned optimists. The general trend of values is toward higher prices, which, in itself, is calculated to promote a better feeling. This is in strong contrast with the past few years, for the trend was downward. Tariff talk and uncertainty how the Dingley bill will finally become law, have an unsettled influence on market values on the coast and in the East. This uncertainty also prevents stocking up, except in a few lines, as freely as the trade would if a positive assurance were had regarding the outcome. Several local manufacturers are beginning to run longer time and full-handed. Iron workers in general report increased bids on new work, but owing to close competition low figures have to be named.

The local money market continues to work on easy lines notwithstanding continued remitting to the East. Owing to a small supply of bills in the East, New York exchange is strong at an advance. The money sent to that city is imports from Australia and also by importers here who are withdrawing goods from bond which come from Europe via the East. It is reported in mining circles that considerable money is coming from Europe to this country for investment in mining properties and that more attention will be given to the mines in this State than heretofore. This, it is said, is due to good results secured from former investment. If swindlers and would-be so-called mining experts do not foist poor and worthless properties on buyers we can look for a larger boom in mining in 1898 than will be witnessed this year. The Eastern money markets are reported easy although under an increasing demand for funds the rates of discount begin to strenghten. The improved call comes from manufacturers and also importers of foreign goods. There is a growing impression at the East that gold exporting is owing to the increasing premium on the yellow metal at European money centers. This higher premium has been brought about by the heavy buying of both Russia and Japan.

New York Silver Prices.

NEW YORK, March 25.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	28⅝	62⅜
Saturday	28 11-16	62½
Monday	28 15-16	63
Tuesday	28 11-16	63
Wednesday	28¾	62⅝
Thursday	28 13-16	62¾

	Copper.	Lead.	Iron.	Tin.
Friday	11 85@12 00	3 45	10 00@12 50	13 30
Saturday	11 85@12 00	3 45	10 00@12 50	13 32½
Monday	11 85@12 00	3 45	10 00@12 50	13 37½
Tuesday	11 85@12 00	3 45	10 00@12 50	13 40
Wednesday	11 85@12 00	3 45	10 00@12 50	13 30
Thursday	11 85@12 00	3 45	10 00@12 50	13 35

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	.17½c Prem
New York Telegraphic Transfer	.20c Prem
London Bankers' 60 days	$4.86½
London Merchants	$4.85
London Sight Bankers	$4.89
Refined Silver, per oz., 1000 fine	62¼
Mexican Dollars	49½@50

SILVER.—The market at London advanced to 28 11-16d and the New York market to 63 cents but when the former rose to 28⅝d the latter set back to 62⅝ cents. The advance was due to reports that Japan would not throw her holdings on the market, but what caused the decline we are not advised, but it was probably due to realizing sales. The demand in Europe is said to be slow which has an unfavorable effect for with any selling pressure lower prices would have to be accepted by holders.

MEXICAN DOLLARS.—There is a fair demand at current quotations. The unsettled feverish market for silver bullion is not calculated to promote buying of Mexicans beyond immediate requirements.

QUICKSILVER.—The market has held to steady prices, with a stronger tone as the odds and ends are placed. London and New York advices state that as the markets clean-up of outside holdings values advance to the syndicate's figures. There was exported the past week 320 flasks to Central America and Mexico.

Our market is quoted at $40 for domestic consumption.

COPPER.—Our market is practically unchanged, but Eastern advices state there is an easier tone on the Atlantic seaboard, with Europe bidding lower. For round lots of Lake Superior 11¾ was bid. The dullness in the markets at the East and abroad, with an entire absence of any speculative movement, are against sellers. The increased production in this country and large consumers abroad being supplied for a few weeks ahead are the prime factors in causing weak markets.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	—@13½
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

LEAD.—There is a continued free consumption in this country, which, with strong holding, keeps the market up. Europe sends advices of strong markets.

Mr. C. Kirchoff, Special Agent for the United States Geological Survey, in his statement for March 15th, estimates as follows:

	*Tons.
Production of domestic lead for 1896	166,964
Home consumption for 1896	185,589

* Tons of 2240 lbs.

The figures of the Metal Exchange, published in their *Annual Review*, January 9th, were:

	*Tons.
Domestic production	160,000
Home consumption	187,470

* Tons of 2240 lbs.

Our market is quoted in jobbing lots as follows:

Pig	4 00	@	4 25
Bar	—	@	4 50
Sheet	5 62½	@	6 12½
Pipe	4 87½	@	5 37½

SHOT.—The market is firmer at last week's advance.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 35
Drop, B and larger sizes,	"	"	1 60
Buck, Balls and Chilled, do,	"	"	1 60

TIN—Our market is steady for both pig and plate. Heavy imports of plate are being made of both foreign and American for canners' use. The consumption promises to be larger this year. The East reports a barely steady market for pig and continued cutting in plate.

We quote as follows in a jobbing way:

Pig, per lb		14½c@	—
Plate, I C coke, heavy, per box		$4 05@	4 15
" " light, "		3 95@	—

BORAX.—Market prices and demand are practically unchanged.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5¼
Powdered, in car lots	5
Concentrated, "	4½

POWDER—The market is firm with a good demand ruling.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—The market is fairly steady on this coast. The proposed increased duty on foreign has somewhat of an unsettling influence. At the East the markets are easy with a tendency to lower figures owing to strong selling competition. Exports are increasing.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The market is firm for all varieties on spot and nearby arrivals, but for distant shipments the feeling is easy, yet sellers will not name lower figures. It is stated that the consumption of steam on this coast will show a very large increase this year.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00	@	—
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00
Gilman	5 50	@	6 00
Seattle	5 50	@	6 00
Coos Bay	—	@	4 75
Cannel	8 00	@	—
Egg, hard	12 00	@	13 00
Wallsend	6 50	@	—

TO ARRIVE—CARGO LOTS.

Australian	5 50		
Liverpool Steam	6 25		
Scotch Splint	—		
Cardiff	6 25		
Lehigh Lump	9 00		
Cumberland	13 00		
Egg, hard	10 00		
West Hartley	6 50		

COKE.—The market is quoted as follows:

Gas Companies'	—		—
English, to load	9 50	@	—
" spot, in bulk	10 00	@	—
" in sacks	11 00	@	12 00
Cumberland	—	@	—

ANTIMONY.—The market is steady.

Our market is quoted at 7⅛@8¼c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6⅞@7c for Hallett's and 6⅞@7c for Japanese.

NAILS—The demand is free and market strong.

Wire, carloads, basis per keg			
" jobbing, " "			$2 25
Cut, carloads, " "			
" jobbing, " "			2 10

SPELTER.—The market is steady, with a fair inquiry reported. The East reports active markets.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The markets here and at the East are steady.

PLATINUM.—Dealers report a fair inquiry.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is steady at quotations.

Our market is quoted at 10 to 15 cents, according to thickness.

Pending tariff legislation unsettles the market somewhat. The general feeling is that prices will advance on several lines.

BONEASH.—There is a good export movement, chiefly to Australasia.

ALUMINUM.—The market is steady. We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—There is a fair inquiry for the season.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is steady to firm.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

The tariff question is having its effect on the market. The general feeling is that better prices will rule following the passing of the bill. With improving trade the call for chemicals shows an increase.

BONEASH.—The market is firm with a good demand reported.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is reported steady and firm at 2½c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but firm at $1.70 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a better demand at 2¼c a pound from stores.

NITRATE OF SODA.—Advices from primary markets are to the effect that prices are slightly higher.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firmer from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is fair. We quote in a jobbing way at 1¾c per lb for 66%.

BLUE VITRIOL.—The Eastern markets are firmer. Our market is steady, but dull.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, March 25, 1897.

Dullness rules supreme in the share market. If it were not for cross-orders and other methods to make a good showing, the record of sales would be the smallest known. The muddle in the Hale & Norcross election is not calculated to help matters. The Fox combination have the books, office, all papers and control the mine, while the Grayson-Hayward combination have nothing to show beyond their organization. The latter have a majority of actual shares. Whether theirs are not is a disputed point; and not being properly issued, if Judge Slack's recent decision holds good, cannot be voted. The question is in court and will be settled soon. There is another case in court which ought to be decided soon, and that is the appeal to the United States Supreme Court testing the clause in the State Constitution against margin trading. With these two cases out of the way and also that of M. W. Fox against the old directors of the Hale & Norcross Company, and that of Theodore Fox against John W. Mackay in the Con. Virginia matter, we can then look for better times on the Comstock. Every week creates deeper disgust with outsiders at the way the market acts, and, as this grows, selling becomes the order. Unless things change within the next three or four months, there will not be a corporal's guard left as traders. So far as we can learn, not one of the broker's offices has a ticker. This more than anything else ought to show to what a low point the business has sunk, and yet they live in hopes that history will repeat itself and a valuable strike of ore be made unexpectedly. This has been done more than once, and it is not at all unlikely but it will be again, for the Comstock is prolific in possibilities and the unexpected. Interest continues to be centered on the work in Chollar on the Brunswick lode. The ore now out and in sight will cover the expense of opening up the 500-foot and 600-foot levels, and if the downward continuation of the ore shows an improvement on the upper levels, the shares ought to command higher prices; but if they do not, then present prices are too high.

The work in Con. Virginia and the long west crossdrift being run jointly by Con. Imperial, Challenge and Confidence, are being closely watched, for good results are expected to follow more extended work.

From the Comstock mines the news is practically unchanged. In Alta the superintendent seems to be doing his best to earn his money by prosecuting work, but which is not calculated to strike ore. The same remarks apply to both Overman and Caledonia, although in these two mines the work indicates that it is being done in such a way as to expedite exploiting later on. The work in the former is on the 900 level and in the latter on the 1100 level. No ore was raised last week. The gold-bearing ore found in Seg. Belcher has caused the shares to sell at very low figures. Those holding shares can console themselves with the knowledge that preceding the Con. Virginia deal the shares sold down to 5 cents, and would have gone still lower if the cent dealings had been in force. The decline helped to get shares by the manipulators. From Belcher there is nothing new to report. The letters continue to ignore the ore strike. It is shares, not assessment money, the managers want, and to get them they send prices down. From Crown Point there comes to hand the same old story told for weeks past. From Yellow Jacket no advices come to hand. Well-informed miners think well of the mine. Some go so far as to assert that large quantities of high-grade ore can be extracted when required by the powers that be. The Con. Imperial, Challenge and Confidence joint west crossdrift is being driven at a snail pace. No change is reported in formation. Some work is being done in Confidence on the level reported last week. Some ore has been milled which netted over $880. To get this out cost a considerably larger sum of money. No wonder outsiders have no confidence in Confidence. Alpha's official letter is nearly an exact copy of the preceding week's letter. It

would save time to have several copies struck off and only change the dates and feet run. Even the latter is not necessary, unless for the purpose of fooling the public. From Bullion nothing new came to hand. In Potosi they got into 6 feet of quartz assaying about $27 a ton, and then they ran for old ground, which they succeeded in striking, and, at the same time, struck down the market value of the shares. No work was done in Chollar. In Hale & Norcross they started a west crosscut on the 900 level. The official letter says that work was suspended on the 17th. From Savage, Gould & Curry and Best & Belcher nothing new has been received, so far as official letters show. In Con. Virginia they are working on the 1000, 1550, 1650 and 1750 levels. The letter from the superintendent indicates that work is being done for freer exploiting later on. Only nine tons of ore was raised last week. In Ophir they are working on the 1000 level and also Central Tunnel level. This company succeeds better in finding assessments than ore, or, at least, this has been the case for several years past. The work is in the same direction as reported last week. In Mexican they struck 75-cent ore the past week in their west crosscut on the 1000 level. The official letters do not contain anything worthy of note from Union, Sierra Nevada or Utah. In Andes they are raising from the 175 level for surface connection.

Interest on the Brunswick lode centers in Chollar. They are stoping ore on the 300 level. On the 200 level they have cut out for timber for a west crossdrift. They got ore 2 feet wide. On the 400 level they are opening north on the fifth floor of the north upraise. In the south drift of the 500 level they will run about 60 feet more and then crossdrift for the ore. They will soon be ready to commence operations on the 600 level. In Occidental they are working on the 550 and 850 levels. The ore in both levels is low grade. In Con. Virginia, Best & Belcher and Gould & Curry they are sinking shaft No. 2 and exploiting on the 320 level.

The following illustrates the changes of the week:

A REMARKABLE difference between Government estimates and prices made in competition occurred in the letting of the contract for Superior harbor. It is stated that E. and J. B. Brayman of Toledo, Ohio, took a big harbor contract at Boston recently at a low figure away from the American Dredging Company at Philadelphia. The latter company retaliated by bidding on the Superior harbor contract of 2,000,000 yards. The Government estimate for this work was $3,065,000. The American Dredging Company bid $1,986,000, and was confident of getting the contract, while the Braymans bid $2,275,000. Local firms learned of the war, and put in a bid of $1,655,000, which is $1,400,000 below the Government estimate. Six members of the Atlantic & Gulf Dredging Association pledged $50,000 each toward putting in a plant at Superior, and offered $1,000,000 to carry on the war if necessary. The lowest bid was 9 cents per yard, while the Government estimate was 15 cents.

THE highest building in New York is that of the Manhattan Life Insurance Company, which is about 324 feet high. The highest building in San Francisco is the Spreckels building, 304 feet. The San Francisco City Hall dome is 300 feet above the pavement.

Who Sees Your Advertisement?

Is an important question. When asked for an "ad" demand proof of extensive circulation among probable purchasers.

THE American Association for the advancement of science will meet in Detroit this year from August 11 to 17, and the British Association will meet in Toronto from August 18 to 25. Besides these fixtures, the four-hundredth anniversary of the discovery of America by Cabot is to be commemorated by the National Historical Association of Canada, who have arranged to hold at Toronto during the summer an exhibition of records, relics, documents, paintings, etc. Finally, the British Medical Association has resolved to visit Canada this year, and it will meet at Montreal on the 24th of August, its proceedings extending over the week.

Rainfall and Temperature.

The following data for the week ending 5 A. M., March 24, 1897, are from official sources, and are furnished by the U. S. Weather Bureau for the MINING AND SCIENTIFIC PRESS:

PROPOSALS FOR ROCK CRUSHER.

The Board of Supervisors of Butte County, California, hereby invites plans, specifications and proposals for furnishing the following named machinery, viz:

One Rock Crusher, with a capacity for crushing not less than 12 to 15 tons of rock, or cobble-stones 6 to 9 inches in diameter, per hour, at ordinary speed, rock to be crushed to not over 2 inches in diameter. Bids to state the price per foot for elevator attachment, and of rock screens.

One Road Roller, not less than 5 feet in width and to weigh not less than five tons.

All of the above machinery to be first class in every respect.

Bids will be received by the Clerk of the Board at his office in Oroville, Butte County, California, up to Wednesday, April 7, 1897, at 10 A. M. The right to reject any and all bids is hereby reserved.

By order of the Board of Supervisors.

ED HARKNESS, County Clerk.

Oroville, Cal., March 9, 1897.

OFFICE OF THE HALE & NORCROSS SILVER Mining Company, Room No. 11, San Francisco Stock and Exchange Building, No. 331 Pine street, San Francisco.

To the stockholders of the Hale & Norcross Silver Mining Company and to all others concerned:

Notice is hereby given that, pursuant to the consent, in writing, of the holders of two-thirds of the capital stock of the Hale & Norcross Silver Mining Company, duly filed in the office of said company, the principal place of business of said Hale & Norcross Silver Mining Company has been changed from Room No. 3 of the San Francisco Stock and Exchange building, No. 331 Pine street, in the City and County of San Francisco, State of California, to Room No. 1 in the same building, where the business of said Company will be hereafter transacted. This notice is published in accordance with Section 321 of the Civil Code.

Dated March 19, 1897.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

NOTICE TO CONTRACTORS.

The Monterey Power Company invites bids for putting in its entire plant, dam, flume, wheels, electrical apparatus and pole line from Little River (22 miles south of Monterey City) to Monterey and Salinas City, for the generation and transmission of electrical current of not less than 450-horse power; entire distance being approximately 37 miles.

Bids will be received up to SATURDAY, April 17, 1897, at 2 o clock P. M., at the company's offices, Monterey City, Monterey County, Cal., where plans and specifications may be seen.

All bids must be accompanied by a certified check for ten per cent of the sum of such bid. Checks to be payable to the company and to be held upon the usual conditions.

By order of the Board of Directors.

F. A. BOTSCH, Secretary.

SEALED PROPOSALS.

Bids will be received at the office of the undersigned until 5 o'clock P. M. on MONDAY, March 29, 1897, for one centrifugal pump of 8000 gallons capacity, to be placed in position in new pumping plant at foot of S street, in Sacramento City. Specifications on file at office of City Clerk. A certified check, made payable to City Clerk, for an amount not less than 10 per cent of amount bid, must accompany each bid. The Board of Trustees reserves the right to reject any and all bids.

M. J. DESMOND, City Clerk.

Sacramento, Cal., March 22, 1897.

MOTHER LODE MINE.

A superintendent of a large co-operating mine on the mother lode in California desires an associate with capital to take one-half interest in developing a prospect, located on the mother lode in Amador county, Cal., upon which he is doing development work, with the view of purchase. One hundred thousand dollars has already been expended upon it and its production has been about the same, but the sinking of a shaft 500 feet is necessary to obtain depth. DEWEY & CO'S Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Advice and Circulars free.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

California Building Stones.

The issue of the MINING AND SCIENTIFIC PRESS of February 20th contained an editorial calling attention to the fact that at the University of California at Berkeley the work of testing and examining the building stones of the State has been begun by Professor Lawson, with a view, primarily, to chose materials for the erection of the magnificent buildings contemplated in the schemes for the greater University of the State. It was stated then that the University authorities requested that quarrymen and others interested in deposits from which they believed good building material could be obtained should send two samples of each kind—one a 12-inch cube and the other a 4-inch cube.

JACOBY SANDSTONE QUARRY, HUMBOLDT COUNTY.

Already, Professor Lawson states, so many samples have been sent in that they are blocking up the already overcrowded museum. The work that will be done in this way will be of great value to the State. Examinations made will not only demonstrate the value of the stones of the State for structural material, but will in cases save much needless expense. That there will be a much greater use of stone for building material in this State than there has been in the past is indicated by the larger proportion of stone buildings being erected in San Francisco and other cities of California. The value of these examinations, made, as they will be, thoroughly and well, cannot be overestimated.

According to the report of the United States Geological Survey, the value of various kinds of stone produced in California in 1895 was only $715,450; yet in 1890 the value of granite alone was $1,329,018, and in 1891 $1,300,000. Considering the very small number of buildings erected of stone in the State compared with what will be in the future, this will show that this branch of the mining industry will in time play no small part. Probably in no part of the country may so many varieties of the commoner, as well as more rare stones, be found as in California.

There is hardly a county in the State in which building stone of one kind or another is not being produced for local consumption or shipment to the larger cities. Of course, up to the present time, exorbitant freight rates and poor facilities for shipping have made the cost of bringing to the building centers many better qualities of stone almost prohibitive. However, this is now being all changed.

Entry of Oil Lands as Placers.

The act recently passed by Congress to permit the entry of land valuable for petroleum or other mineral oils, has been published by the Commissioner of the General Land Office with his construction of it regarding its application to cases where claims have been initiated prior to February 11, 1897, when the law went into force. The new law is as follows:

An act to authorize the entry and patenting of lands containing petroleum and other mineral oils under the placer mining laws of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that any person authorized to enter lands under the mining laws of the United States, may enter and obtain patent to lands containing petroleum or other mineral oils, and chiefly valuable therefor under the provisions of the laws relating to placer mineral claims: *Provided*, That lands containing such petroleum or other mineral oils which have heretofore been filed upon, claimed, or improved as mineral, but not yet patented, may be held and patented under the provisions of this act, the same as if such filing, claim, or improvement were subsequent to the date of the passage hereof.

The Commissioner's construction of the law and instruction to the land officers is as follows:

It is to be observed that though the provisions of the placer mineral land laws are, by said act, extended so as to allow the location and entry thereunder of public lands, chiefly valuable for petroleum or other mineral oils, yet the substances named are not expressly stated to be mineral, in view of which it would appear that the prior assertion of a legal adverse claim to land valuable for petroleum or other mineral oils would preclude the acquisition of any rights thereto under the provisions of the mineral land laws.

Claims to lands of the character mentioned, heretofore initiated under the mineral land laws, are by said act expressly confirmed, but this confirmation must, of course, be construed as applying only to cases where, prior to February 11, 1897, no valid adverse claim to lands involved had been acquired under other than the mineral land laws.

In proceeding under this law you will act in accordance with the views herein set forth.

The Alien Land Law.

The law giving aliens the right to hold land in the Territories which was approved March 2d, last, will be of more interest to the mining industry than probably any other, particularly because foreign capital is turning toward investments so much in that direction. For that reason the law, a copy of which has been furnished the MINING AND SCIENTIFIC PRESS by John M. Wright of this city, is considered worthy of publication. It is as follows:

An act to better define and regulate the rights of aliens to hold and own real estate in the Territories:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that an act entitled "An act to restrict the ownership of real estate in the Territories to American citizens, and so forth," approved March third, eighteen hundred and eighty-seven, except so far as it effects real estate in the District of Columbia, be and the same is hereby amended so as to read as follows:

"SECTION 1. That no alien or person who is not a citizen of the United States, or who has not declared his intention to become a citizen of the United States in the manner prescribed by law, shall acquire title to or own any land in any of the Territories of the United States, except as hereinafter provided: *Provided*, That the prohibition of this section shall not apply to cases in which the right to hold or dispose of lands in the United States is secured by existing treaties to citizens or subjects of foreign countries, which rights, so far as they may exist by force of any such treaty, shall continue to exist so long as such treaties are in force, and no longer.

"SEC. 2. That this act shall not apply to land now owned in any of the Territories of the United States by aliens, which was acquired on or before March third, eighteen hundred and eighty-seven, so long as it is held by the then owners, their heirs or legal representatives, nor to any alien who shall become a bona fide resident of the United States, and any alien who shall become a bona fide resident of the United States, or shall have declared his intention to become a citizen of the United States in the manner provided by the law, shall have the right to acquire and hold lands in either of the territories of the United States upon the same terms as citizens of the United States: *Provided*, That if any such resident alien shall cease to be bona fide resident of the United States then such alien shall have ten years from the time he ceases to be such bona fide resident in which to alienate such lands. This act shall not be construed to prevent any persons not citizens of the United States from requiring or holding lots or parcels of land in any incorporated or platted city, town or village, or in any mine or mining claim, in any of the Territories of the United States.

"SEC. 3. That this act shall not prevent aliens from acquiring lands or any interests therein by inheritance or in the ordinary course of justice in the collection of debts, nor from acquiring liens on real estate or any interest therein, nor from lending money and securing the same on real estate or any interest therein; nor from enforcing any such lien, nor from acquiring and holding title to such real estate, or any interest therein, upon which a lien may have heretofore or may hereafter be fixed, or upon which a loan of money may have been heretofore or hereafter may be made and secured: *Provided however*, That all lands so acquired shall be sold within ten years after title shall be perfected in him under said sale or the same shall escheat to the United States and be forfeited as hereinafter provided.

"SEC. 4. That any alien who shall hereafter hold lands in any part of the Territories of the United States in conratvention of the provisions of this act may nevertheless convey his title thereto at any time before the institution of escheat proceedings as hereinafter provided: *Provided however*, That if any such conveyance may be made by such alien, either to an alien or to a citizen of the United States, in trust and for the purpose and with the intention of evading the provisions of this act, such conveyance shall be null and void, and any such lands so conveyed shall be forfeited and escheat to the United States.

"SEC. 5. That it shall be the duty of the Attorney-General of the United States, when he shall be informed or have reason to believe that land in any of the Territories of the United States are being held contrary to the provisions of this act, to institute or cause to be instituted suit in behalf of the United States in the District Court of the Territory in the district where such land or a part thereof may be situated, praying for the escheat of the same on behalf of the United States to the United States: *Provided*, That before any such suit is instituted the Attorney-General shall give or cause to be given ninety days notice by registered letter of his intention to sue, or by personal notice directed to or delivered to the owner of said land, or the person who last rendered the same for taxation, or his agent, and to all other persons having an interest in such lands of which he may have actual or constructive notice. In the event personal notice cannot be obtained in some one of the modes above provided, then said notice shall be given by publication in some newspaper published in the county where the land is situate, and if no newspaper is published in said county then the said notice shall be published in some newspaper nearest said county.

"SEC. 6. That if it shall be determined upon the trial of any such escheat proceedings that the lands are held contrary to the provisions of this act, the court trying said cause shall render judgment condemning such lands and shall order the same to be sold as under execution; and the proceeds of such sale, after deducting costs of such suit, shall be paid to the clerk of such court so rendering judgment, and said fund shall remain in the hands of such clerk for one year from the date of such payment, subject to the order of the alien owner of such lands, or his heirs or legal representatives; and if not claimed within the period of one year, such clerk shall pay the same into the treasury of the Territory in which the lands may be situated, for the benefit of the available school fund of said Territory: *Provided*, That the defendant in any such escheat proceedings may, at any time before final judgment, suggest and show to the court that he has conformed with the law, either becoming a bona fide resident of the United States, or by declaring his intention of becoming a citizen of the United States, or by the doing or happening of any other act which, under the provisions of this act, would entitle him to hold or own real estate, which being admitted or proved, such suit shall be dismissed on payment of costs and a reasonable attorney fee to be fixed by the court.

"SEC. 7. That this act shall not in any manner be construed to refer to the District of Columbia, nor to authorize aliens to acquire title from the United States to any of the public lands of the United States or to in any manner affect or change the laws regulating the disposal of the public lands of the United States. And the act of which this act is an amendment shall remain in force and unchanged by this act so far as it refers to or affects real estate in the District of Columbia."

John Muir on the Forest Reservations.

In another column will be found an article by John Muir, the great mountaineer—a plea for the preservation of the forests. Miners and prospectors generally know that these reservations will prevent large companies from ruining the source of supply of timber for the mines and be of the greatest benefit to them.

The vigor of the protest that has been made immediately suggests that self-interest is behind it. Those who are really looking out for the interests of miners and prospectors have never shown such activity in public matters.

The members of the United States Forestry Commission are broad-gauge, practical men, who have tramped over the mountain ranges of the West for the past twenty-five years and know every part of them.

It is protested that if the Commission propose any plan for the management and use of the forests they should have presented it before the reservations were made. Yet, in reply to this it may be said that the timber grabbers would in that case have had better opportunities to prevent their ever being made.

The Commission is now busy preparing a plan for forest management. The key note of their whole plan is fair play and use of forests without destruction. If in their plan nothing more should be done than simply stop forest fires, that would enormously reduce the loss. Four-fifths of the decrease in timber in the forests now is caused by fires. Their prevention can only be accomplished by the General Government.

The commission upon whose report these reservations were created concedes that it will be impossible to maintain them, unless some provision shall be made which will permit citizens to search for and develop valuable mineral ledges and deposits, and to utilize the timber within reasonable limitations.

If this provision is made, the miners should consider the reservation of these forests by the Government the greatest boon that could be conferred upon their industry. There is many an old and still prosperous mining district on the Pacific coast that is now suffering through the extravagant and wasteful manner in which the timber of the immediate neighborhood has been cleared off, without regard to the future. Many a mine is paying now twice as much for timber as it would had the neighboring forests been carefully conserved, and the timber taken from them wisely.

Concentrates.

THERE are fifty stamps in the mills in the Cracker district in Baker county, Oregon.

A BOSTON capitalist has bonded John Dobbins' copper property near Yerrington, Nevada.

LOCAL journals state that six new quartz mills will be built this season at Grants Pass, Oregon.

HIGH-GRADE samples of ore have been brought to Salt Lake from the Starlus mine at Bingham, Utah.

PANTING & HANNA have ordered a ten stamp mill for the Burnt River mine in Baker county, Oregon.

ASSAYER PUCKETT of the Denver mint predicts that Colorado will produce $20,000,000 in gold this year.

IN the Horsfal mine, the first one located in Boulder county, Colorado, a strike of rich ore has lately been made.

PREPARATIONS are being made to enlarge the mill at the Mercury mine in Utah to a capacity of 300 tons daily.

IN the vicinity of Ballarat, in the Panamint district, California, there are 150 prospectors, and more coming in every day.

TELLURIUM is being smelted on a considerable scale from Transsylvanian gold and silver ores, near Shemnitz in Hungary.

DR. C. E. AMYDON has deeded to Joseph C. Cramer the Silver Mountain mine near West Point, Calaveras Co., Cal., for $30,000.

THE mines of Butte, Montana, use 1,500,000 pounds of powder yearly—the Anaconda mine nearly two-thirds of this amount.

IT is proposed by the Sumpter Valley railway people to build a road connecting Baker City, Oregon, with the Seven Devils copper region.

IN Southern Oregon fifteen years ago it cost more to pay the freight charges on goods into the mines than the supplies now cost at the mines.

SOME Eastern people have been in eastern Nevada looking at copper prospects, and have made some purchases with a view to developing.

THE Gold Creek, Nevada *News*, says that mica crops out in the Ruby mountains, Elko county, distance sixty miles, and that it is of the best quality.

AN effort is being made to substitute electricity for steam in the mines at Cripple Creek, Colorado. The cost of coal at that place is from $6 to $7 per ton.

AT a recent closing of the Boston & Montana books it was found that there were 1700 stockholders, a gain of about 600 as compared with the previous quarter.

A LONDON syndicate has made an offer of $55,000 for 51 per cent of the stock of the Bonita Gold Mining Company's property near Grand Forks, British Columbia.

SUPERINTENDENT REICHLING, of the Anita mine, in Amador county, California, says a mill with fifteen or twenty stamps will be erected—probably during this summer.

UP to March 20, since January 1, there was shipped from the Kootenay mines ore and matte valued at $2,062,126.64. At this rate the year's output would reach over $9,000,000.

THE Parrott Company in Montana last October took a bond on the Hesperus copper property at $260,000, but, after sinking a double compartment shaft 236 feet, have given it up.

MINERS in Wyoming are arranging to call a convention for the purpose of devising ways and means of bringing the various mineral industries of the State before the public.

EASTERN people who lately purchased the Yankee Boy mine near Laramie, Wyoming, have struck a vein of copper which a press dispatch states runs fifty per cent in pure copper.

THE Silver Star district, Esmeralda county, Nevada, reports twenty-five paying mining properties. That county produced $360,000 in gold in 1896, second in the list, Lincoln being first.

THE discovery of valuable ore bodies in the southern part of the Leadville, Colo., district, may do much toward reviving the camp, and restore the activity which ceased with the strike.

A PRESS DISPATCH from Colorado Springs, Colorado, reports that the Mollie Gibson mine has been leased for a term of five years to a pool at a royalty of 25 per cent and a bonus of $25,000.

TEN shares Calumet and Hecla stock were recently sold in Boston at $370 a share—the highest price on record, at the rate of $37,000,000 for the whole of the stock of that copper property.

THE directors of the LeRoi mine at Rossland, British Columbia, state that they will soon erect a smelter, which will probably be located at Northport, Washington. The capacity proposed is 350 tons daily.

THE output of the Indian gold mines for February was 30,420 ounces, the largest monthly record. There has been a steady increase in the yield since January, 1893, when it amounted to 16,844 ounces.

THAT part of the Columbia & Western railway between Trail and Robsen, British Columbia, is expected to be open for traffic by June 1st, and connection will be made with Slocan lake points by Sept. 1st.

CAPTAIN J. B. DE LAMAR when sailing for Paris from New York last week cabled to his banker in Salt Lake to offer $1,000,000 cash for the Mercur mine. The offer was refused, according to the Salt Lake *Tribune*.

SALT LAKE and Ogden, Utah, men propose the erection of an electric power plant on the Bruneau river to transmit 2500-horse power to the Oro Grande mines, lying between the Bruneau and Owyhee rivers, Idaho.

ACROSS the bay from Ensenada, Lower California, a lead mine discovered some months ago has been developed and the vein—from 8 to 30 feet wide—carries, it is claimed, 68 per cent of lead and some silver, gold and copper.

C. W. SMITH, receiver for the Atlantic & Pacific Railroad, went into Rand district, in Kern county, California, last week, to, as he explained, look over the ground with a view to putting in a branch if the camp develops well enough to warrant it.

IN copper mining in the Lake Superior district in Michigan the rights are vertical from the surface, but in Montana it is under the United States laws, by which the owner of an outcropping vein can follow the same and all its dips, spurs and angles.

THE shipments of matte from the copper-nickel ores of the Sudbury district in Ontario, Canada, to the United States to be refined amounted in 1896 to 3,697,039 pounds against 2,668,661 pounds in 1895. This is the chief source of supply of nickel to this country.

THE report from the Alaska-Mexican for February shows: Period since last return, twenty-eight days: bullion shipment, $25,292: ore milled, 11,245 tons: sulphurets treated, 281 tons: of bullion there came from sulphurets $9590: working expenses for period, $22,216.

A LEDGE of high-grade ore has been cut in the Ontario mine at Park City, Utah, on the 1100-foot level. The same ledge shows on upper levels but not as wide, and the managers expect to cut it on the 1500-foot level. This, if true, will be of vast importance to the district.

YEE SING, a police officer under the Chinese Consul in San Francisco, in an interview with a writer on the *Tribune* in Salt Lake, last week, stated that there are now in California 5000 Chinese engaged in washing gravel and that their earnings averaged from 50 cents to $1.50 a day.

ALEXANDER B. HILL, manager of the Mountain Copper Company, in Shasta county, California, has secured a new bond on the Ballakalala or Windy Camp group of forty claims and development work on a large scale will be commenced immediately to exploit the large masses of sulphide ores.

THE directors of the Mountain Copper Company, in Shasta county, California, will come out from England and visit the property this month. It is intended to bring the question of the ill effects of the fumes from the smelter to their notice, and some action will probably be taken to abate the nuisance.

THE ore shipments from Rossland, British Columbia, for the week ending March 29th broke all previous records and reached a total of 1230 tons. Of this the LeRoi shipped 1060 tons, or more than that mine ever shipped in a like period before. The War Eagle shipped 120, Iron Mask 15, O. K. 14 and Giant 21.

IN Yokohl valley, eighteen miles east of Visalia, Cal., there have been discovered some copper ore deposits, and people interested have secured an option on the tract of 3700 acres of land: that there is plenty of wood and water close by, and the amount of ore appears to be unlimited, containing 22 per cent copper.

AT the Anaconda copper mines in Montana the St. Lawrence shaft is down 1300 feet, the Never Sweat 1430 feet, High Ore No. 1 1200 feet, and High Ore No. 2 1600 feet. The work of connecting all the mines of this company underground is nearing completion. Compressed air will be used to transmit ore from where it is mined to the stations.

THE manager of the De La Mar Mining Company of Idaho has cabled to London the following returns for February: Crushed during the month, 3545 tons; bullion produced in the mill, $41,770; estimated value of ore shipped to smelters, $700; miscellaneous revenue, $95; total product, $42,565; total expenses, $38,030; profit for the month of February, $4,535.

THE famous appeal of the Wells vs. Petty case, which had to decide the meaning of the expression "You will be in on it," spoken by the defendant to the plaintiff, in locating a mining prospect, was decided by the full court in Victoria, B. C., March 26th, in favor of Wells, giving him a half interest in the Monitor No. 2 mine, at Three Forks, and an extension.

THERE is a rule at the Ajax mine, in Utah, that no one may be admitted to the mine without a passport from the board of directors. Last week the owner of 115,000 out of 300,000 shares of the capital stock of the company, Samuel McIntyre, in the absence of the manager, went into the mine without a passport. In consequence, three men who admitted Mr. McIntyre lost their jobs.

IT is announced at Vancouver, British Columbia, that the Dunsmuir estate is interested in the Texada mines and that the Esquimalt and Nanaimo railroad property of the Dunsmuir's is to be extended to the Union coal mines, where coke is made for the Kootenay smelters, and that if the development of the Texada mines continues to be favorable a smelter will be built in that vicinity.

THE Alaska Juneau Company, which recently purchased the Lane-Campbell properties, is preparing to prospect the ore body by sinking a 1000-foot shaft, keeping its forty-stamp mill in operation on the rock taken out. If the ore body continues a large mill will be erected on tidewater and an electric plant on Salmon creek. To connect mine and mill an electric railway may be built.

R. S. MCCONNELL, government geologist, who visited Kootenay last year, has completed some analyses of samples obtained from Trail Creek properties, and in ore from the Columbia Kootenay he discovered gersdorphite, a sulphide of nickel and arsenic. The nickel value of the gersdorphite in the rock examined was twenty per cent, which may mean that the Columbia Kootenay has some considerable value in nickel.

AN English mining syndicate, in which Lord Sudeley and Sir Bache-Cunard are leading members, and with whom J. D. and Dr. Redding and E. A. Wiltsee are associated, last fall purchased the Tarantula, an old idle mine near Tuttletown, Tuolumne county, California, for $20,000 and began development work. Last week a strike of phenomenally rich ore 2 feet in width was made. Hoisting works will be erected and a shaft sunk down 200 feet.

THE Goodenough Mines Company of the Slocan, British Columbia, in its statement recently published shows that from January 14, 1895, to March 12, 1897, there has been shipped from this property 303 tons, 1807 pounds of ore of an aggregate value, according to smelters returns, of $61,581,76, which is at the rate of $203.12 per ton of crude ore. The highest assay of silver to the ton of any single shipment was 817.6 ounces and in lead 70.5 per cent.

ONE of the experts who has lately been examining the Cedros Island mines, off the coast of Lower California, for Kidder & Hellman of Indiana, says that so far no price has been named by the Cedros Island Company, nor has either party to the proposed deal talked regarding the many things necessary to be cleared up, before the trade could be made. The ore is plentiful, but of low grade, and Mr. Kidder will not recommend touching it with less than a 100-stamp mill.

A MEETING of the Executive Committee of the California Miners' Association was held last Wednesday evening, in San Francisco, for the purpose, mainly, of considering the present status of the mineral land bill, and the Legislative Committee was instructed to use every effort in furthering the measure, as it appears to have a good chance to pass at the present extra session of Congress. It was decided to ask that the clause in regard to Oregon lands be left out of the bill, for it would then be more likely to go through. The president, Mr. Neff, and the secretary, Mr. Sonntag, were added to the committee appointed at the last convention to confer with the United States Debris Commission.

THE Toronto *Globe* advertises the prospectus of the Colorado Gold Mining and Development Company, which has been incorporated under the laws of West Virginia by men living in New York, and which has its property in Kern county, California, its principal place of business in Rochester, New York, and to cap the climax the stock is being placed in the Toronto market. The capital stock is placed at $2,000,000. The mines are the Keyes, Three Chimneys and other locations in Kern county.

THE St. Petersburg Department of Mines has issued a book on the mineral resources of the Caucasus. The author states that gold is met with in the Archæan rocks on the southern slopes of the Caucasus, as well as in alluvial deposits. On the whole, however, the Caucasus is poor in respect to gold deposits. Lead ores occur in the districts of Artwin and of Batoum, but they occupy a subordinate position in association with copper ores. Copper ore, usually met with in beds, is widely distributed, usually in company with lead and zinc.

THE Alaska Treadwell Gold Mining Company has commenced work on a 1000-foot five compartment shaft 8x22, the first 270 feet to be completed May 1st, when a new hoisting plant will be in place and the shaft driven 20 feet per day. If satisfactory the company will erect a mill of 300 additional stamps, and the working force increased to nearly 1000 men. The company has decided to replace the present water and steam power plants by which the Treadwell and Mexican mines are operated, with electric power. The cost of the plant is placed at $500,000.

THE Montana Company at Marysville, Montana, have decided to put in the long talked of plant at the Drum Lummond mine for working over the tailings dump of about a million tons, and contracts have been entered into for its erection. Cyanide will be the process and the capacity will be 500 tons daily. The results of the working of the process on such a large scale will be looked forward to with interest—particularly as to the cost per ton. There are many other dumps in this country held by owners on speculation, waiting for further reductions in costs of working.

THE annual report of the Alice Gold and Silver Mining Company of Walkerville, Montana, shows a product for the past year of $547,416.95 in silver and $16,465.27 in gold, the whole reaching a total of $563,882.22. During the year there was 548 bars turned out of the mill, while in addition to this 4385 tons of base ore were sold, the whole showing an average of $32.70 per ton. In the Blue Wing claim the mill returns show an average of 100 ounces silver and gold to the value of $40 per ton, the width of the pay-streak varying from 10 inches to 2 feet, with the vein 4feet between walls.

THE annual report of the Boston and Montana Mining Company states that the electrolytic plant at Great Falls, Montana, will soon be producing 3,500,000 pounds per month. The gross receipts were for the fiscal year $6,413,307, the total expenses $3,534,283, the net earnings $2,674,350. Dividends, $1,500,000; surplus for year, $1,174,350. Total surplus, $2,740,328. Ore reserves, tons, 950,000; assets, $3,128,971; liabilities, $388,642; and surplus, $2,740,328. The total dividends declared to date since the first one paid in August, 1888, is $5,375,000. The gross receipts for 1896 amount to $1,415,076 more than in 1895, while the total operating expenses have increased about $900,000.

IT has been suggested that a convention be held in Denver, Colorado, during the present year to consider the subject of gold mining. On this subject the Denver *Republican* says: "Intelligent Colorado people know that through the development of the gold resources of this State local prosperity may be secured. But of this the East is ignorant. It has been printed hundreds of times in Colorado papers. But comparatively few Eastern people have heard anything about our claim in this respect, and possibly some who have heard have attributed it to idle boasting." It is further suggested that the convention be not representative of Colorado only, but that delegates be invited from all other gold-producing States and Territories in the Union, and also from British Columbia and Mexico.

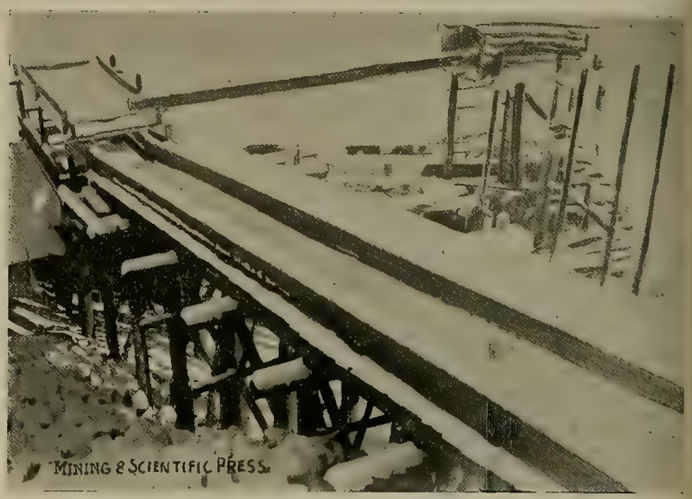
UNDER date of March 30th, Secretary Sonntag, of the California Miners' Association, writes: "I deem it necessary that the journal representing the mining interests of the State of California should be notified of the fact that the California Mining Association is very sadly in need of funds. I much regret to state that this year the counties which have very materially aided in the good work of the association have not responded to appeals of its officers as they did last year. It has been decided by President Neff to have Mr. S. K. Thornton, of this city, visit the mining counties on a collecting tour. The work performed by the association speaks for itself. It is to be sincerely hoped that the miners of California will respond liberally to our appeal. If the organization is to be maintained, it has got to have the support, not alone moral, but also financial, from the miners of California. Last year, at the annual convention, a showing was made whereby the entire indebtedness of the association had been paid, and over $500 still remained in the treasury, but we have had considerable expense for the convention and other matters incidental to the work of the organization. None of the officers draw a dollar of salary, and it is certainly to be hoped that this last appeal will bring about good results."

THE Dingley tariff bill passed the House of Representatives last Wednesday, March 31st, and now goes to the Senate. The lead schedule is as follows: "Imported lead-bearing ores of all kinds shall pay a duty of 1 cent per pound: *Provided*, That on all importations of lead-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of government officers, who shall be stationed at such establishments, and who shall submit the samples thus offered to a government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample, and upon his report of the lead contents of the ore the import entries shall be liquidated thereon. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph. Lead dross, lead bullion or base bullion, lead in pigs and bars, and old refuse scrap lead, fit only to be manufactured, 2 cents per pound; lead in sheets, pipes, shot, glaziers' lead and lead wire, 2¼ cents per pound."

Gold Mining in Siberia.*

Written for the MINING AND SCIENTIFIC PRESS by
RUSSELL L. DUNN, M.E.

Gold mining has been profitably carried on in Siberia on a large scale almost as long a time as it has in California, but in technical development it is still in its infancy. While elsewhere in the world where gold is mined the processes and methods employed are the most advanced that the experience of California and other districts have developed, the Siberian gold mining is for the most part limited to the knowledge and methods with which the industry started there. The prominence acquired by gold mining during the last few years has directed attention to Siberia as a possible source of large gold returns through the use of the capital and experience of other countries. It has very naturally been presumed that a country which could for many years produce so large an amount of gold, using primitive methods and appliances, could produce very much more and much larger profits by the use of foreign capital and experience. As the conclusion of the study of Siberian mines and mining conditions on the ground during the last few months, I should say that, while this presumption is partly true, it is very largely misleading.



Siberia is a large gold producer, because it is a very large country. The unconscious comparison of yields is made with countries very much smaller than it, and, consequently, to the disparagement of the latter. In Siberia gold is found scattered over an area about 3000 miles east and west by 1000 north and south. In addition, there is the small Ural district, not included in the preceding, from which comes a large part of the total annual production credited to Siberia. In my recent visit, my route of travel to and from the country crossed the Urals, south of the gold mining district, and thence was by the line of the Siberian Transcontinental railroad, across the vast plains of the Obi river system and the low hills of the divide between it and the Yenisei basin to the latter river. From here the main overland wagon road taken runs through the foothills of the Altai mountains to Irkoutsk, on the Angara river, a distance of about 700 miles. Thence, crossing Lake Baikal, the route was over the plateau region lying close up to the summit of the Altais, which it crossed into the headwaters of the Shilka, the principal northern tributary of the Amoor river, and descending the canyon of that stream into the heart of the Nertshinsk district, 1100 miles from Irktousk, where I made a detailed examination of a tract of mining lands nearly as large as the entire gold-bearing Sierra region of California. Though close to the navigable Shilka river, I was still nearly 2000 miles by that river and the Amoor from the Pacific ocean. The gold-bearing district may be considered as extending from the Yenisei river to the Pacific ocean and from the southern limit of the Amoor drainage and the Altais northward till the foothills disappear about the Arctic circle in the vast swampy plains that border the Northern ocean. Considerable as was the area examined by me and the territory covered in my route of travel, it is only an insignificant fraction of the the total gold-bearing area described. Still, with all the comparison that it was possible to make from the published reports on other fractions and inquiry of Siberians who were informed, I am assured that the regions seen by me are fairly representative of the whole.

All of the gold yield of Siberia has up to the present time come from shallow surface placers, such as were worked in the river bars and foothill gulches of California by the first gold seekers. These shallow placers in Siberia are numerous, but scattered, and only exceptionally are they rich, measured by the yield of similar California placers. The evidence of formation from the direct erosion of auriferous quartz lodes seems to me conclusive, though in the few instances that I learned of in which the quartz lodes were discovered, the Siberian miners failed to appreciate their gold-bearing value. These lodes seem to be very similar in character to our California lodes, and to have been formed, like them, in connection with intrusive eruptive rocks. They have apparently neither been eroded very deeply nor by torrential streams, so that the gold of the placers is not very far from its source in the lodes. The erosion has all been done by the existing streams, which have made flat, swampy valleys, a portion of which form the placers. Not every valley or gulch is auriferous; in fact, the proportion of the whole number is surprisingly small. Also, only a small portion of the length of the auriferous valleys is sufficiently rich to be considered a placer. While, as a rule, much wider than the stream that formed it, the placer is seldom over a third of the width of the valley that contains it. The depth of the placer varies from a few inches to 30 or 40 feet. Only the lower fourth of this resting on the eroded bedrock is auriferous. The remainder is a barren overburden, similar in physical composition to the other portion, except that it contains no gold. Through a vast region, including that which I particularly examined, the placers are perpetually frozen, except for the couple of feet or so of swampy surface. The method of working these placers under such unusual conditions is quite interesting, though not to be commended as economical. It is in two stages—first, prospecting to determine possible values, and, second, the exploitation proper. Both are controlled by the physical conditions created by the climate. The time required as a result of these conditions from the initiation of prospecting to the prosecution of the exploitation is three years, two of which are required for the prospecting and the third for the working of the ground located by the prospecting as sufficiently rich in gold to pay a profit.

Prospecting is done as follows: In the late autumn in the valley that has been selected for prospecting tranverse lines are staked out about one-third of a mile apart and points designated in these lines spaced 40 feet between, at which points prospect holes, termed "shurfs," are to be sunk. As soon as the swampy surface is well frozen the work of sinking these shurfs is commenced, one or two men working together, sinking a number simultaneously. In dimensions they are about 7 feet square and reach to bedrock at depths from 6 to 25 feet. To dig them the ground is first thawed out by building fires. These soften the ground to a depth of 7 inches for each firing, the softened ground being removed by the pick and shovel. When gold begins to appear in the ground each successive 7 inches of softened wash is deposited by itself by the side of the shurf and marked with a stake giving its depth from the surface. The foreman or engineer prospects these saved layers and finally with a 72-lb. sample washed either in the Siberian batea (a shallow wooden bowl about 22 inches in diameter) or in the

SIBERIAN GOLD WASHING MACHINE.

SLUICE, ETC., OF WASHING MACHINE.

SIBERIAN FLUME BUILT ENTIRELY OF POLES CAULKED WITH MOSS.

PROSPECTING.

* The photographs from which the engravings with this article were made, were taken on the ground by Mr. Dunn for the MINING AND SCIENTIFIC PRESS on the occasion of his visit to that region in September and October, '96.

Siberian sluice (which has its nearest comparison in a mortar mixing bed), and determines the weight of gold that a unit of 3600 pounds of the wash will contain. This he marks on a rough plan map of the shurfs and also marks the respective depths of overburden and of "pay." This washing is usually done in the following summer. From the mapped figures he decides whether or not to prospect further. If sufficient gold is shown to pay on working, other intermediate lines of shurfs are staked out, about 100 feet apart this time, and in the following winter they are sunk, prospected the next summer and mapped. These more complete mapped figures may justify exploitation and possibly they may not. If the engineer decides that they do he plats on the map what is termed a "project," designating the boundaries of a pit to be worked and calculates the several dimensions of it: length, breadth, area, depths of overburden and pay, cubes of each, average estimate of gold yield per unit of 100 poods (3600 lbs.) of pay, and the total estimate of gold content. On this map the subsequent exploitation is based.

The present method of exploitation begins with taking the ground mapped out as a workable project in the early winter. Buildings (log structures) are erected close to the works for the men and horses to be used, and advantage taken of the snow to sled in all the supplies and forage for the coming summer as well as for the winter. The pit is staked out to conform to the map made by the engineer, the ground within is cleared of timber and brush, and the surface to the depth of 3 feet or less is removed while half frozen, as it works easier then than when a swamp in summer. With this upper 3 feet go all the tree stumps and roots. The ground is broken out in large lumps with a heavy crowbar used a churn drill, broken up with a sort of pick and shoveled into dump carts which deposit it alongside of the pit as convenient. A ditch is constructed to divert the water of the stream in the valley and to provide water for the washing machine.

This last is prepared or started. It is located at or near the lower end of the pit and constructed of round timbers. A driveway on an incline is built on trestle bents up to a platform from 25 to 30 feet high above the surface. The carts carrying 1000 to 1600 pounds of auriferous earth dump on this platform over a shallow chute conducting to the washing sluice. From the ditch above referred to (or replacing it entirely if all the water is taken) a flume made of round poles, caulked with moss, on trestle bents, brings water to the machine. This is fed in at the head of the sluice with the auriferous earth and washes it down the sluice. The sluice is a trough made of smoothed square timbers or planks, 6 inches deep, 2 feet wide and 30 feet long (different machines vary these dimensions), set on a slope of about one drop to six horizontal. Wooden riffles are set in the bottom to catch the gold, and there are inclined platforms alongside used by the workmen in removing large rocks and clay masses. The former are piled alongside as convenient and the latter thrown into a box having a sheet-iron perforated bottom set at the foot of the sluice. Here they are rubbed up with water fed from a branch of the flume till they pass through the perforations into another sluice set at even a steeper angle than the first and mingle there with the washings from the upper box. At the foot of the sluice box coming from the dump platform is a box arranged to take the cleanup from the riffles to the cleanup room (made of slabs) and from the termination of the second sluice a similar box takes the riffle contents to the cleanup room. This last is furnished with a so-called Siberian sluice and a water supply from the flume. From the lower sluice the structure is continued in a narrower sluice (made of poles caulked by moss), still on a steep grade till the bottom is about 3 feet from the ground and then takes very nearly the slope of the surface of the valley, and is continued to discharge the water below a point at which it can back into the excavated pit, a distance from 150 feet upward. At the upper end of this pole sluice the heavy tailings, sand and gravel are caught in one or more traps built the full width of the sluice, with open bottom close to the ground. As tailings accumulate they are removed from below, shoveled into carts and dumped in piles as nearby as convenient.

The description of the machine (?) has been accompanied by a description of its operation, and to that extent is anticipating. The upper 3 feet of the surface of the pit is all that is removed during the early winter. In the following spring, soon as the ground thaws, the remainder is removed in benches of 3 feet or so in depth, the extent of the thaw, horses and carts being used, and the overburden being removed separately from the auriferous bottom. The latter goes to the machine and is treated as above described. Local conditions modify the description of machine given above, advantage being taken of an old pit or steep hillside sometimes, and occasionally a revolving perforated iron cylinder is used to wash the gravel.

As above stated, the Siberian placers are not notably rich and the cost of working by the method described is high. The minimum that will pay costs is about 30 cents a cubic yard, measuring both overburden and pay, and in some districts 50 cents. The placers worked range in yield from the minimum figures given above up to $2 and $2.50 in the richest placers. It is hardly necessary to say that the lower yields are more often obtained than the higher, and in no case should expectations of continued return be based on these latter. While the character of the placers and the manner of their formation are such that they frequently contain rich sections, these rich sections are quite limited and short-lived if actively exploited. Absolutely, compared with placers now being worked in California and Oregon, they are not as rich. In gold content the average Siberian placer has less than $50 per linear foot of channel. In California the average is safely double that.

The cost of Siberian placer mining can be materially reduced, but there does not seem to be much opportunity for our hydraulic methods. They are out of the question in the frozen placers and only exceptionally available for placers that thaw out in summer down to the bedrock.

Quartz mines cannot be said to exist in Siberia yet, but auriferous ledges unquestionably head every placer deposit. Some of these, in the aggregate an enormous number, will undoubtedly make quartz mines offering possibilities of profit equal to those of any other country. The industry has to be created, however, and practically entirely from the outside. Even the prospector who is to find the ledges is unknown in Siberia. There are no tools in stock, or even sample, that a quartz miner must have. I doubt if even a gold pan could be found or, except at the mint at Irkoutsk, an assay outfit. There is no mining or milling machinery, and there is neither the knowledge nor plant to construct it. It is doubtful if there can even be found the mechanical skill required of mine blacksmiths and millmen. All of this is the more surprising considering the long occupancy of the country by the Russians and the gold mining industry developed during the last fifty years.

What the country needs is many of the all-round working miners of California, men who besides being miners are mine blacksmiths and carpenters, can assay quartz, operate a hoist and run a stamp mill. It is not, however, a country for them to go to, except under engagement. The conditions of life are not pleasant, and the language and fixed habits of the people difficulties hard to contend with. There should be quite a good market there, (to be developed of course, for the Siberian miners do not themselves know what they need) for certain types of light portable mine and mill machinery and mining tools. The climatic and transportation conditions impose limitations on quartz mining operations that rarely have to be considered in other countries. Neither the roads nor road vehicles admit of the transporting of heavy machinery. Distances from bases of supply are often enormous and the means of communication poor. Telegraph lines are few and the letter post exasperatingly uncertain, stopping entirely in the last month of autumn and in the first month of spring.

Siberian mining conditions interested me particularly by reason of the conditions of mining in Alaska being comparable. The latter country would seem, however, to offer the better present opportunities. The climate is more moderate, transportation facilities considerably better, and there is on the ground exactly the class of intelligent miners required to rapidly and economically build up a profitable mining industry. A few years of the energetic exploitation which has built up the Transvaal gold mining industry will, however, result in the disappearance of most of the existing difficulties in Siberia and will enable the prosecution of the industry on even terms as to costs with other countries. This is comprehended by the Siberian mine owners and the Russian capital now active in developing the enormous dormant gold-producing resources of their country. It is quite in reason to anticipate a very large increase in the annual gold yield of Siberia, possibly to the extent of doubling its present figure, within five years.

"FIRING" FROZEN GROUND TO SINK SHURFS.

SIBERIAN ROAD RIG FOR SUMMER.

WINTER TRAVEL IN THE MINES.

Practical Treatment of Pyritic Gold Ores at Gibbonsville, Idaho.

Written for the MINING AND SCIENTIFIC PRESS by C. C. BURGER.

A general description of the property of the American Developing and Mining Company at Gibbonsville has been published, but it is thought that a more detailed sketch of the reduction plant, and the methods of treatment employed therein, may prove of interest.

The problem to be solved was the economic treatment of a low-grade pyritic ore, averaging in value about $10 a ton. The character of the ore is magnesium slates and quartz, more or less impregnated with iron pyrites. These pyrites are fairly pure, containing from .5 to 1 per cent copper, and occasionally a trace of lead, while arsenical pyrites are rather frequently encountered. The ores of this section were worked, as long as they were free milling, by arrastras and primitive stamp mills; on turning base, as the mines became deeper, many methods were employed to save the values. Several badly constructed chlorination works, a cyanide plant, a process consisting of roasting the ore and subsequently amalgamation, were tried, all of which proved total failures.

The success of the plant designed and operated by Bernard MacDonald and the writer for the past year and a half is conclusive evidence that such ores are readily amenable to careful treatment.

The general character of the plant is stamping the ore wet, running the pulp over copper plates, the sulphurets in the pulp being then saved on Frue vanners. The concentrates thus obtained are roasted in a Pierce turret furnace, supplemented by a small reverberatory. The roasted ore is then subjected to barrel chlorination.

The ore as delivered from the mine is run through a Blake crusher and Cornish rolls, falling into the battery ore bins, about ¾ to ½ inch in size.

The stamp battery consists of thirty 950-pound stamps. The drop is from 6½ to 7½ inches, 94 to the minute. Size of screen used, 30 mesh, No. 29 Tyler steel wire. The mortars are narrow, double discharge, the height of the latter being maintained at about 4 inches. Eight-foot silvered copper plates are placed in front and back of each battery, the grade being 2 inches to the foot. The whole design of the battery is to attain, by means of a short, quick drop, comparatively coarse screen and low discharge, a rapid crushing and discharging of the pulp with the production of a minimum amount of slimes. We endeavor to strike a mean between the extremes of sliming the sulphurets too greatly and that of saving too little of the gold contents of the ore as amalgam. The battery accomplishes this very successfully, its daily output being from three and a third to three and a half tons to the stamp; together with this rapid crushing, 50 to 55 per cent of the value of the ore is left on the copper plates. The sulphurets in the pulp are left in such a suitable condition for concentration that enough concentrates are saved to bring the total recovery of the values in the ore to 90 per cent and over.

A word about double discharge mortars may be of interest here. Many objections are raised against this style of battery, such as that the back screen is too quickly broken or worn out by the ore as it drops from the feed chute, being dashed against it by the falling stamps; that a back screen is very unhandy to get at, and the battery men will not take pains to keep it open and clean, and so on. Our experience is to the contrary. The back screen lasts as long as the front one—from ten days to two weeks—the additional discharging capacity accentuates our speed of crushing at least one-third, and we think that a double discharge mortar is eminently suitable where the fast crushing of a pyritic ore, with the production of as few slimes as possible, is desired.

After the pulp leaves the battery tables the amount flowing from each ten stamps passes through a Brown hydrometric sizer, where it is divided into five classes, each of which flows onto a 6-foot Frue vanner, adjusted as to speed, inclination, etc., to conform to the size pulp it is intended to treat.

This method of sizing mill pulp before concentration has proven very successful here. The coarsest material is treated on a machine making 208 shakes per minute, with a 6-foot per minute belt travel, the inclination of the belt being 3½ inches. The finest material is treated on a machine making 174 shakes, with a 4-foot belt travel and 2⅜-inch inclination. The three intermediate vanners are graded proportionately.

Sizing before concentrating on vanners is a subject much discussed and combatted at present. Our experience, after numerous tests and assays of feed and tailings, lead us to assert that such treatment is highly successful and eminently desirable; in fact, without sizing, our saving of concentrates would not be nearly as great as it is. Concentrating on vanners may be likened to hand vanning. In the latter, if it is desired to separate coarse material, it is only common sense to give the pan a quick motion. If the material desired to be saved is very fine and impalpable, the operator will proceed slowly and carefully. Will one not make a better saving by separating his pulp into sizes, giving each size the proper motion, than by treating a mixture of sizes by a motion adapted to neither the coarse nor the fine particles? In machine vanning the reasoning is exactly similar, and our experience bears it out in practice.

One authority—Mr. Goodale of Butte, Montana—asserts, in his article on ore dressing, as carried out in Butte, that better results are obtained by treating a mixture of sizes, one of the reasons given being that, in his opinion, the coarse sulphurets serve as a trap for the fine material, preventing the flow of water from washing them away. This may be true when the mineral is all settled down upon the belt, but how would it affect the material, while in suspension, before it reaches the belt? This is the danger point in concentration. It is not nearly so difficult to recover mineral that is once settled on the belt as it is to get it there.

Reasoning and theory on either side of the question are all very well, but results are what count. The facts that our percentage of extraction ranges from 90 to 93 per cent of the value of the ore; that a well constructed canvas plant, built to operate on the tailings, was an economic failure, the per cent of slimes lost from the vanners being too small to even pay the expense of running the plant, would show, as compared with the results obtained in some mills treating a similar class of ore, that sizing is a decided advantage and certainly does no harm.

The concentrates obtained are elevated to a feed bin in the top of the roaster building. This plant comprises a standard double hearth Pierce turret roaster, supplemented by a small single-deck reverberatory, the latter capable of holding two 1½-ton charges. This type of mechanical furnace is so well known that it is hardly necessary to describe it, beyond stating that the hearth is a complete circle, and the machinery moving the arms and rabbles is placed inside the masonry. The ore is stirred and conveyed around the hearth by four rabbles fitted with stirring plates, these rabbles being connected with arms radiating from the center of the machinery pit. A current of air is forced through the arms, rabbles, etc., by a blower, which not only keeps the ironwork exposed to the heat cool, but materially assists the desulphurization. Each hearth has two fire boxes. At present we use only the upper hearth, this, with the reverberatory, having a capacity of twelve to fifteen tons of concentrates in twenty-four hours. The feed is automatic, the sulphurets are evenly distributed, stirred and conveyed around the hearth, past the two fireboxes and discharged through a slot. The sulphur contents of the concentrates varies from 35 to 40 per cent. The roasted ore as discharged carries about 1 per cent sulphur, existing principally in the sulphate condition. This is introduced into the reverberatory in ton and a half ton charges and subjected to a strong heat, until the sulphate salts are destroyed, usually in two to three hours. The roasted ore from the reverberatory is conveyed to the cooling floor, from whence it is elevated to the storage bins in the chlorination department.

The feature of our roasting works is the use of the modern mechanical furnace to accomplish by far the greater part of the work. The application of this type of furnace is not new for roasting crude ore, but it is the first instance, as far as we are aware, of its use for roasting concentrates for chlorination. It may be said here that roasting crude ore, carrying from 2 to 5 per cent of sulphur, and concentrates, containing 40 per cent, are two very different undertakings. The use of the Pierce furnace, as against the ordinary reverbatory, enables us to make a very considerable saving in the cost of labor per ton of ore. For roasting twelve tons of concentrates, one man to a 12-hour shift is employed on the turret furnace, and two men to a shift on the reverberatory, or six men all told. To do the same work by reverberatories would require four 3-ton furnaces, each employing four men, or sixteen men all told. This latter case is taken from a plant in actual, successful practice. The question of six men against sixteen in a locality where wages are $3 a day is a very important one.

The cost for repairs, wear and tear on the mechanical furnace is very slight, especially when care is taken to see that all working parts are properly set, adjusted and regularly oiled. No dust must be allowed to settle on the machinery or even enter the pit. Attention to these matters will ensure a long life to the machine. The principal wear is on the stirring blocks fastened to the rabble arms; these at the end of six months may be bent and warped so that they do not stir the ore properly and carry it forward too rapidly. We always have another set of rabbles fitted with new blocks, ready to put in position when this occurs. The rabble arms themselves last indefinitely. The current of cold air passing through them keeping them from being burnt or distorted out of shape.

The success of the application of the mechanical furnace for roasting sulphurets is very gratifying. It is a step in the right direction, and its employment in that connection is certain to extend.

The chlorination plant comprises two lead-lined, steel-shell barrels, containing 65 cubic feet of space, or large enough to hold 1½ tons of roasted ore, together with the necessary chemicals and water. Below the chlorinating barrels are placed two filter tanks, of steel, lined with lead. The filtrated solution runs into storage tanks on the next floor below, from which it is drawn off into precipitating tanks, where the gold is thrown out of the solution by ferrous sulphate solution. Sufficient water to make a thin pulp is introduced into the barrel, then a measured quantity of sulphuric acid, 66° Beaume, next a ton and a half of roasted ore, and, lastly, the requisite amount of chloride of lime. The barrel is then sealed as quickly as possible and set in motion. There is no filter or projection of any kind inside the barrel, it being a smooth-surfaced cylinder, barring the lead caps over the bolts fastening the lining to the shell. It is asserted that projections or stirrers inside the barrel exercise a beneficial effect by causing a more thorough mixing of ore and chlorinated solution. We found the per cent of extraction to be exactly the same whether stirrers were used or not. Moreover, these projections are difficult to keep in place, unless fastened under the lead lining, in which case the lead on the raised surfaces soon wears through.

In seeking for a quick, labor-saving filtering device it was decided to use an upright, lead-lined cylinder, supported on trunnions, and provided with gears and a crank, so that the tank could be inverted by hand. In the bottom a wooden filter frame is placed, over which asbestos cloth is stretched and securely fastened by a chime driven in tightly all around the frame, the cloth passing under the chime. This method of securing the cloth answers very well, we never having one tear loose. The portion of the tank containing the filter is detachable, and can be quickly taken off and replaced when it is necessary to put in a new cloth. The tank is sufficiently large enough to hold the charge contained in the chlorinating barrel and the necessary wash waters, and is provided with a cap, carrying compressed air and water connections. The filtrated solution passes out at the bottom through a rubber hose and lead pipe to the storage tanks below. At the end of three hours the chlorinating barrel is stopped, the cap removed and the contents dumped through a sluice and 6-inch rubber hose into the filter tanks. The barrel is immediately recharged and set in motion, when the workman proceeds to filter. The cap of the tank is fastened on, and compressed air and water are allowed to enter the barrel, until a test of the filtrate with ferrous sulphate solution shows no gold is present, or, in other words, that the filtration is finished. The air is shut off, the tank is filled with water, the cap removed and the tank inverted, the contents dropping into a tailing sluice leading to the dump. This method of filtering is very simple and satisfactory, and to us appears to have many advantages over sand filters in cost and time of operation. The total time consumed in filtering a charge is an hour. If necessary, it could be done in thirty minutes, by using greater pressure. The solution leaves the barrel as clear as crystal—the wear and tear on the cloth is very light. If properly put in, it will last at least six months. The gain by not having these sand filters to each barrel, three or four hours' time consumed in filtering and then removing the tailings by shoveling, tramming, etc., is obvious.

There are two chlorinating barrels, and one filter for each barrel. Four charges—two to each barrel—are made every twelve hours, one man only being employed to each shift. Six charges every twelve hours, or the full capacity of the plant, could be made as easily as four. The filtered solution flows through lead pipes into three storage tanks on the floor below. These tanks are of steel, lined with six-pound lead, and are 6 feet in diameter by 8 feet high. The solution is drawn off from a tap, 6 inches above the bottom, thus allowing space for the collection of any slimes that may pass the filter cloth.

On the next floor below are the filtering tanks, twelve in number, 7x7 feet square by 4 feet high. They are built of 2-inch plank, tongued and grooved, braced by 4x6-inch timbers, bolted together with ⅝-inch rods. All seams are tightly caulked and the whole tank painted with P. & B. paraffine acid-proof paint. This style of tank was used in preference to the usual redwood tanks, owing to the heavy cost of bringing the latter a hundred miles from the railroad. They have given much satisfaction, the loss in leakage having been very slight, and if the caulking is looked after and the seams painted from time to time, such tanks should last a long time. Except the precipitating tanks, all other appliances are of lead or lead-lined.

The method of precipitation is as follows: The solution is run from the storage tanks into a launder running over the precipitating tanks, provided with a gate and outlet for each tank. When a tank is full, eight to ten buckets of sulphate of iron solution is added. The contents are thoroughly stirred, allowed to stand for thirty minutes, when a test is made in a porcelain dish with a little sulphate solution, to see if the gold is all precipitated. If not, more of the precipitant is added. If precipitation

is complete, the tank is allowed to stand for three days, when all of the gold will be settled on the bottom of the tank. The supernatant liquor is then drawn off through two lead taps provided for that purpose, one 12 inches from the bottom, the other about an inch from it. The tank is again filled with solution, precipitated, allowed to settle, and so on until it is desired to clean up. When the tank has been drained down through the last tap the settled gold, liquor, etc., are swept out through a special tap in the bottom of the tank, into a pail. The contents of all the tanks are poured into a smaller one, 2x2x4 feet, and allowed to settle for a few hours; the liquor is carefully siphoned off and returned to the precipitating tanks. The gold remains as a thick, brown mud, which is scooped into pans, carefully and thoroughly dried, mixed with bicarbonate of soda, borax glass and silica, and melted in graphite crucibles. The resulting bars run from 980 to 995 fine.

Filtering and washing the precipitate may be dispensed with if sufficient time for settling is allowed when the mass is in the cleanup tank. Much time is thereby saved, the cleaning up of twelve tanks, containing $7000 or $8000, having been accomplished in twelve hours. When the precipitate is filtered and washed the bars run over 990 fine; when this is not done the average fineness is 980.

In all cases it is advisable to allow the liquor withdrawn from the precipitating tanks to drain through a sawdust or sand filter, as a precaution that no gold left in suspension may be left. Great care must be taken to always keep the chloride of lime in a cool, dry place. If it becomes damp it is almost useless, and causes much trouble and annoyance.

The proportion of chemicals used is nine pounds of chloride of lime and eleven to twelve pounds of sulphuric acid per ton of ore. The average extraction of the values in the concentrates has been 95 per cent since the starting of the plant.

The superintendence of the operation should only be left in the hands of a man trained in the chemistry of the process. Many things occur upsetting the line of procedure laid down by an installing engineer, that are really simple and easily remedied, but puzzling to the ordinary mill man.

There is no doubt that the applicability of the chlorination process to many ores and classes of concentrates is constantly becoming better known, and its use will be extended, especially when it is more universally understood that such plants as described are built only to save cost of working in treating comparatively large quantities of material. Small mills can be erected very cheaply, built entirely out of common lumber; furnaces may be constructed out of rock, stones, etc., which will answer the purpose very well indeed.

A comparison of working costs of this method of chlorination with the Plattner process, as now carried out, may be of interest:

2 Turret roaster men at $3	$ 6 00
4 Reverberatory roaster men at $3	12 00
6 Cords of wood at $2.25	13 50
2 Barrel men at $3	6 00
1 Tank room man at $3	3 00
90 Pounds of chloride of lime at .05	4 50
110 Pounds of sulphuric acid at .04	4 40
Wear and tear, repairs, oil, etc.	5 00
Total	$54 50

40.54÷12=4.54.

Figured on twelve tons of concentrates per twenty-four hours, equivalent to ten tons of roasted ore, the cost per ton is seen to be less than $5. The average cost of chlorinating a ton of sulphurets throughout California and Alaska is given in the latest reports at $8.

The New Forest Reservations.

Written for the MINING AND SCIENTIFIC PRESS by JOHN MUIR.

Uncle Sam is trying to save his forests—what is left of them—and at the same time trying to find out how best they can be put to use and kept in use forever for the benefit of miners, farmers, lumbermen and the people in general. But the problem, though simple looking enough in theory, is a very difficult one on account of widely varying conditions and interests, and the general apathy and blindness of those whose interests are not immediately involved. In the meantime the demands made on the forests for timber grow heavier every year, while the area of the forest lands is rapidly being diminished and all kinds of waste and destruction go on, not only unchecked but with accelerated speed.

Running fires consume probably from five to ten times as much timber as the axe, even under present wasteful methods of lumbering, and as new settlements are made and the woods are more generally invaded these fires, of course, become more frequent and destructive. It needs no prophet, therefore, to see that unless protective measures be speedily invented and applied our magnificent forests, once thought inexhaustible and as little in need of protection as the ocean, will in a few decades be utterly destroyed.

On the Atlantic slope and in the middle West much of the land was cleared for farms, the soil being fertile, and bread, rather than timber, being required; but very little of the remaining forest lands are fit for agriculture, and when cleared become desolate and give rise to floods. At present most of the forest-bearing lands still belonging to the United States are in the great mountain chains of the West. Some of these, on the Coast ranges facing the ocean, are comparatively free from fire on account of copious rainfall, but the Rocky mountain region is dry and is swept every summer by tremendous fires. The timber is inferior, but of vast importance, nevertheless, covering, as it does, the fountains of our great rivers and supplying the mines of this rich mineral region and the farms in the adjacent lowlands.

Every interest demands a new departure in the Government's management of its forest property. As Mr. E. A. Bowers, formerly inspector of public lands, well says, "the time is ripe for the introduction of some intelligent policy. Some of the very men who have been the devastators of our finest forests begin to see the folly of their course, and fear that soon there will be no material for the lumber trade. They are ready and willing to pay the Government a reasonable price for timber which can be properly sold, and aver that some system by which they can cut timber under authority of law is a necessity. The more intelligent pioneers of the arid regions realize that the regular flow of the streams throughout the whole season, furnishing water for irrigation through the summer drouth, is changing into torrents of a few weeks' duration in the spring which carry destruction by their flood and wash away the fertile soil, and then suddenly subside and disappear when most needed."

Thus settlers, lumbermen and miners alike call out for reform, and the reform required is now being earnestly and thoroughly studied by the Forestry Commission appointed by the National Academy of Sciences at the request of the Secretary of the Interior. Under skilled management, something like what obtains in European countries, a perennial harvest of timber may be drawn from the woods sufficient for every need, and to spare, without diminishing their area, leaving them as beautiful as before, and as fruitful, with all their beneficent influences of every kind unimpaired.

As a foundation for such a system, it was at once seen that all the forest-bearing lands not more valuable for agriculture than for timber should be withdrawn from sale and held together by the Government in the public domain. Accordingly, as a preliminary step, on the recommendation of the Commission, twenty-one million acres in the West were reserved, in addition to some seventeen million acres formerly reserved by Presidents Harrison and Cleveland.

Then out of the West, the very region most to be benefited by a rational policy, came a storm of objection and protest. "All the resources of our States are being withdrawn from use;" "All our forests are to be made into pleasure grounds for wild animals and dawdling sentimentalists," they cried. They then claimed that all settlers were to be ejected from the reservations; that no search for minerals would be allowed, etc., which, being interpreted, is, "Let good old ruin go on and a few quick dollars be caught." If this were the voice of the people, the fair expression of public opinion, then good-bye forests. But we are far from believing it is. This sort of protestant seldom speaks in his own name, but usually in the name of his poor neighbor, while the great corporation and the free grabbers in general are kept out of sight in the background. One person with a thousand dollars directly at stake will complain more and fight more on a public question like this than a thousand men whose interests are only indirect and out of sight.

But things refuse to be mismanaged long. Light is beginning to bring the question into a fair view, and the policy of use without destruction and fair play to all must win at last.

GOODRICH SANDSTONE QUARRY, SANTA CLARA COUNTY.

Simple Ore Tests.

The following simple tests will show whether an ore carries any precious metals. Afterwards samples of the rock should be assayed to ascertain the amount of value per ton:

Gold—Powder; roast if sulphurets are present; grind very fine and wash in pan or spoon; examine with lens; yellow particles not soluable in nitric acid. The color of pure gold is bright yellow, tinged with red. Gold may be distinguished from all other metals or alloys by the following simple traits: It is yellow, malleable, not acted upon by nitric acid.

Silver—Pure silver is the brightest of metals, of a beautiful white color and rich luster.

Chloride of Silver—If suspected in a pulp, harshly rub a bright and wet copper cartridge thereon. If a chloride or chloride-bromide of silver, it will whiten the copper. Graphite will thus whiten copper or gold but can be rubbed off.

Copper—After roasting the pulp, intimately mix and well knead with a like quantity of salt and candle grease or any other fat, and cast into the fire when the characteristic colors—first blue, then green—will appear. This test is better made at night.

Galena—Black zinc blend is often mistaken for galena. The two may be distinguished by the infallible sign: the powder of galena is black; that of blende, brown or yellow.

Scientific Progress.

Rising and Lowering Continents.

The rapid rise of the land about Hudson bay is said to be the most remarkable gradual upheaval of an extensive region ever known. Driftwood covered beaches are now 20 to 50 or 70 feet above the water, new islands have appeared and many channels and all the old harbors have become too shallow for ships. At the present rate, this shallow bay will disappear in a few centuries, adding a vast area of dry land or salt marsh to British territory in America.

The erosion of the earth's exposed portions assumes rather serious importance when we are told, as in Dr. John Murray's latest lecture, that the continents will entirely disappear in about 6000 years if the present rate of washing away continues. The average height of the continents above sea level is now about 275 feet. The average depth of the sea is something like 13,000 feet, and its volume is so great that, if all the land of the continents were leveled off, the earth's surface would be an unbroken ocean two miles deep. The greatest ocean depth yet found is 5155 fathoms in the Pacific, off the Kermadec islands. The continental deposit of mud does not extend outward beyond a depth of 100 fathoms, and all is contained within a distance of 300 miles, this great mud belt being the feeding ground of the ocean. It seems almost certain that sunlight does not penetrate beyond about 100 fathoms—a belief confirmed by the total absence of plants at greater depths. There are no currents and very little motion of the water below 100 fathoms, all being blackness and stillness—an abyss of gloom appalling to the imagination. The darkness is relieved only by the phosphorescent lamps of the strange organisms which live at the bottom and feed on the organic particles precipitated from the upper waters. A feature of the deep-sea fish is that they contain very little bony substance or carbonate of lime. Dr. Murray thinks that life gradually found its way into the ocean from the continents, and that the farther away from land it got the more archaic it became in form.

The First English Armor Plate Rolling.

In a sketch of the life work of Sir John Brown, the eminent English iron and steel manufacturer, *The Engineer* gives the following account of the first armor plate rolling in England:

"It is Mr. Brown's custom to go on the continent every autumn. In 1860, on his way home, he returned by Toulon. There was no little commotion in the place that day. The French ship La Gloire had put into the harbor. This ship was a wooden 90-gun three-decker. The French had cut her down into a sort of magnified corvette, armed her with forty heavy guns, and clothed her with hammered iron armor 4½ inches thick; the plates were each five feet long and two feet wide. This 'new departure' in men-of-war put our admiralty in a fever. Ten 90-gun and 100-gun timber-built ships were at once stopped in their construction, the intention being to make them so many British editions to the French craft. Sir John tried to get on board the ship. He was not allowed. Inspecting the vessel very closely through his glasses, his quick eye detected that the hammered armor had a cobbled look, rough, like a rubble wall. He felt sure he could do better than that. Convinced that he could roll a plate superior to anything that could be hammered, he went back to Sheffield and set to work. He put down a rolling mill, and experimented incessantly until he achieved his purpose. At a meeting of the Institution of Mechanical Engineers, Sir John read a paper, in which he gave a description of the method of rolling a five-ton armor plate. As the first authoritative account of armor-plate rolling in England, an extract is worth preserving. Here it is: Several bars of iron were rolled twelve inches broad by one inch thick and were cut thirty inches long. Five of these bars were piled and rolled down to another slab, and these two slabs were then welded and rolled down to a plate 1½ inches thick, which was sheared to four-feet square. Four plates like that one were then piled and rolled down to one plate, measuring eight by four feet and two inches thick. Lastly, four of these were piled and rolled to form the final and entire plate. There were thus welded together sixteen thicknesses of plate, each of which was originally one inch thick, to form one plate 4½ inches thick, being a reduction of thirty-five times in thickness, and in the operation from 3500 to 4000 square feet of surface had to be perfectly welded by the process of rolling. Even with the greatest care it was not surprising that blisters and imperfect welding should occur and render the plate defective. This was the chief difficulty to be overcome, and it increased with the magnitude and weight of the plate, the final operation of welding the four plates, measuring eight by four feet and 2½ inches thick, being a very critical one. The intensity of the heat thrown off was almost unendurable, and the loss of a few moments in the conveyance of the pile from the furnace to the rolls would be fatal to success."

Earthquake Knowledge.

Earthquake science, which attracts little attention in the United States, has made great strides during the last few years. Prof. John Milne observes that only very recently an earthquake was looked upon as a transient phenomenon lasting a few seconds, or at most two or three minutes, while now, by the aid of the seismograph, it is possible to discover and record all the tremors preliminary to and following an earthquake. From his residence in the Isle of Wight, Prof. Milne was last year able to take records of two of the most destructive earthquakes in Japan, and in one case to predict that the occurrence of an earthquake at a certain time in Japan would be reported, the only inaccuracy in his prediction proving to be an error of one minute in time. The earthquakes now recorded in Japan, which is pre-eminently the land of such phenomena, now exceed 1000 a year. Seismology is being taken up in that country with great eagerness, making it certain that earthquake study throughout the world will be revolutionized very soon, and the Japanese have already profited by the work done to the extent of entirely altering the character of their buildings, and thus greatly reducing the loss from earthquakes. A committee of the British Association for the Advancement of Science is seeking co-operation in an effort to extend and systematize the observation of earth movements.

A MARVEL of geology that has remained strangely unknown is possessed by Greece at Argostoli, in the island of Cephalonia. At this point four currents of water set in from the sea and sink into the limestone of the cliffs, giving an anomalous water power that in the middle of the century was used for driving two grist mills. The fall from sea level to the surface of the discharge pits is 3 feet to 5 feet. Allowing a flow of 2000 cubic feet per minute to be necessary to drive the mills, Profs. F. W. and W. O. Crosby find that the annual consumption of water must have been 2,000,000,000 cubic feet, which would fill a chamber about five miles long, 1000 feet wide and 75 feet deep. As the flow seems to have been uninterrupted and fairly uniform for a century, perhaps for many centuries, it cannot be assumed that the water is simply filling a fissure. Other theories—such as evaporation in the porous rock or on encountering volcanic fires—are also unsatisfactory, and Profs. Crosby have reached the new conclusion that the water returns to the surface after being heated, the difference in density between the cold water entering the underground channel and the warm water emerging being sufficient to account for a difference in height that would enable the warm column to empty into the sea while the cold column is depressed below sea level.

Heat of the Sun.

Estimates of the sun's temperature have ranged from 18,000,000,000 degrees down to 3000 degrees Fahr. At the Moscow observatory, Prof. Ceraski has repeated the old experiment of measuring the heat of direct sunlight at the focus of a mirror, the mirror in this case being very accurately made and having a focal length of about 39 inches. The result was 3500 degrees C. (6300 degrees Fahr.), showing only that the solar temperature is greater than this. A measurement of the heat reflected from an arc lamp was then made, the temperature in the focus of the mirror proving to be only 100 degrees to 150 degrees C., although the arc itself was known to have a temperature of very nearly 3500 degrees. From this it is argued that the temperature of the sun must be very much more than 3500 degrees, while it is believed that this method may lead to an accurate estimate.

Electrical Progress.

Instruments for Fine Measurements.

In electrical work minuteness of measurement has been obtained. At the recent New York Electrical Exposition a meter was shown which would measure a current of 88,000 amperes. Lord Kelvin devised an instrument, which, as now perfected, will measure a current of one fifty-four millionths of an ampere; and such a current as is formed by dipping the tip of a brass pin and of a steel needle, connected with the galvanometer, into a drop of salt water, will cause the needle to swing clear across the scale. The radio-micrometer constructed by Prof. Vernon Boys, is so delicate that it will detect and register the rise of temperature through one-millionth of a degree. This extraordinary device will measure the radiant heat given off by a candle flame two miles away! It is merely a loop of wire suspended by a delicate quartz fiber between the poles of a magnet, the circuit being closed by a piece of antimony and a piece of bismuth soldered to a minute disc of copper foil. Similar instruments have been constructed to measure a microvolt ($\frac{1}{1000}$ of a volt) and the resistance of the one-millionth of an ohm. A mile of No. 10 copper wire has a resistance of about an ohm.

The figures and comparisons convey no very vivid idea of the micro-cosmic world into which they penetrate. By means of defraction gradings, that is, fine lines ruled upon glass—and it is possible to rule these as high as 120,000 lines to the inch—fractional wave lengths so infinitesimal that 2,500,000 of them laid alongside of each other would only make an inch, can be detected. Supposing that it were possible to draw out the little gold dollar of our currency into a wire one-twenty-five-hundred-millionth of an inch in diameter (one-two-and-a-half-billionths), that wire would be long enough to stretch to the sun and back again 10,000 times.

Reaching to such an extreme degree of tenuity, it would seem as if the groping physicist might be somewhere near the fundamental mystery of the constitution of atoms and molecules; and yet that mystery would be still locked in every infinitesimal portion of this minute wire.

Polarization of Electric Rays.

Prof. J. Chunder Bose of Calcutta recently lectured before the Royal Institution in London on "The Polarization of the Electric Ray." He described the apparatus designed by himself for experimenting with electric waves, by means of which, he said, experiments in electric radiation could be carried on with as much certainty as could experiments with ordinary light. He performed experiments illustrating the number of properties possessed in common by light waves and electric waves. He exhibited the power of selective absorption to electric rays displayed by many substances, pointing out that while water, for example, which was a conductor, stopped them, liquid air, which was a bad conductor, was quite transparent to them. He showed that various crystals could polarize electric rays just as they did ordinary light, and proved that substances under pressure and strain could produce double refraction in them as did glass under the same conditions in light. Tourmaline, he said, was useless for electric rays, but a lock of human hair was extraordinarily efficient, and ordinary jute formed a good polarizer.

Magnetism and Light.

Zeeman, of Amsterdam, has recently discovered a curious influence exercised by the magnetic field upon the period of light emitted by a flame. He introduced into an oxyhydrogen flame, placed between the poles of a Ruhmkorff's electro-magnet, a filament of asbestos soaked in common salt. The light of the flame was examined with a Rowland's grating. Whenever the circuit was closed, both D lines were seen to widen. To eliminate possible sources of error in this experiment, another experiment was made by heating sodium strongly in a tube of biscuit porcelain, closed at both ends, by plane parallel glass plates. The tube was placed horizontally between the poles of the magnet, at right angles to the lines of force. The light of an arc lamp was sent through. The absorption spectrum showed both D lines. Excitation of the magnet caused immediate widening of the lines. It thus appears very probable that the period of sodium light is altered in the magnetic field.

Zeeman considers that the true explanation of these results is afforded by the theory of electrical phenomena propounded by Prof. Lorentz. According to this theory, there are in all bodies small molecular elements charged with electricity, and all electrical processes are to be referred to the equilibrium or motion of these "ions." Zeeman considers that in the magnetic field the forces directly acting upon the ions suffice for the explanation of the phenomena. Prof. Lorentz, when consulted on this subject, predicted that the light from the edges of the widened lines would be found to be circularly polarized when looked at in the direction of the lines of force; and, further, that the magnitude of the effect would lead to the determination of the ratio of the electric charge which the ion carries to its mass. These predictions were verified by experiment.—London Electrical Review.

Compound and Shunt Wound Generators.

The successful operation of stations for electric lighting and power depends largely on the automatic regulation, not only of the speed of the prime movers, but also of the E. M. F. of the generators. In both of these essential features the last few years have brought forth marked development, in consequence of which we are now enabled to install plants for electric lighting and power, in which the speed of the engines will not vary more than 1½ per cent from the normal, when the full load is suddenly thrown on or off, while the builders of dynamo machinery can and do supply us with generators which are almost absolutely self-regulating as to E. M. F. A modern constant potential generator will not only compensate automatically for the variable losses due to armature reaction and internal resistance, but it can be made to give an E. M. F. at the brushes which, under varying conditions of load, will be such as to compensate not only for the variable losses in the machine itself, but also those due to the resistance of the external circuit.

The success which has thus been attained in the automatic regulation of

constant potential generators is largely due to the careful study and application of compound winding; and while but a few years since nearly all of the large stations were equipped with plain shunt-wound generators, we find that these have now been superseded by the compound-wound type in almost every class of service.—Journal Franklin Inst.

Mechanical Progress.

A Sidereal Clock.

The sidereal clock at the Greenwich Observatory is in an underground room called the magnetic basement, where it ticks its seconds as prescribed by the "clock" stars. This reference to the "clock stars"—fixed stars, slightly over two hundred in number, which are used in determining sidereal time, brings up the transit circle, the most important instrument in the observatory, and one of the most interesting. It consists of a large telescope, the outside of which is not unlike a great cannon, as it is of solid iron. It is supported by trunnions, which allow the telescope to be elevated or depressed, to point north or south, and to make a complete revolution, but never to diverge from the north and south line. The magnifying power of this instrument is not very great, but its field of view is large, so that it admits plenty of light, for it is not intended as a searcher after or for gazing at celestial objects, but for noting the exact time at which stars and planets pass south and north of Greenwich. Upon looking through this telescope is noted what seems to be a vertical row of iron bars placed at equal distances from each other. They are, however, spiders' webs, the center one, passing through the focus of the object glass, being the meridian line. By observing the time at which the "clock stars" pass over these web lines, or "wires" as they are called, is sidereal time regulated. The adjustment of the instrument has to be extremely exact in order to obviate error. The slightest thing will put it out, even so small a matter as too much sunshine.

On one occasion the correction for a level error in the instrument having become inconveniently large, owing, apparently, to a subsidence of the eastern support, about a ton weight of stone was placed on the western pier. But this having no effect, the stones were removed and a sheet of very thin paper was placed under the support on the eastern side, by which means the error was corrected.

To Shut Off Steam Instantly.

It sometimes happens in a large factory, run by steam power, that a man gets caught in the belting, some tool drops into a machine, a shaft is broken, or some other accident happens which renders the instant stoppage of the engine desirable. In the few minutes required to pass the word along to the engineer a life may be lost, or machinery may be damaged to the extent of hundreds, perhaps thousands, of dollars. To cope with situations like this a device has been invented to be attached to the engine itself, but actuated instantly by an electric wire from any part of the building. At various convenient stations the wire is provided with a button, like those commonly used on electric call bells. So long as the buttons are let alone, nothing will happen, but if any one of them be pressed for the tenth part of a second, that operation will immediately shut off steam. The current in the wire, when the button is pressed, energizes an electro-magnet on the engine, and the attractive power of the magnet throws up the arms of the governor and shuts the valve admitting steam to the engine. This electric apparatus can also be made to work automatically with a slight increase of speed in the engine, and thus prevent racing, bursting of flywheels and other mishaps. The *Tribune* says the invention has been fully tested, and is now about to be manufactured for the market in Springfield, Mass.

THERE have been built in the United States in 1896 33,000 cars more than the total of two years ago, yet the total is still below the lowest of any year before 1894, for which we have figures that are comparable. These go back to 1888, and the lowest total in that period is in 1893, when 56,900 cars were reported built, or about 6000 more than in 1896. But one of the large companies, whose output is included this year, did not report in 1893, so that the difference is actually larger. Comparing with 1890, the best year for car building in the last decade (the best for locomotive builders also), we find that the 1896 output was not half that of the earlier year, when 103,000 cars were built. In both 1891 and 1892 also the contracting shops turned out within 4000 of 100,000 cars.

HAMMERS are represented on the monuments of Egypt, twenty centuries before our era. They greatly resembled the hammers now in use, save that there were no claws on the back for the extraction of nails. The first hammer was undoubtedly a stone held in the hand. Claw hammers were invented some time during the Middle Ages. Illuminated manuscripts of the eleventh century represent carpenters with claw hammers. Hammers are of all sizes, from the dainty instruments used by the jeweler, which weigh less than half an ounce, to the gigantic fifty-ton hammer of ship-building establishments, some of which weigh as much as fifty tons and have a falling force of from ninety to one hundred. Every trade has its own hammer and its own way of using it.

IN England much attention is given to shorthand, especially for reports for newspapers. It is quite the rule that every man connected with a newspaper, as an editor or reporter is a trained writer of shorthand, an accomplishment made necessary by the practice of printing very full reports of speeches delivered in Parliament or on the platform. It has not yet come into anything like universal use, as with us, for business correspondence, but is growing into popularity since the typewriting machine began to make its way; neither is it employed in courts of law for taking verbatim reports of testimony, this duty being still assumed by the judge, in accordance with old-time usage.

R. T. PAINE, of Boston, on March 9th, on a train on the Philadelphia, Wilmington and Baltimore Railroad, broke all previous records between Washington and Wilmington. Mr. Paine's wife was dying in Boston, and Mr. Paine chartered the train in Washington at $2 per minute, and offered a bonus for every minute clipped off the record. The distance between Washington and Philadelphia is 135 miles, and it was covered in 132 minutes. Two three-minute stops were made to cool journals. It took the train but 30 minutes to make the 34 miles between Perryville and Wilmington.

IN the trial of the compressed air motors on 125th Street line in New York, the cars have made regular daily trips for nearly eight months, have successfully completed a total mileage of 23,183 miles, and carried about 138,650 passengers. An accurate account has been taken of the daily consumption of air, as well as the consumption during each trip, and the motors have demonstrated, not alone their practicability, but also their economy.

THE longest turntable in the world was completed recently at East Albany for the New York Central. It is intended not only for locomotives, but for sleeping and long private cars. It is 68½ feet in length, and its construction required 431 yards of concrete in the center of the table. As evidence of how nicely it is adjusted, a boy fourteen years of age turned one of the company's heaviest locomotives on it with but little effort, so perfect is its mechanical adjustment.

Practical Information.

Economic Value of Fruit Stones.

The seeds or stones of many fruits which would apparently seem useless have some economic value, and in this connection we are speaking chiefly of those which are often thrown away. In certain parts of Egypt the date stones are boiled to soften them, and the camels and cattle are fed upon them. They are calcined by the Chinese, and enter into the composition of their Indian ink. In Spain they are burnt and powdered for dentifrice, and vegetable ivory nuts are applied to the same purposes. Some species of Attalea nuts are burned in Brazil to blacken the raw caoutchouc or india-rubber. The seed or stone of the tamarind is sometimes prescribed in India in cases of dysentery as a tonic, and in the form of an electuary. In times of scarcity the natives eat them after being roasted and soaked for a few hours in water; the dark outer skin comes off, and they are then boiled or fried. An oil has been obtained from this seed. The seed of the carob bean is ground up as food for cattle, and is used in Algeria, when roasted, as coffee.

THE new Panama Canal Company, which is now said to be quietly but steadily working upon the construction of a lock canal, was organized in Paris on October 1, 1894, just in time to save the concession from Colombia, which expired on October 31, 1894. Stockholders subscribed $4,000,000 toward the work, and from some of the thieving promoters of the old company a further sum of $3,400,000 was forced. The report of the Commission of Dutch, Belgian and French engineers, submitted in May, 1890, estimates that a lock canal could be built for $180,000,000, including interest on the investment and 20 per cent for contingencies. The estimated traffic was 1,000,000 tons for the first year and 6,000,000 tons twelve years after the opening of the canal. The latter amount would yield $12,250,000 annually in net tolls, which would be about 25 per cent higher than the tolls on the Suez canal. The estimated value of work done and plant on hand was $90,000,000. The United States of Colombia has granted a further concession extending the time of completion to 1904. Under the present administration it is claimed that the strictest economy is being practiced and the latest devices for cheaply handling earth and rock are being introduced.

THREE useful things to have in the house as a provision in case of wounds not sufficiently serious to necessitate a doctor, are a spool of adhesive plaster, some iodoform gauze and a package of carbolated absorbent cotton. Cleanse and dry as nearly as may be the cut surface with a wad of the cotton, using moderate pressure, and elevating the part if necessary to check the flow of blood. Do not apply any water. Bring the cut surfaces together as accurately as possible and retain them there with as few and as narrow strips of the plaster as will suffice, cutting them of a good length. Then cover the wound with a dozen or so thicknesses of the iodoform gauze, which should extend an inch beyond the wound. Over the gauze apply a liberal layer of the absorbent cotton, allowing it to extend beyond the gauze. The cotton may be kept in place by a bandage, or a part of the leg of a stocking may be drawn over it. Moderate pressure, if evenly distributed, is helpful. The pressure of a string is hurtful. Keep the part moderately elevated and take care that there is no constriction of the limb above the wound.

RUSSIA has under consideration the establishment of a gigantic waterway from India to St. Petersburg. From the confines of Afghanistan, this route would pass by the Amou Darya, and across the Caspian sea to reach, by way of the Volga and the Marie river system, the capital and the Baltic. The whole project depends on the possibility of diverting anew the waters of the Amou Darya in their ancient bed, leading to the Caspian. After the occupation of Krasnovodsk in 1869, and the capture of Khiva in 1873, a number of expeditions were sent into the Turcoman Steppes to examine the ancient beds of the Amou Darya. After Lieut. General A. Glonkhovskoi's five years of unceasing labor, the expedition reported in favor of the restoration of the ancient bed of the majestic Amou Darya, which would restore their ancient fertility to the oases of the country, and, by re-establishing the irrigation of the Turcoman Steppes, would procure for the whole region abundant crops. The establishing an unbroken river route from the Baltic to Afghanistan would open up to Russia at the same time the markets of India, which are up to the present inaccessible, and would assure for the whole world the shortest road, by the Caspian sea and Russia, by which the commerce between the richest country of Asia and the States of Europe would largely benefit. Last August a new expedition under the same direction was sent, on the initiative of the Government, to the valley of the Amou Darya, with the object of ascertaining what changes had taken place in the course of the river since 1884, and also in its minor channels, so that the new question of the best direction for the course of the river might be settled.

THE practice of woman changing her name on marriage originated from a Roman custom and came into use after the Roman occupation. Thus, Julia and Octavia, married to Pompey and Cicero, were called by the Romans Julia of Pompey, Octavia of Cicero, and in later times women in most countries signed their names in the same way, but omitted the "of." Many persons think that the custom originated from the Scriptural teaching that husband and wife are one. This was the rule of law so far back as Bracton, and it was decided in the case of Bon vs. Smith in the reign of Elizabeth that a woman by marriage loses her former name, and legally receives the name of her husband. The custom, however, is not universal. In Spain and Portugal married women do not take the names of their husbands, but continue to be known by their own. In many parts of the United States a woman never relinquishes her maiden name, and is called by it as often as by that of her husband. Even in the rural parts of England one often finds a married woman called by her maiden name, and in country districts of Scotland it is sometimes found that both names are used. In many parts of France and Belgium the husband's and wife's names are used together when either of them is used.

TO ASCERTAIN whether or not a room is damp, a pound of fresh lime should be placed therein, after hermetically closing doors and windows. In twenty-four hours it should be weighed, and if the pound has absorbed more than 1 per cent of water, the room should be considered damp and classed as unhealthy. The question of the dampness of dwellings is a frequent cause of dispute between landlord and tenant, and is naturally solved in the negative by the former. The question can be settled by the test of the hydration of lime, which will give irrefutable proof of the validity of such complaint.

GOOD sandpaper will not crack when folded double, and, when the sanded surfaces are rubbed together, an idea of the quality may be obtained by observing how readily the particles of sand are detached. Sandpaper should always be kept in a dry place. If the back of the paper is chalked, it will prevent its slipping when using.

THE Sahara is not a barren and worthless waste. Some time ago there were 9,000,000 sheep in the Algerian Sahara alone, besides 2,000,000 goats and 260,000 camels. On the oases there are 1,500,000 date palms.

Mining Summary.

CALIFORNIA.

Amador.

Republican: At the Anita at the depth of 500 feet drifts have been run on the ledge north and south. The south drift has followed the ore body for 80 feet from the shaft. The north drift is in ore for 200 feet. The length of the chute at this level is 250 feet, the width ranging from 3 to 8 feet. A portion of this ledge is high-grade ore. The average of the ledge in its entire length and width is estimated at $6 per ton.

At the Alma they have been running a drift east at the 1000-foot level to tap the ledge. The ore was penetrated some months ago by the diamond drill, the drillings showing a 6-foot ledge of good quality. The regular drift has been extended 100 feet from the shaft. In the early part of the week an abundance of water was tapped, indicating that the fissure is close by.

The McMahon, east of the Zeile, is being prospected under a bond secured by T. H. Rooney. Last week a quartz ledge was encountered at the depth of 100 feet.

The Oneida shaft is down over 800 feet and making rapid progress.

The new 40-stamp mill of the Baliol Mining Company, operating the old Maximilian mine, east of Sutter Creek, was started last week.

Ledger: A. Saullan, who has been prospecting on the property west of the Alma, intends to reopen the incline and sink 100 feet this spring.

The Union Consolidated will prospect their ledges at the 500-foot level. They propose to run east to the gouge ledge, about 130 feet, and west to the Paugh, about 600 feet.

J. F. Parks, representing the company operating the Kennedy, has been trying to get a four-year bond on the Good Hope mine, and to pay $75,000 therefor if it should prove to be a profitable investment after development work has been done. The principal owner, Mr. Peters, refuses to accept the proposition. The work of sinking has been resumed.

Record: Ore is being hauled from the Argonaut to the Zeile mill. Grading is being done for a 40-stamp mill, which will be erected as soon as the weather settles.

The Bay State mine in Plymouth district suspended operations a couple of weeks ago. It is understood to be the intention to resume work again in a short time.

Butte.

Mercury: At Forbestown Mr. Antram has put his mining property into the hands of the Pacific Mining Improvement Company for development. They have a 12-foot ledge, the ore low grade, but it is proposed to build a 100-stamp mill.

Charles Webb Howard of San Francisco, who has had a bond on the Dannebroge and and Pennsylvania mines in Brown's valley, has complied with the conditions of the bond, and is now the real owner of those claims. The consideration was $35,000 for the Dannebroge and $4000 for the Pennsylvania. N. D. Rideout was the seller of the Dannebroge. F. W. Page is Mr. Howard's general manager.

El Dorado.

(Special Correspondence). — San Francisco parties have purchased 160 acres of gravel property upon which a mill is to be erected within a short time; active work will be commenced in a few weeks. The property is within five miles of town.

At the Union mine the work of running a tunnel is progressing rapidly. The distance run is 250 feet. It is expected that the ledge will be cut at another 250 feet. The property is a portion of the old Church Union, eleven miles southwest of town, and is operated by Judge George E. Williams.

At the Omo mine, twenty-five miles east of Placerville, one tunnel has reached 140 feet, and a lower one has reached 300 feet, both on a 6-foot ledge of $10 ore. A 5-stamp mill is just completed and within a few weeks the plant will be in full operation.

New life is coming into the famous Indian Diggings gravel mines which were rich producers during the days of hydraulic mining. Men are working the tailings through sluices and netting from $3 to $5 per day.

Placerville, March 30th, '97.

Fresno.

Republican: Several new prospects on Kings river, in the vicinity of Trimmer's Springs, are reported. Among the most promising is the Bowers lead, which is reported to have been bonded for a large sum recently. A number of other prospects also promise well. Great interest is being taken by the prospectors, and it is believed that the attention of capital will soon be attracted to that locality. The ledges are all very large.

Inyo.

Register: At Darwin work is still progressing at the Lane mine, now owned by the Inyo County Mining and Development Company. The force has been increased to fourteen men. The new shaft is down nearly 600 feet, with plenty of high-grade ore in sight, enough being taken out to keep a team hauling on an average of fifteen tons to the trip each four days. Besides which the company is doing a lot of dead work, and have two men employed opening up the Lane Spring, in the Darwin Wash.

The Bryan mill, at Montgomery Bros.' camp, was started last week. About twenty-five men are employed at the camp.

Hannaberry & Kern speak of putting up a mill on their claims in Jail canyon.

Panamint district seems to be having a big boom, as the roads between Panamint and Randsburg are lined with teams. New towns are also springing up, one being laid out at Post Office Springs, and one with the handle of Ballarat, a mile and a half north of Post Office, has one hundred inhabitants.

Kern.

Californian: There is decided interest in and about Havilah, in the mines. Several are being developed which show flattering results. Keysville is having a small boom of late. The mines there are turning out good ore.

From all indications Piute mountain will have a boom. There are large, well-defined ledges, and many minor ledges from 1 to 3 feet, that bear very rich quartz, and the miners are patiently waiting for the snow to disappear to resume work.

A stamp mill is to be built on the Surplus mine, there being sufficient ore in sight to keep a mill running for some time, and it is of a high grade.

The Amalie Mining Company are running their mill daily with good results.

H. W. Blaisdell is coming back to Havilah to resume operations in the mines there.

Kern and San Bernardino.

(Special Correspondence).—The activity in mining circles which has characterized the past year has not abated. At Virginia Dale, Randsburg, Kramer, Needles, Providence, Picacho and other points a great amount of businesslike development work is being done, and in each of the camps above mentioned there are from one to half a dozen mines that are paying very well. At Randsburg the town lot boom which held sway in the bustling camp a few weeks ago has entirely subsided, but there is no decrease in the number of inquiries for safe mining propositions. It is expected a large force will soon be put on to work the Rand group of mines, and Reddy, one of the owners, says a 20-stamp mill will soon be put in at the foot of the incline, five miles from the mines, where a water supply can be easily obtained. In this camp are many idle men, who came expecting to secure employment. There is a shortage of capital and an excess of workmen in all that section.

San Bernardino, March 29th, '97. G.

Nevada.

Transcript: The steam pump ordered for the Summit mine has arrived and is being placed in position with all possible haste. It will pump from the shaft at the rate of 400 gallons of water every minute, which with the other pump already at work will probably free the mine of water down to the 300 level in a week. The water has risen in the shaft 280 feet and was still rising. It is not known whether the water comes from a large underground waterway or is an indication that a big ledge of quartz is not far from where the body of water was tapped by the machine drills.

Union: In the California mine Supt. Dana Harmon has the tunnel now in 1640 feet and it is calculated to strike the vein when the tunnel is pushed ahead another 150 feet. This will give about 600 feet of backs, and will be the deepest working ever done in that section of the county.

Placer.

Sentinel: The New 5-stamp mill at the Mountain Maid quartz mine is now running day and night. This mine is located near You Bet. The main tunnel is in about 400 feet on the ledge. A crosscut has been made showing a width of 25 feet for the ledge without having either hanging or foot wall. At the end of the main tunnel they have 150 feet of backs. By sinking on the ledge to the level of Bear river the backs would be increased to 500 feet. The ledge contains streaks of high-grade ore, but as the entire ledge matter is run through the mill it makes a low-grade proposition. The rock is dark, almost what might be called a porphyry dike, and is such that two men in the tunnel more than keep a 5-stamp mill running.

The French Hill quartz mine in Spanish Dry Diggings district, near Butcher ranch, has been sold to J. H. Galey of Pittsburgh Pa., for $40,000. The mine was the property of State Printer A. J. Johnston, and the sale was negotiated by Col. W. R. Wallace of Auburn. Mr. Galey is a large stockholder in the Standard Oil Company. A 10-stamp mill is on the ground and a concentrator has arrived at Auburn. The ledge is about 40 feet in width and prospects well in free gold. The sulphurets are rich.

At a depth of 260 feet in the Occidental mine at Grizzly Flat gravel has been encountered. Supt. Wm. Cameron expects to reach bedrock by sinking the shaft 60 feet farther. The Occidental adjoins the Morning Star mine.

At the quartz mine on the old Brokaw place, east of Auburn, purchased from C. F. Reed by James E. and John T. Walsh, a perpendicular shaft is being sunk. Some weeks ago these gentlemen took nearly $1000 from a rich stringer.

One-half interest in the Bell Union mine has been sold for $4000 to P. A. Hart. The mine is owned principally by H. M. Bayne and is situated on the American river, near Auburn. The ledge is 4 feet thick and has been cut in many different places.

At Westville the Herman mine is working twenty-five men and is paying well, if not better than ever. Supt. O. L. Barton says as soon as the road can be opened the company will put in a compressor to run the new tunnel to tap the main ledge 400 feet lower. Everything looks favorable for putting ten more stamps in the mill this coming summer.

The Avalon gravel mine at New York canyon, east of Westville, is working seven men. Supt. Worden expects soon to strike through into gravel.

Supt. B. Denton of the Sailor Canyon gravel mine says that the mine has been bonded to a German syndicate in San Francisco for a large sum.

Italian Bar mining district bids fair to be a prosperous camp in the near future, as some eight or ten locations have been made in quartz this season, and all seem to show good prospects and can be opened with very little capital.

Hobson, Ward & Co. have closed down their mine until spring, when they will reopen on a larger scale.

There is beyond a doubt going to be a boom among the mines in this vicinity this summer, especially among quartz mines, as they seem to be more numerous than gravel.

Argus: At Blue Canyon the proprietors of the Van Avery mine are getting their new concentrator in place. Work in the tunnel will be taken up again as soon as the weather becomes more favorable.

Work in the Redstone mine still remains suspended on account of deep snow.

Plumas.

National-Bulletin: The Plumas Imperial mine has developed and is now working an immense bank of auriferous gravel. The bank is 100 feet high, 80 feet of which is excellent appearing channel wash, the remaining 20 feet being strata of pipe clay. The channel is about 1200 feet wide. Hydraulicking is proceeding steadily.

M. F. Peterson has returned to the Sunnyside on the North Fork, on which work will soon be resumed.

San Bernardino and Riverside.

(Special Correspondence).—In the Virginia Dale district, on the desert east of San Bernardino, there are perhaps 600 or 700 men in a region twelve by sixteen miles, and a great deal of quiet work is being done. Dale City, platted three weeks ago, is the business center, and already has a couple of stores, a saloon, blacksmith shop, postoffice, a wagon line to the railroad, etc. The town is located at the point heretofore known as Lyons Wells, and the site was chosen on account of the water supply the place afforded. The San Francisco company which lately acquired the old Virginia Dale mine at this place has erected a 40-ton mill, which was started up this week and is said to be working satisfactorily. This plant will be a great thing for the district, as it will do custom work most of the time. Development work hereabouts has been greatly retarded by the absence of milling facilities, but will go forward right well under the new order of things. The 2-stamp mill of the North Star Company started up again this week. For several months this company has been doing systematic development work and a short time ago an expert reported $120,000 worth of ore in sight. The Leoti mine is also paying handsomely. The district contains several other notable properties, which will be mentioned in a future letter.

At Twenty-nine Palms, on the desert east of San Bernardino, the Desert Mining and Milling Co., under the superintendency of Mr. Mudge, have erected a 10-stamp mill, which was billed to start up some time this week. The mines of this group contain a great deal of rebellious ore, and the same company is figuring on the erection of a cyanide plant with fifty tons daily capacity at an early day.

At the Iron Chief mine, forty miles northeast of Walters station, on the Southern Pacific, Beach, Moore, Stephens & Stewart have a great deal of high-grade ore on the dump. Shipments to the Selby smelter will be made shortly.

At the old Santa Rosa mine, near Perris, Riverside county, sixteen employes have sued the company for back wages in sums ranging from $50 to $200.

A large body of very rich ore has been opened up in the lower workings of the Green Lead mine at Holcomb Valley. The 10-stamp mill will be started up at once.

The old Good Hope mine, near Perris, Riverside county, cleaned up $11,000 last Saturday as the result of a two weeks' run. Under the management of Mr. Sigafus the property seems to be paying handsomely.

The late run of ore from the Alice mine, same district, gave good returns. G.

San Bernardino, March 30th, '97.

San Diego.

Union: At Julian the Helvetia has been idle, but work is expected to begin again this week.

Delgrove & Phillips are having fifty tons of ore hauled from the North Star mine to the Ready Relief mill.

Farley Bros. & Co. are sinking a shaft on their mine, the Gold Cup, in Banner. They are down 50 feet and are taking out good ore.

F. O. Potter has sold the Paddock mine to J. W. Brenning of San Diego.

Shasta.

Free Press: The success of the Mountain Copper Company is now assured. By the shipment of three and one-half cars of matte per day the output of the smelter will equal the cost of operating the great plant each day. With two furnaces in operation this output is easily acquired. Operations have been retarded by the work of developing the mine at Iron Mountain. The Mountain Copper Company have been running their No. 1 furnace steadily and on Wednesday completed the repairs on furnace No. 2 and started it running. Furnace No. 3 is well under way, but will not be ready for operation for some time. At this time nine train loads of ore are delivered at the roasting plant every twenty-four hours from the mine. The train is composed of ten cars of a capacity of eight tons each. The development of the mine shows that with the consumption of 3000 tons of ore each day there is sufficient ore in sight to last for twenty-five years. With an output of 3000 tons of ore per day from the mine it will be sufficient to supply ten furnaces of equal capacity of those now in operation.

Free Press: A rich strike was recently made in the Ballou mine on the south fork of Clear creek. The property belongs to E. L. Ballou, but is under bond to Senator John P. Jones of Nevada, who has been developing the property for several months past. The strike was made in the 350-foot level, or 150 feet below the old workings. A ledge of ore which runs from 2 to 3 feet in width was encountered.

C. G. Crowell, manager for the company who own the Mad Mule mine near Whiskytown, intends starting work upon a new tunnel upon the property.

The National Mining Company has just completed a mile of road around the hill to the Garfield mine, and the mill will soon be run by electric power.

Mr. Hill of the Mountain Copper Company holds a bond on the Balla Klallala or Windy Camp mines, on which he will soon commence development work.

At Copley an extension of the pipe line for Dr. W. H. Garlick will be built to increase the pressure at the electric power house near Bull's Bar, and power furnished the National Mining Company on Rich gulch.

Searchlight: The Mammoth mine of Old Diggings, owned principally by Samuel Scheney of San Francisco, will shortly resume operations on a large scale. Two hundred tons of ore are now on the dump.

A meeting of the leading mine owners of the Harrison gulch section was held in Red Bluff last week, among those present being Captain Roberts, J. W. Frank and others owning valuable interests. It was decided to incorporate as a mining company and withdraw the mines from the market. The company will organize with a capitalization of $800,000.

The Crown Point Consolidated Gold Milling and Mining Company completed its two ore dumps last week. The new road to the mine is completed, and shipping ore will commence at once.

John M. Pfeiffer last week sold his mine at Lower Springs for $1000 to E. W. Brackett and Wm. A. Spark.

Sierra.

The *Enterprise* learns that the company who have the control of the Bigelow mine, at Sierra City, intend erecting a large mill on the mine in the near future.

Siskiyou.

News: Doggett, Craig, Harbaugh and R. M. Walker are running a tunnel on the old Pioneer mine in Quartz Valley.

The Columbia mine on old Baldy is being worked night and day, about twenty-five men being employed in extracting ore, while the mill is kept running steadily.

Winsell, Clute & Neil, who have leased the Thompson mine on Hungry creek, are piping night and day on a 45-foot bank.

A. S. Smith, of San Francisco, has leased of Dave Horn a strip of ground on Cottonwood creek above Hornbrook, and is making preparations to prospect the old channel. He is now working a crew of some ten or twelve men and expects soon to be able to double the force.

The Belcher Placer Mining Company has been incorporated, with William Baptist, president, and W. J. Bennett secretary and treasurer. Their properties at present consist of nineteen claims or about 2000 acres of placer ground, some of which are in active operation at the present time. A large part of their property is located in the Salmon River country.

Reporter: At Scott Bar the Columbia is working over twenty men, and are taking out good ore. The 5-stamp mill is kept busy and it is reported that five stamps more will be added in the near future.

William Chamberlain will resume work on the Mabel mine as soon as his co-owner, Dr. A. J. Timmons, returns from the East. The Mabel is an extension of the Columbia.

At Nolton the Seattle Company's pipe is running day and night. They have eight men in their employ.

Below Happy Camp, the Kanaka Flat mines have been located by Dr. Gregory and Mr. Brown, with the water rights for working it.

At Milliken's Bar is a high bench or bar which J. Friedland Rolls & Co. have located, with water to work. They are now prospecting by drifting and getting excellent returns.

Trinity.

Redding *Searchlight:* On the Bloss & McCleary properties at Trinity Center the area of gold-bearing gravel is 1060 acres, comprising four channels on a succession of benches from the river to the top of the mountain. All these channels carry value, and the gravel in the upper one is 90 feet in depth. Gravel is being worked now with 2100 inches of water which is brought to the ground by two ditches, one six miles and the other three miles in length. The volume of water will be increased to almost 5000 inches during the present year, and a ditch and flume to open up the deposit from the river, about three-fourths of a mile in length, will also be added shortly. A fall of 600 feet can be utilized.

Redding *Free Press:* G. L. Carr, of Carrville, is operating an old discovery called the Blue Jacket. Upon the surface he found a ledge of ore which was 40 feet in width. He began a tunnel, which, when it strikes the ledge, will be 300 feet in length and will tap the ore body at a depth of 120 feet.

On the Forget-Me-Not mine Mr. Carr has run over 1000 feet of tunnels and has a ledge of ore 4 feet in width which will average $12 per ton, and which he has tapped at a depth of 200 feet.

Journal: On the La Grange ditch extension tunnel twenty-four men are working steadily and the tunnel is being driven ahead. As soon as the weather permits a force of men will be put on to complete the ditch to Stuart's Fork. There yet remain about eight miles of fluming to bring the water to the tunnel.

Bert Kellogg is running the arrastra on his mine on Kingsbury gulch on high-grade rock.

Hawksley & Mack are surveying a ditch from the Hay Fork creek to carry 2000 inches of water for mining and irrigating purposes.

The placer mines are working the usual

number of men with good results. On the Mountain View mine, owned by Pragmore & Duncan, the arrastra is running on good ore.

Tuolumne.

Union-Democrat: At the Rawhide the present force consists of 100 men but the number will be increased when the weather will permit fuel to be landed on the property to move some machinery which is at present idle. In the main shaft sinking has been resumed from the 1000 level and will be continued to the 1300. The exact depth attained up to date is 1050 feet. The ledge at this point carries a uniform width of 30 feet of well defined quartz.

On the App all the force possible has been concentrated at the 800, where crosscutting, drifting and stoping is being carried on. The ledge on this level where being stoped out shows 20 feet of well defined quartz.

On the Santa Ysabel sinking in shaft three still continues from the 600 level. Upraising on the Mascot vein is carried on toward the 100 crosscutting connection. Work on the new mill is very slow, owing to ordered material and supplies still being tied up at Oakdale.

At the Dutch crosscutting and drifting on ore body in the 300 level continues. On the 200 stoping in ore is being carried on.

At the Mt. Jefferson the main shaft is down 280 feet, and has been abandoned by J. N. Meighan, the manager, who has commenced the sinking of a new shaft. The vein is a strong one, and the ore assays high in free gold and sulphurets.

On the Wonder mine at Big Oak Flat a 5-stamp mill has been erected on the mine. It has an ore chute 10 feet in thickness and of unknown length on the north end, and another on the south end.

Considerable surface work has been done on the Gold Bug and an ore chute of both high and low grade has been developed and is known to extend not less than 400 feet in length.

The Accident, which joins the Longfellow on the north end, is owned by Wm. and Arthur James, and has from 9 to 12 feet of ore that will work $6 per ton in free gold.

The Longfellow mine is bonded by Dr. J. L. R. Roberts & Co. Some rich ore has been struck in an incline shaft about 100 feet south of the main shaft.

NEVADA.

Salt Lake *Tribune*: The April Fool is reported running along steadily, as is also the Magnolia, at which the recent strike was registered, and there is not an idle main in the camp.

Victor M. Clement is engaged in an examination of the De Lamar mine. The prevailing opinion is that the examination is in behalf of a foreign syndicate which has in view the purchase of the property, although there is a theory that the Captain has ordered the measurement that he may have definite knowledge of the value ef the ore bodies that are now blocked out. Should a sale take place, the figure will not be less than $3,000,000, as that amount was refused when Charles M. Rolker made the examination of the mine last season and recommended that his syndicate take it up at this figure. Meanwhile the new machinery that will largely increase the capacity of the mill is being put on the ground as rapidly as possible, and thirty days later over 8000 tons a month will be going through the plant.

OREGON.

Times: Carson & Son are running a drift in their placer mine on Oscar creek, Josephine county, and have reached a depth of 300 feet. They have struck an old channel and are taking out good pay,

A deal has been closed by the Ollala Mining Company for the purchase of a large area of ground on the Ollala river, Douglas county, and work will be pushed. Portland parties are interested.

The mines in Evans creek district are being run on full time with a good supply of water; also those on Pleasant creek.

The recent strike at the head of Pleasant creek is attracting considerable attention. Fourteen claims have already been located on the lode.

A. W. Sturgis of Forest creek made a partial cleanup a few days since, after a five weeks run. Nearly $2100 worth of gold dust was taken out.

The carload of quartz from the Taylor & Crow mine on Lost Flat, Josephine county, which was crushed at the Hicks mill at Ashland last week, yielded $2,500. There were thirteen tons of the ore. The carload crushed before produced nearly $3,000.

Courier: There are twelve men employed on the Horn-Silsby-Tucker placers on the Illinois river. Considerable work has been done on the new ditch, strengthening it against the snowfall in the mountains, but they will have water for working the year around.

The Hampton-Lewis placers on Upper Grave creek keep sixteen men busy. Extensive preparations have been going on at these mines for two years and now they are about ready to run six monitors steady. A race 1200 feet long has just been completed. It is paved with railroad iron to resist the cutting process of boulders.

Baker City *Democrat*: The shaft at the Virginia Consolidated mine lacks only a few feet of being down to the depth intended before crosscutting to the Virtue ledge 500 feet.

It is the intention of the owners of the Columbia mine to at once commence deep sinking. A vertical shaft 400 or 500 feet will be sunk.

The Bradbury Bros. have sold their property north of the Flagstaff mine to J. W. McCoy, manager of the Perry mine, for $8,000.

The Grant Mining Company will carry on placer mining operations in Granite district the coming season on a very extensive scale, having reservoirs and ditches of large capacity already constructed. It is expected the company will employ upwards of 100 men in its several claims.

The machinery necessary for the erection of the smelter at Quartzburg was shipped some time ago. The smelter will enable the miners of that district to realize a good value on ore from mines that otherwise would remain unprofitable.

Oregonian: In the Cracker district, in Baker county, in the Eureka and Excelsior mine a 20-stamp mill is working. The cost of mining and milling has been brought to a little less than $3 a ton. The plant handles about seventy tons of ore a day. The ore is not free milling, as the gold is in the sulphurets. The lode is from 20 to fully 200 feet in width; the milling ore runs from 2 to 15 feet in width.

On the North Pole the lode is tapped by two tunnels, the second being 400 feet lower than the first. The upper tunnel exposes an ore chute 600 feet long, with milling ore varying from 2 to 15 feet in winth. The plant on the mine consists of a 10-ton furnace; ten stamps, and a complete cyanide plant with a capacity of over twenty-five tons of ore a day.

WASHINGTON.

Spokesman-Review: On the Colville reservation many mines are being worked.

The Green Mining and Development Company has been formed in Walla Walla for the purpose of developing the Blue creek gold mines. The capital stock is placed at $1,000,000.

The Palmer mountain tunnel at Loomis is now in the mountain 230 feet. Inside of sixty days the machinery for the new air compressor will be in position, which will increase the weekly progress to about 40 feet.

The owners of the Kalamazoo group are still developing the rich copper-iron capping on the Johnny Bull, and the size of the ledge is not yet definitely ascertained.

BRITISH COLUMBIA.

Spokane *Chronicle*: From 1000 to 1200 men will find employment in the mines around Grand Forks this summer.

Judge Spanks has let a contract for a 50-foot shaft on the Grey Eagle.

The Olive Mining and Smelting Company, which owns the Volcanic on the North Fork of Kettle river, will start work about April 15th, with a large force of men. The company already has a tunnel in 350 feet and several shafts from 10 to 20 feet deep. It is the intention to erect a smelter as soon as sufficient development work is done.

The final payment has been made on the Mother Lode claim in Deadwood camp. The total sum paid is $16,000.

The Placer gold excitement has abated some at Salmo as nearly all the ground in that vicinity has been staked and the owners are now waiting till a thaw comes to see what their claims contain.

On the Deer Park mine at Rossland, the shaft will be pumped out and the work of sinking renewed. It is intended to sink until the 300-foot level is reached.

A member of the Goodersham-Blockstock syndicate in Toronto, informs the people there that the War Eagle Company has contracted for a large amount of material and the machinery for their smelter at Northport.

The sale of the Homestake, R. E. Lee and Maid of Erin by Mr. Linnard to an English syndicate has been definitely settled and Mr. Linnard has taken a large interest in the property himself and will return at once and act as manager of the property. One of the provisions of the sale was that a smelter should be erected this spring. The smelter will be located on the Maid of Erin ground and will be 350 tons capacity.

The Payne mine is shipping sixty tons of ore a day, which is more than any other Slocan property has ever shipped.

The Silver King mine is employing 180 men at the mine and smelter. At the mine a large rich body of ore has been unexpectedly found in the lower tunnel, which was being run to tap a body of ore discovered last year by a diamond drill.

Work is being steadily pushed on the Primrose group. This group is on a parallel vein with the Silver King.

The Two Friends, Slocan property, is now working twenty-five men, most of whom are employed on the 600-foot tunnel, which is being run to tap the ledge.

Things are running full blast under the Heinze management at the Kootenay and Columbia mine. The face of the long tunnel is in solid ore, which is fully 8 feet wide. The present showing is at a depth of 300 feet and it is thought that the ore will improve when more depth is gained.

Spokesman-Review: In the Slocan the Wonderful is working twenty-five men and the shipments from the mine amount to one-half car a day.

The Slocan Mining and Milling Company's concentrator is employing fifteen men. At present the mill is being run on Idaho ore.

The Mile Point at Ainsworth has recently passed into the hands of the British-Canadian Gold Fields Company. The new owners will employ twenty men in the further development of the property.

The British Canadian Gold Fields Company have bonded the Howard Fraction group of five claims on Springer creek, near the foot of Slocan lake. The bond was for $50,000, ten per cent of which was paid down; $17,000 will be paid October 1st. The new owners will put fifteen men at work developing the property at once.

UTAH.

Tribune: The plans for the projected mill upon the La Cigale have been approved and its construction will be commenced in the next ten days. The mill promises to be one of the most perfect that has been put up in the West. The tanks will be provided with a self-dumping device, everything will be on a system of gravity from the time the ore leaves the mine, and it is expected to handle ore at less cost than has yet been accomplished in Camp Floyd mining district. As planned, the mill will have a capacity of 200 tons a day with which to begin.

The mill at the Northern Light has been started up. Six tanks have been constructed and eighteen more will be put in as soon as possible. With these the mill will have a capacity for handling over 250 tons a day. The ores at present show an average of $12.75 per ton, with sufficient blocked out to last the mill for an indefinite period.

Eureka *Democrat*: The shaft at the Cornucopia, which is being worked under the Golden Treasure lease, is now down 254 feet, and is being driven as fast as two shifts can push it. It is the intention to run a drift to the vein from the 500 level as soon as that depth is reached.

Development is being pushed with as large a force of men as can work to advantage at the Jason Mining and Development Company's property. Some fine looking ore was encountered this week which assayed 56 ounces in silver.

The vein in the Domingo, adjoining the Buckeye at Silver City, has widened out to 2 feet and a shipment of $30 ore is being prepared.

Bingham *Bulletin*: Word comes from the Last Chance mines that connection between the British tunnel and Hooper has been made. The Hooper is making a large showing of ore, and a steady run of the mill is planned whenever the product can be hauled.

The output of the Old Jordan & Galena is likely to reach nearly 2000 tons this month, an average of eighty tons being the present daily shipment.

Mercur *Mercury*: The Wonder has broken into the vein.

The Brickyard crosscut is now about 185 feet in length, and the ore bodies hold their own well in appearance and size. An upraise has been made from the crosscut 20 feet all in ore, and this, added to the 20 feet of ore developed below, makes the vein at this point 40 feet in thickness and no hanging wall yet.

The shaft in the Gladstone is down 220 feet, and a blue shale, heavily impregnated with iron pyrites, is being encountered.

Tintic *Miner*: In the Picnic the ore has been struck on the 375-foot level, a short distance from the shaft, and shows values of 59.4 ounces silver, 48.5 per cent lead.

Shipments from the district for the week are as follows: From the Bullion-Beck mine, twenty carloads ore; Bullion-Beck mill, five carloads concentrates; Eureka Hill mine, five carloads concentrates; Ajax, nine carloads ore; Mammoth mill, eight carloads concentrates; North Star, two carloads ore; Dragon iron mine, two carloads ore daily; Noon's iron mine, one carload ore daily.

The Jason Mining Company has resumed work on the Silver Hill. The shaft is down 80 feet, and will be sunk at once 100 feet deeper. Considerable pay ore is already exposed in the workings of the property.

A new strike of ore is reported this week on the 500-foot level of the Four Aces.

Salt Lake *Tribune*: At Frisco, in the Horn Silver, the output consists of forty tons of concentrates and as many tons of crude ore daily. To accomplish this a force of 170 men is required, and at no time in recent years has the bonanza, which has presented dividends amounting to $5,130,000, presented a better appearance.

The lost vein for which the management of the Utah, in Deep Creek, has long been digging has been found. The success of the Utah was among the first things to draw attention to Deep Creek. From the grass roots the mine has paid. At a depth of 270 feet, however, the main ore body disappeared, and since that the stoping has been on a parallel chute. Recently it was decided to prospect for the vein off the station at which it was lost, and a letter from the superintendent assures the management that the lost chute has been found again.

WYOMING.

Near the summit of Medicine Bow range, in southern Wyoming, during the past year several Eastern syndicates have become interested in the camp and arrangements are now perfected to commence active operations on an extensive scale as soon as the season will permit. The ore bodies in this camp are principally a bluish quartz, carrying iron pyrites and assays give from $6 to $12 per ton gold.

A syndicate has, through J. W. Myers of of Salt Lake, obtained a bond on several of the most valuable gold and copper properties in the Seminoe mining district, in Carbon county, north of Rawlins. Among the properties bonded are the Penn, which was purchased some fifteen years ago by the Duponts and still belongs to the estate. A large amount of development work has been done on this property. A stamp mill was erected for the purpose of treating the ores by amalgamation, but proved a failure, owing to the refractory character of the ore. The King, Independence, Rawlins and Deadwood are also included in the bond, and considerable work has been done on these.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The Daleno Mining and Milling Company is building a chlorination mill for treating the telluride ores of Boulder county. During the past twenty-seven years every new process for saving the precious metals contained in the so-called refractory tellurides has been erected in this county on a small or large scale without any marked success. A bromine process built at a cost of over $80,000 by Henry R. Cassell and B. C. Hinman of New York, metallurgists and chemists, for the purpose of saving the gold and silver contained in the low-grade ores of the Keystone and Kekionga mines, the cost of treatment not to exceed $3.50 per ton, has shut down after an expenditure of over $150,000.

Prof. Cassell claims to be the inventor of the cyanide process which he claims has proven unusually successful on several grades of mineral that were free from the baser ore, such as zinc, galena, copper, etc. Boulder has had two elaborate plants built in which cyanide was used for the purpose of extracting the gold and silver from telluride ores, and although the owners, after spending about $100,000, claimed the process a success, yet both mills are shut down.

Two chlorination mills are now in course of construction in this city, and a third, to be known as the Boulder Ore Reduction Company, will soon begin the erection of a plant, at a cost of $150,000. The process to be used is chlorination and lixiviation and precipitation by electricity.

Chlorination has certainly been successful in treating ores throughout the mining districts of the great West, but has not been thoroughly tested on the telluride ores of Boulder county, and until the owners demonstrate beyond a doubt their ability to save the amount of precious metals contained in the low-grade (from $10 to $20) ores which are so abundant in Boulder county, the average miner will not enthuse to any great extent over promises.

We have rich gold mines in Boulder county; our mines produce gold ore, some of it yielding over $100 per pound. When the pockets are encountered in the Golden Age mine, Jamestown, the leasers often take out $2000 and $3000 in three or four days. Other leasers pan out from $20 to $30 per pound from their best ore, and retort it, then sell the tailings or concentrates, which are caught in a tub, for $3 or $4 per pound to the sampling works. Such rich veins are numerous in Boulder county mines, which are operated principally by sets of leasers on portions of ground throughout them.

The old Horsfal mine on Gold hill, the first lode claim ever discovered in Boulder county, by David Horsfal, in the spring of 1859, produced $100,000 in gold the first year by washing by rocker and sluice boxes; but of late years the property has not been in operation, until a lease and bond were obtained from Dick Blower, one of the original owners.

The Emancipation mine is producing rich mineral in large quantities. The property is owned by a London, England, syndicate, who purchased it last fall, after the mine had been idle for ten years through litigation over the crossing of two veins, Emancipation and Western Slope, each party claiming the intersection and the rich ore contained therein. About $50,000 was expended in fighting the case through the several courts, resulting in the bankruptcy of the original owners and the deeding of the mine over to the several lawyers for fighting the case. The interests of these several persons were bonded to one man; then the sale was consummated for $125,000.

Williamson & Haffner of Denver purchased the Scotch company's mill at Salina last week for the purpose of placing a new chemical process in the building to treat ore from their Great Britain and Sackcut mines, Sugar Loaf, which contain large quantities of low-grade mineral in combination with the high-class smelting ore. Mr. Williamson says he can treat his ore for $2 per ton and save over 95 per cent of the value contained therein.

The Milan mine at Sugar Loaf is producing a quantity of ore that yields $1 per pound. A specimen of the stuff is on exhibition in the window of the First National Bank of this city. This property is also owned by an English syndicate, and is rapidly improving by more extensive development.

WM. M. RULE.

Boulder, Colo., March 24th, '97.

Republican: The Cripple Creek Consolidated Company has started on the plan for the development of the Genevas. A station in shaft No. 1 has been cut at 450 feet, and sinking the shaft will be crowded with all possible speed.

The Good Will Tunnel Company has taken a contract to drive a drift from its tunnel on the vein cut in Ellen McGregor ground.

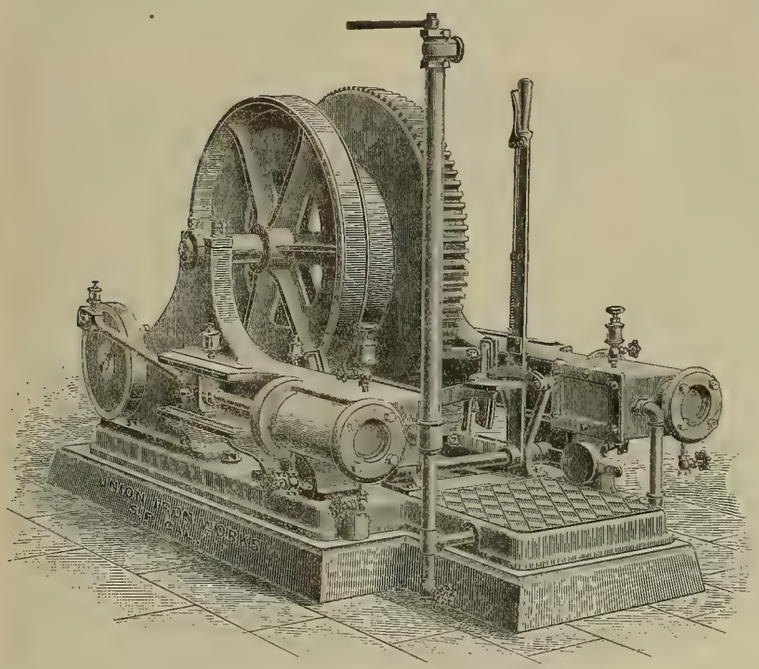
The new shaft-house and gallows-frame at the Granite are completed, and work under ground has been resumed. Manager Cone proposes sinking the deep shaft on the property to an indefinite depth, and will send out levels to explore the territory in all directions at each 100 feet.

The Chicago-Cripple Creek tunnel is being driven under Gold and Globe hills at the rate of 10 feet a day, and is now somewhere between 1,800 and 2,000 feet in. Three drifts are being run on low-grade ore, two on the 1,300-foot vein, and one about 400 feet farther in the hill. On the 1,300-foot vein about 200 feet of drifts have been run.

The Gregory shaft on the Raven group is down 380 feet and making progress of 2 feet a day. The tunnel from Squaw gulch is 2,000 feet into the hill, and is now driving ahead on the vein that cuts the Snowy Range and Maid of Erin.

The new extension of the Leadville mining district in a southerly direction shown by the Nil Desperandum strike is gaining in importance. This opened up an ore body on the west side of the fault in the Dome ground and since then the leasers have opened another ore body on the east side of the fault. The iron was struck at the bottom of a 125-foot shaft and on drifting in some 20 feet on the lower level a body of iron was found which runs from 6 to 30 ounces in silver and 36 to 37 per cent excess of iron.

The Nisi Prius Company some months ago secured a lease on the Crown Point ground on Rock hill and drained the ground of its immense amount of accumulated water. During the past few months development work has been vigorously pushed, and recently an important strike was made. An entirely new body of ore has been broken into, 14 feet high and 6 feet across the face of the drift.



The discoveries and renewed activity on Rock hill are the direct result of the reduction in smelter charges and the higher price paid for iron.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

Steam Engines and Boilers,
Triumph Concentrators,
Challenge Ore Feeders,
Rock Breakers,
Water Wheels.

The Proposed Tariff on Lead.

Considerable discussion still goes on in and out of Congress regarding the tariff schedule as affecting lead and lead products. The question is one of interest to American mining industries. The House of Representatives passed the tariff bill on March 31. In the Senate full data and convincing argument will be needed to alter the provisions regarding any dutiable article.

The bill as presented gives duty as follows: Lead in ore, 1 cent; lead bullion, etc., 2 cents; in sheets, pipe, etc., 2½ cents.

In this connection it is to be said that in a recent interview with a prominent smelter owner of Colorado he said to a representative of this paper:

"It is a matter of marked interest to note that the mining public of Colorado, who several years ago were decidedly opposed to the admission of lead flux ores of our neighboring countries, are to-day decidedly in favor of it, and their Senators and Representatives are advocating this adjustment in the House and Senate. It has been proved beyond any question that these lead ores are necessary to the successful operation of our American smelters. Fully one-third of our capacity would be closed down if it were not for the foreign ores. It is our desire to stimulate the price of lead, and we are confident that it cannot be done in any other way than by the adoption of this schedule of rates; and I believe that this proposition is demonstrable, first, because if the lead is admitted in the form of ores as a basis for lead smelting, these ores are distributed to smelting companies all over the Western States, and the lead product finds its way to the various markets in the United States and does not accumulate at any particular point. Moreover, it is not brought in in excess of the requirements of American smelters, to keep their capacity going and to smelt the siliceous and other refractory ores offered. On the contrary, if they were shut out they would be smelted in larger quantities in Mexico and Canada, and the lead bullion would accumulate at the large markets, and especially at New York, and this large, unnecessary accumulation, far beyond the ability of the local concerns to consume, always stands as a menace to the market, and frequently thoroughly demoralizes the prices. It must be taken as a primary proposition that the lead cannot be kept out of the United States. It must come in, and will come in; if not in one way, in another. Therefore, we hold that it should come in in raw material, and form the basis for American smelting and refining, and serve the best purpose to the largest number of American miners of refractory ores."

Another phase of the matter is presented in an interview this week in which a large smelter owner says: "In the lead tariff agitation within the past few days, appears evident the strong fight being made by the National Lead Company. They are proposing, and fighting with all their strength, for the exclusion of lead ores by a prohibitive tariff, and providing well for the possibility of importing large quantities of foreign refined lead and bullion. Their purposes seem:

"First—By the exclusion of lead ore they propose to weaken the power of all western smelting and refining interests by lessening their ability to secure lead flux ores, thereby curtailing to a very large extent their refined lead supplies, so that they will become less of a factor in the market.

"Second—They want to leave the doors open for the largest importation of foreign refined lead and bullion, so that they may be in position at any time to smash the lead market, and keep it in a demoralized condition, pending their accumulation of necessary supplies. It is a well-known fact in the East that the National Lead Company, whenever the market has been firm, with tendency to advance, have imported a large batch of foreign lead, and kept it in bond in New York. This so largely increased the visible supply as to stand as a menace to the market, and actually depreciated it, so that they could lay in their supplies; then they would reship the lead to Europe and sell. This is the kind of a proposition we are contending with now. It seems that in the very nature of things this would cement the interests of not only smelters and miners of silicious and other refractory ores, but the lead miners as well. Our desire is primarily to advance the price of lead, so that American mines, which are not now in operation, will secure a sufficient price for lead to enable them to operate and increase their output.

"In the next place, pending the increase of lead supplies in the United States, we want to fill up our deficiency from Mexican and British Columbia mines, so that the miners of silicious ore, iron ores and limy ores, which are non-lead bearing, may be in position to find an ample market for their ore. There is a strange condition existing in the Black Hills of South Dakota, where there are untold quantities of silicious ore and hardly a pound of lead or copper flux. There is no lead smelter in the camp, because lead supplies cannot be secured. The Missouri river cannot take the ores because they cannot secure the lead flux. The Black Hills miners are asking that their ore be taken; they are demanding lead ore absolutely free of duty, and both Senators from that State are advocating this plan. The Senators from Idaho and Senator Cannon, from Utah, are demanding a prohibitive rate on ore. It would be better if we could agree to a reasonable duty on lead in ore, and a higher duty on refined lead, so that the American mines located in the interior of a vast country, which must of necessity stand very high cost of transportation to reach the more settled districts of our country, which provide the markets, may have ample opportunity to mine their ores and get them to this market, leaving them something of a profit. Their best policy would be to agree upon this as a reasonable compromise, and a reasonable adjustment, as between the ore and the refined article, and all would find in the end that the improved price of lead would come not from the exclusion of ore, but from the advance in the duty on refined lead, which would restrict the importation of the refined article, instead of excluding the raw material and admitting the refined article.

"The National Lead Company manages to keep up the duty on white lead and keep down the duty on pig lead; the price of white lead does not decrease in proportion with the price of pig lead. The general interests of this company are detrimental to all of our western mining and smelting interests."

The present duty on pig lead is 1 cent per pound, lead in silver ore ¾ of a cent per pound, being just one-half of the duties in the McKinley bill of 1890.

DEWEY & CO'S
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.
Advice and Circulars free.

THE RUSSELL PROCESS CO.,
Park City, Utah.

Coast Industrial Notes.

—Alfalfa hay from Nevada is supplied in Grass Valley, Cal., at $10.50 per ton.

—Hollister, Cal., has voted for the issuance of $35,000 in bonds to put in a sewer system.

—Oranges which sell for fifteen cents per dozen in California, are worth $1 each at Circle City, Alaska.

—Construction of the first foreign warship ever built in the United States has been begun by the Union Iron Works, of this city, on the Japanese cruiser.

—The Santa Fe Railroad Company to-day inaugurates a 71-hour schedule for their "California Limited" between Los Angeles and Chicago. This makes a cut of exactly twelve hours in the time.

—The Tacoma Railway and Motor Company, operating most of the electric and cable street car lines in Tacoma, Wash., was sold last Saturday under foreclosure for $100,000 to the General Electric Company.

—The Vancouver, B. C., city council has made an agreement with an English firm to build a smelter and refinery there. The city gives exemption from taxes and 50,000 gallons of free water daily for ten years.

—The S. F. & S. J. V. road engineers commenced tracklaying on the Hanford route last Monday. The work will be pushed at the rate of a mile a day. Work has also been commenced by the graders on the Visalia route.

—Sonora, Tuolume Co., Cal., expects that the Sierra railway, from Oakdale, Stanislaus Co., will be built into that place and be in running order by Sept. 1st, '97. Graders are at work and some of the material is on the way.

—Construction of the Alviso, Cal., railway has begun and trains will be running between San Jose and Alviso during the summer. As soon as the track is laid, steamers will be put on between Alviso and San Francisco to connect with the trains.

—Construction has begun on the electric power enterprise, San Gabriel, Cal., where the entire flow of the San Gabriel river for eight miles is to be taken out of its natural channel, carried through tunnels and redwood stave pipes and dropped 400 feet to electric generators. The estimated cost is $750,000.

—At Everett, Wash., dredging in the harbor goes on night and day. The dredging will be 2900 feet long, 50 feet wide, with an average depth of 5 feet of earth removed. The dredging began about 2000 feet south of the dike, and the dirt is delivered through a long pipe 1000 feet inside the channel. The dredger pumps about 3000 yards of earth in twenty-four hours.

—The Folsom Electric Power Company asks from Woodland and Yolo county a franchise to build an electric road from Elkhorn on the Sacramento river, through Woodland up to Rumsy, in Capay valley. In payment for said franchise, electric power to run the street railway system, which is offered free to Woodland, will be furnished for almost nothing. The two propositions will probably be put to a vote of the people at the yearly municipal election.

—The California culture of olives has increased so rapidly that the State now has a monopoly of the market of this country. The crop last year netted $250,000 to the growers, but this year it is estimated the output will yield $3,000,000. The reason for the expected great increase is that a great number of orchards bear this year for the first time. It take seven years to bring an orchard to profitable bearing. Properly tended the trees continue to produce for centuries.

—President Ripley of the Santa Fe practically confirms the report of the deal between the Santa Fe and Southern Pacific, by which the former obtains control of the Mojave division of the Southern Pacific, extending from Mojave to The Needles, 240 miles. This piece of road heretofore has been operated by the Atlantic & Pacific, and the Santa Fe has trackage over it. By this deal, however, it will be placed in exclusive possession of the property and will now be able to reach the Pacific ocean over its own tracks, independently of any of its neighbors.

—The Nevada City, Cal., *Transcript* says that those parties holding the controlling interest in the Grass Valley Railway & Tunnel Company have reached an agreement with the controlling interest of the Gold Bank Tunnel Company as to the price and terms of the proposed sale. None of the Grass Valley Tunnel Company's stock was ever issued. The Gold Bank Tunnel Company's stock is owned by about 600 stockholders in Nevada City, Grass Valley, and a few in New York and London. No shares were ever sold for less than $1, and from that to $8. The management has kept a promise for twelve years that there should be no assessments.

—Consul-General Jernigan of Shanghai, China, says an important article of import at Shanghai is American lumber. To date, this has principally consisted of pine lumber from the States of Oregon and Washington, though considerable redwood from California also finds an appreciative market, as does timber from British Columbia. The eastern part of China is almost denuded of trees, causing the native supply of timber to be very limited. The regions back of Fuchau furnish considerable, not suitable for building purposes, in a foreign sense, but affording the means of a large traffic between the natives. It is from the Fuchau regions that the wood for making coffins is mostly obtained, the superstition of the Chinese permitting only certain kinds to be used for this purpose. From Hunan and other parts of western China large quantities of pine are cut and wafted down the Yangtze river, but as a rule it is of a very inferior quality. Some wood finds its way from the interior to Canton. Teak and other varieties of hard wood are imported from the East Indies, Siam and Burmah, and some pine timber comes from Japan. Recently a lot of railroad ties were brought from Japan to Tientsin. The rapid growth of Shanghai, and more especially the building of large cotton mills and silk filatures there and in other cities, have largely increased the import of pine timber. This will appear from the following table:

	1895—	
	Quantity.	*Value in U. S. Gold.*
Hardwood beams, cubic ft.	344,396	$137,768
Softwood beams, square ft.	4,380,371	63,078
Hardwood planks, cubic ft.	501,468	180,528
Softwood planks, square ft.	18,769,599	270,282
Teak planks, cubic ft.	30,353	9,769
Poles, pieces	9,872	3,949
Masts and Spars, pieces	127	20,320
Teak logs, cubic ft.	947	203

One of the largest lumber dealers at Shanghai furnishes the following statement of sales of pine lumber made by the principal lumber firms for the years 1893–1896:

	Square Feet.
1893	6,000,000
1894	6,000,000
1895	12,000,000
1896	14,000,000

The customs returns for 1896 are not yet published, but it is estimated that between 20,000,000 and 30,000,000 square feet of timber were imported during the year just closed, and that there were about 11,000,000 square feet on hand. As stated, the greater quantity of the lumber comes from the United States, and the quantity imported amounted in 1896 to 14,000,000 square feet.

—The engineers, who were forced to desist on account of the storms, will return to their labors to-day and complete the surveys, together with the cost of construction, for the Rawhide Gold Mining Company's electric plant in Tuolumne Co., Cal. The company has an option on two sites, and on the reports of the engineers in charge will depend the final selection. Should the one on the Stanislaus river be adopted, power will have to be transmitted seven miles; while should the report favor the Tuolumne, the distance would be thirteen. The *Democrat* says either one or the other will be agreed on very shortly, and on the first day of June work begins on the 1000 H. P. plant. The force generated will be used in operating the machinery about the Rawhide and App mines.

Personal.

H. F. CALENBURG has been appointed superintendent of the Gray Eagle mine in Placer county.

M. C. BULLOCK, president M. C. Bullock Manufacturing Company, Chicago, is visiting San Francisco.

ALMARIN B. PAUL has returned from Shasta Co., Cal., where he installed an electric plant for the National Mining Co.

CHAS. E. UREN of Grass Valley, Cal., is considering a London proposition to look into a Mexican mining property.

CHAS. A. BROCKINGTON has been reappointed superintendent of the Orleans Mining Co., Grass Valley, Cal., one of the oldest mining incorporations in the State.

CHARLES BUTTERS has left London for Johannesburg, South Africa, where he will remain some time—probably over six months. On his return he expects to come out to the United States again.

PRESIDENT MARK W. HARRINGTON, of the University of Washington, at Seattle, has sent his resignation to the Board of Regents and it was accepted. His place will be filled temporarily by the appointment of Professor W. F. Edwards.

R. L. DUNN, the mining engineer, who recently returned from an extended professional trip to Siberia, brings with him much hitherto unpublished information concerning that largely unknown, but interesting, country. In this week's issue is given a very comprehensive paper written by him on gold mining there. Siberia is quite accessible to trade from San Francisco. The MINING AND SCIENTIFIC PRESS suggests that the Manufacturers' and Producers' Association invite Mr. Dunn to deliver a lecture from his observations of Siberian trade and industry.

Recently Declared Mining Dividends.

Le Roi Mining Company, Rossland, B. C., $25,000; payable April 1st.

Penna M. Co., Grass Valley, Cal., 5 cents per share; payable immediately.

Idaho, Slocan, B. C., $20,000; payable March 25th. A total of $152,000 to date.

Alice Gold and Silver Mining Company, Utah, $20,000; payable April 7. Total to date, $1,015,000.

Calumet and Hecla Copper M. Co., Michigan; a quarterly dividend; $5 per share; payable April 23.

Morning Star Drift Mine, Placer Co., Cal., on March 29th declared dividend No. 76, of $5 per share, payable immediately.

Book Notices.

"Gold and Silver Ores. What Is Their Value? Simple Field Test for Prospectors With an Inexpensive Outfit." By William Hamilton Merritt, F. G. S., Associate Royal School of Mines; Lecturer, Mining Engineer, School of Mining, Kingston, and Instructor of Prospectors' Classes; late Commissioner Royal Commission on Mineral Resources of Ontario. T. R. & J. P. Clougher, publishers, Toronto. A handy little volume, which will be sent to any address upon receipt of price, 75 cents.

"Metals; Their Properties and Treatment," New edition by Professors Huntington and McMillan. Published by Longmans, Green & Co., 39 Paternoster Road, and 91 Fifth Avenue, New York. Intended largely as a text-book for metallurgical students, and up to date from an English standpoint. Is a book of 550 pages, with illustrated descriptions of the several processes of reduction of ores, smelting of copper, gold and silver extraction, etc. Price, $2.50.

Recent California Mining Incorporations.

Monte Cristo G. M. Co., S. F. C. W. Cross, F. P. Kelly, W. M. Abbott, H. Newburgh, W. D. Harper; capital stock, $1,000,000; $1250 subscribed.

Needed by Every Mining Man.

The MINING AND SCIENTIFIC PRESS of San Francisco is thirty-seven years old, and, if such is possible, continues to improve. It is the best and most reliable mining paper published in America, and no mining man should be without it.—San Andreas, Cal., Citizen.

London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

PRACTICAL WORKING TESTS OF ORE BY ALL PROCESSES.
STAMP MILL AND CONCENTRATOR IN OPERATION ON PREMISES.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to

A STEAM ORE STAMP.

One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL,** installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed. We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C McDONALD,
Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Pluta, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEPARATING THROTTLE VALVE.—John C. H. Stut, Oakland, Cal. No. 579,457. Dated March 23, 1897. This invention relates to devices by which the steam in the steam pipe is controlled on its way to its place of use, and it is especially designed to separate the water from the steam which may be intermixed therewith, so that all water coming with the steam from the boilers, and which results from condensation in the steam pipe before it reaches the valve, will be separated from the steam and allow the latter to enter the place of use in a dry condition, while the water will be led to a convenient receptacle. It consists essentially of a casing having a valve controlling the supply of steam to its place of use; a device for mechanically separating the water from the steam, said device consisting of a large number of small openings arranged in a plurality of separate sets occupying different vertical planes and separated by a space or passage so that the steam is caused, in passing through said openings or passage, to bend upon itself a plurality of times in its flow from the exit; said openings are made in parts adapted to be removed when worn for the substitution of others.

CUFF FASTENER.—Frederick E. Rockstroh, San Francisco, Cal. No. 579,331. Dated March 23, 1897. This invention relates to that class of fasteners adapted to attach the cuff to the inner surface of the coat sleeve, whereby the projection of the cuff beyond the coat sleeve is always the same, and the means of disengaging the two are such that it can be easily accomplished at any time. It consists of a plate having means whereby it can be secured to the part to which the cuff is to be attached; a freely movable ring or link connected with one end of the plate; a hook freely connected at one end with said ring; a double-headed shank button fitting to the button-holes of the cuff and having one of its heads provided with a loop or eye with which the hook detachably and slidably engages. In conjunction with this is a guard loop on the hook to engage its point to insure its engagement with the loop or eye of the button.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

FOR SALE.

The four Boilers now in use at the Crown Mills, together with Fronts, Valves, Grate-Bars, etc., are offered for Sale.

Delivery can be made on or about the 1st of May. For further particulars, inquire of

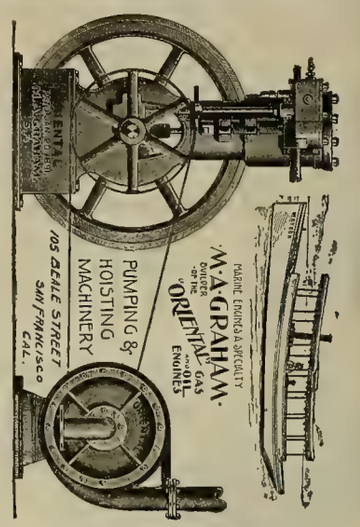
IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.



FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

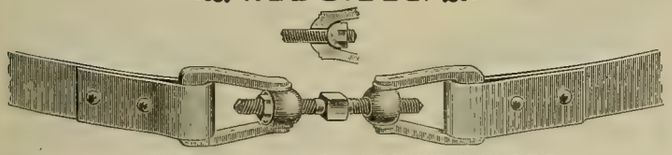
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.



PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

PATENT HOOP CLAMP.

ALL SIZES.

MALLEABLE IRON HEADS, WROUGHT IRON BOLT.

These couplings are easily applied. They are the best—most powerful. They have a direct pull, working freely with right and left screw on ball and socket joints tangentially to curvature of the tank. The turn-buckle principle of these clamps makes them lasting favorites with all who have once tried them. We use them extensively in our tank building department.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the milliman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Market Reports.

The Markets.

SAN FRANCISCO, April 1, 1897.

Business continues quiet but not more so than usual at this season of the year. Jobbers report that while trade is quiet it is steadily picking up with the outlook favorable to a large increase in the volume of goods over any previous season. It is thought that the call will be more pronounced when the crop season advances far enough to give assurances of large outturns. The impression prevails that there will be quite an increase in the call for harvest machinery the coming season. We are informed that considerable figuring is being done on new work for structural, mining and railroad purposes. The belief prevails that more work will be turned out this year than there was in 1896.

The local money market continues very easy, with more idle money coming out for investment. It is stated that rates are being shaded. There is not much demand for funds except from importers who wish to take imports out of bond. This continues to keep the premium on Eastern exchanges well up, considerably higher than rules at this time of the year. Those in position to know believe that this coming crop season there will be a freer demand for money than has obtained for several seasons past. This opinion is grounded on the present outlook, favoring large crop estimates for both grain and fruit, and, if realized, considerable money will be required to move them. From New York our advices continue to report an easy market in the face of heavy payments for goods withdrawn from warehouse. This, doubtless, is due to no large speculative movement in anything outside of wools, and also to free exports of merchandise and farm products. Sterling bills have advanced slightly, which indicates remitting to Europe for goods, and probably also that Europe is selling American securities, owing to the United States Supreme Court's decision—a case bearing against railroad combinations and similar organizations. In London the money market is easy, owing to large payments by the Bank of England on Japanese and other accounts. At other money centers war rumors affect the market.

New York Silver Prices.

NEW YORK, April 1. — Following are the closing prices for the week:

	—Silver in— London.	N. Y.
Friday	28¾	62¾
Saturday	28¾	62¼
Monday	28⅝	62¼
Tuesday	28 7-16	61⅞
Wednesday	28⅝	61 11-16
Thursday	28 7-16	62

	Copper.	Lead.	Iron.	Tin.
Friday	10 75@12 00	3 40	10 00@12 50	13 30
Saturday	11 70@11 90	3 40	10 00@12 50	13 25
Monday	11 70@11 85	3 40	10 00@12 50	13 25
Tuesday	11 70@11 80	3 40	10 00@12 50	13 20
Wednesday	11 70@11 75	3 40	10 00@12 50	17¼
Thursday	11 70@11 75	3 37½	10 00@12 50	17½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	20c Prem
New York Telegraphic Transfer	22½c Prem
London Bankers' 60 days	$4.86½
London Merchants	$4.85
London Sight Bankers	$4.89
Refined Silver, per oz., 1000 fine	62¼
Mexican Dollars	49½@50

SILVER.—There has been a steady declining the past week with the close reported steady and firmer at home and abroad. The action of Japan against the white metal and a bill introduced into Congress to return silver certificates and sell the bullion on hand have an unfavorable influence. The London market is said to be exceptionally weak, while at New York they are inclined to sell short even at the lower prices now ruling. It may be that the markets will recover slightly when the policy is known of the present administration towards getting support for international bimetallism and also its opposition against any measure to sell the supply now on hand.

MEXICAN DOLLARS.—The market has sold lower, in sympathy with the decline in silver. The demand in our market is light.

QUICKSILVER. — The Mexican steamer took out 135 flasks. The market holds to strong figures, with odds and ends about cleaned up. New York and London advices report the market working up to the last advance. Nearly all outside holdings have been cared for.

Our market is quoted at $40 for domestic consumption.

COPPER.—The market has sold lower at the East and in London. The decline was indicated last week. It is due to a slow demand from consumers, no speculative inquiry, continued liberal production and stocks increasing. When the spring demand sets in and consumers' supplies are worked down it is quite likely that better prices will rule.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	—@13¼
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

LEAD.—The market holds to fairly steady prices. The consumption in this country is steadily increasing.

Our market is quoted in jobbing lots as follows:

Pig	4 00	@	4 25
Bar	—	@	4 50
Sheet	5 62½	@	6 12½
Pipe	4 87½	@	5 37½

SHOT.—The market is steady with only a fair jobbing demand reported.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 35
Drop, B and larger sizes,	"	"	1 60
Buck, Balls and Chilled, do,	"	"	1 60

TIN.—The markets at the East and abroad have shaded off slightly for pig. In our market pig is easy, with continued cutting in prices of American. The consumption is quite active.

We quote as follows in a jobbing way:

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	$4 05@ 4 15
" " " light, "	3 95@ —

BORAX.—Shipments to the East by rail and water are quite free. The market is steady.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5¼
Powdered, in car lots	5
Concentrated, "	4½

POWDER—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—There is nothing new to report in our market. The consumption seems to be steadily increasing. Our foundrymen, as a rule, have good stocks on hand. The East reports continued activity, but at no advance in prices. Heavy shipments continue to be sent abroad.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The market is practically unchanged. For foreign the tone seems to be firm for spot, on passage and early shipment. Receipts have been lighter the past week.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Cuman	5 50@ 6 00
Seattle	5 50@ 6 00

Wallsend	6 50@— —

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 7⅛@8⅛c in a jobbing way. New York mail advices quote 7½c for Cookson's, 7@7⅛c for Hallett's and 7c for Japanese.

NAILS.—Notwithstanding the East reports advancing markets, ours is unchanged.

Wire, carloads, basis per keg	
" jobbing, " "	$2 25
Cut, carloads, " "	
" jobbing, " "	2 10

SPELTER.—The market is weaker. The East reports more offering.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The markets here and at the East are barely steady.

PLATINUM.—Dealers report a slow inquiry.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is steady at quotations.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM. — The market is steady.

We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—There is a slow inquiry.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is slightly easier.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

In our market there is nothing new to report. Business seems to be picking up, although it is still slow. Tariff agitation has somewhat of an unsettling influence, but the feeling prevails that on nearly everything higher duties will prevail.

BONEASH.—The market is unchanged.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is reported slow but steady at 2½c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but steady at $1.70 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Advices from the East report stiffer prices. With us no change is reported.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is fair. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—Our market is steady, but dull.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, April 1, 1897.

The market shaded off up to Monday, when a steadier tone set in, with shorts filling. At the decline there was considerable stock thrown out by margin holders. On Tuesday and Wednesday there was outside buying on the long side, which strengthened values slightly. The buying was largely due to points of a pending upmove and advices from the Brunswick lode that in Chollar and Occidental there was an improvement, in the former in the winze which is being sunk from the 200-foot level and in the latter in the work on the 500-foot level. For the past few days there have been more sales recorded than for several weeks past. Considerable of the sales recorded are said to have been cross orders for the purpose of inducing outsiders to buy at stronger prices. Present low prices do not offer any inducements to shorts; besides this, it would be hard to place a large line. Notwithstanding the unfavorable condition of the share market, it is conceded that for some time past there has been a steady absorption of shares by strong parties at the declining prices. Even with this buying in evidence, it is stated by the better informed that lower prices will rule before a good-sized deal is engineered; but in the interim there is liable to be a fair-sized rally. This opinion is based on the work in the mines, assessments levied and to be levied, and the general condition of business on this coast and at the East not being such as to encourage a belief that successful unloading at high prices can be engineered. Evidently the market for a big move is waiting for better times. Standard Con. shares have been inactive but steadily held, owing to the near approach of the spring months, when more active work can be resumed. The outlook for this mine is quite promising, provided it is honestly managed.

The news from the Brunswick lode is quite encouraging. In Occidental they are in 10 feet on the 550-foot level, which assays from $8 to $12 a ton gold. If this should prove to be free milling, it ought to pay something above cost of extraction, hauling and milling. On the 850-foot level the ore is still low-grade. In Chollar they are sinking a winze from the 200-foot level. At last mail advices they were in 4 feet of ore, giving $80 a ton. We are not advised if this is a new find or the ledge upon which they have been working. They continue to take out and mill ore. The south drift on the 500-foot level is being pushed ahead. They are in a total distance of about 175 feet. Within the next ten days a crosscut will be started to run for the downward continuation of the ore found above. The work in Savage, Best & Belcher and Gould & Curry is practically the same as reported last week, with no change in material encountered, or, at least, official letters do not report any.

Official letters from the Comstock mines are said to be quite satisfactory to the pools that are buying shares and freezing outsiders out of their holdings by assessments, and no encouraging advices are allowed to be reported by those who are supposed to be in charge. The muddle over the Hale & Norcross ownership has not as yet interfered with work in the mine, but suit brought for possession by the reported Grayson-Hayward combination is expected to stop work. It looks very much as if they were not ready to show up the ore which the Fox combination has contended exists in the mine. From the Alta group nothing new has come to hand. The work seems to be of a procrastinating character to kill time and indirectly "kill off" outside holders. Overman took out a few tons of ore the past week, just enough to make a showing. The work in this mine and California is unchanged. They are still after Belcher shares for no mention has yet been made of the reported strike some time ago, of a valuable body of ore. Official letters do not report on what level work is being done. From Segregated Belcher nothing new comes to hand. It looks as if news was being suppressed, for official letters do not conform to the law. In Crown Point they are working on several levels but with indifferent success so far as finding ore, but it has the effect of manipulators finding more shares at lower prices. From Yellow Jacket nothing is allowed to leak out. In Confidence they are still working on the upper levels. Work is still continued on Challenge, Confidence and Con. Imperial joint cross-drift. They expect to strike the west lode sometime in this month, unless work should be ordered stopped. In Alpha they are fooling around the 500-foot level. Work is continued by Bullion in the north drift heretofore reported. In Potosi they are preparing to stope ore from workings on the tunnel level. In Hale & Norcross work is confined to the 900-foot level. No work is being done by Chollar. The work in Savage, Gould & Curry and Best & Belcher is practically the same as reported last week. Both private and official advices from Con. Virginia do not afford any comfort to stockholders. Unless some ore is struck soon the shares are

Well Known Copper Mine
FOR SALE.
Mine well developed. Complete working plant. Situation and facilities first class. Address H. D. RANLETT, Ranlett, Amador County, Cal.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

likely to sell below present prices with assessment added. Work is reported on the 1000-foot, 1550-foot, 1650-foot and 1750-foot levels. It is not materially changed from our last week's report. There is nothing to warrant that much ore is intended to be struck soon. The Ophir letters reports work to the west on its 1000-foot level and upraising from the central tunnel. They passed through streaks of quartz assaying from $2 to $15 a ton. In Mexican they are pushing slowly to the west on the 1000-foot level. The material is unchanged. Considerable work is being done in Union both east and west. The material encountered looks well but does not "pan out" well according to official advice. In Sierra Nevada work is confined to Layton tunnel. No change is reported from Utah. In Andes they have made surface connection. Work has been resumed on the 175-foot level.

The following illustrates the changes of the week:

OFFICE OF THE HALE & NORCROSS SILVER Mining Company, Room No. 11, San Francisco Stock and Exchange Building, No. 331 Pine street, San Francisco.

To the stockholders of the Hale & Norcross Silver Mining Company and to all others concerned:

Notice is hereby given that, pursuant to the consent, in writing, of the holders of two-thirds of the capital stock of the Hale & Norcross Silver Mining Company, duly filed in the office of said company, the principal place of business of said Hale & Norcross Silver Mining Company has been changed from Room No. 3 of the San Francisco Stock and Exchange building, No. 331 Pine street, in the City and County of San Francisco, State of California, to Room No. 11 in the same building, where the business of said Company will be hereafter transacted. This notice is published in accordance with Section 321 of the Civil Code.

Dated March 19, 1897.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from T. C. Cox and W. C. Pidge, in the Philadelphia mines, near Columbia, Tuolumne Co., to deposit tailings in Rose and Eagle creeks, and from F. G. Curnow and others, in the Little Grass Valley Mine, near Columbia Hill, Nevada Co., to deposit tailings in an old reservoir, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on April 19, 1897, at 1:30 P. M.

Assessment Notices.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California. location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of March, 1897, an assessment (No.) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 47, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 3d day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47, Nevada block, No. 309 Montgomery street, San Francisco, California.

HALE & NORCROSS SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of April, 1897, an assessment (No. 111) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 11, 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of April, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 14th day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, 331 Pine street, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 24th day of February, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on FRIDAY, the 26th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on FRIDAY, the 21st day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 26th day of March, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on SATURDAY, the 24th day of April, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 19th day of June, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

STOCKHOLDERS' MEETING.—Notice of Stockholders' Meeting of the Steeple Rock Development Company: In accordance with a resolution passed by the Board of Directors of the Steeple Rock Development Company, a meeting of the stockholders of this company will be held at 3 o'clock in the afternoon on TUESDAY, the 11th day of May, 1897, at its principal office, No. 320 Sansome street, room 24, San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Million Dollars, in four hundred thousand shares, at the par value of five dollars each.

H. PICHOIR, Secretary.

Dated at San Francisco, Cal., March 26, 1897.

STOCKHOLDERS' MEETING.—Notice of Stockholders' Meeting of the Alaska Juneau Gold Mining Company: In accordance with a resolution passed by the Board of Directors of the Alaska Juneau Gold Mining Company, a meeting of the stockholders of the company will be held at 2 o'clock in the afternoon on WEDNESDAY, the 21st day of April, 1897, at its principal office, room 23, 320 Sansome street, San Francisco, to consider and vote upon a proposition to increase the capital stock of this company to Five Million Dollars, in five hundred thousand shares at the par value of ten dollars each.

R. M. MEIN, Secretary.

NOTICE TO CONTRACTORS.

The Monterey Power Company invites bids for putting in its entire plant, dam, flume, wheels, electrical apparatus and pole line from Little River (22 miles south of Monterey City) to Monterey and Salinas City, for the generation and transmission of electrical current of not less than 450-horse power; entire distance being approximately 37 miles.

Bids will be received up to SATURDAY, April 17, 1897, at 2 o'clock P. M., at the company's offices, Monterey City, Monterey County, Cal., where plans and specifications may be seen.

All bids must be accompanied by a certified check for ten per cent of the sum of such bid. Checks to be payable to the company and to be held upon the usual conditions.

By order of the Board of Directors.

F. A. BOTSCH, Secretary.

SEALED PROPOSALS.

Bids will be received at the office of the undersigned until 5 o'clock P. M. on MONDAY, April 5, 1897, for 3000 feet of 6-inch cast-iron pipe, dipped and delivered at the freight sheds in this city, and to weigh not less than 30 pounds to the foot. A certified check, made payable to City Clerk, for an amount not less than 10 per cent of bid, must accompany each bid. The Board of Trustees reserves the right to reject any and all bids.

Sacramento, Cal. M. J. DESMOND, City Clerk.

Skeleton Mining Report.
OF GREAT PRACTICAL VALUE
—TO—
MINERS AND MINE OWNERS
In making a comprehensive report on mining properties which they desire to present to the consideration of investors or describe for absent owners.
Useful and convenient to mining engineers as a field notebook, presenting in compact form a skeleton of the information required to form an adequate estimate of a mining proposition.

Assaying Gold
.....AND.....
Silver Ores.
A Standard Work.
THIRD EDITION JUST OUT.
By C. H. AARON.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

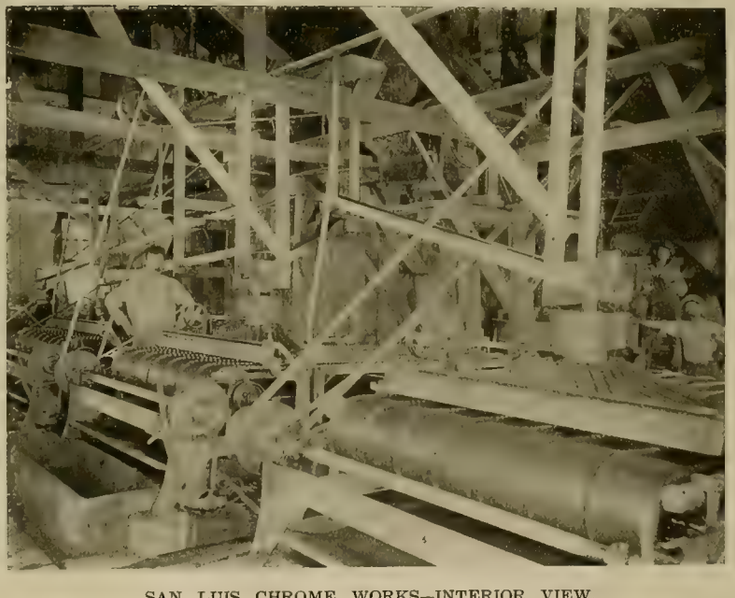
Chrome Ores.

Chrome ore, like quicksilver, is one of the mineral products of the United States mined only in California. Some years ago the shipments from the State were quite extensive. Chrome ore has been produced in California and shipped to the East for nearly forty years. Many people upon discovering a body of chrome ore think it of more value than it really is. The value of chrome ore laid down in San Francisco ready for shipment around the Horn is not over $10 to $12 per ton. A very large proportion of the ores of this State are of low grade, carrying less than 50 per cent. Ore carrying from 50 per cent up only is considered high grade enough to work.

Of late years there has been considerable falling off in the demand for and shipment of California ore. This is to be attributed to several reasons. The main supply from abroad is from Russia and Turkey, within reach of cheap transportation. These ores come into the United States free of duty; they are mined by labor little better than slave· they are often brought over as ballast and the freight is very low. The ores from Smyrna and the Ural mountains are as a rule higher grade than those found in California, within reach of cheap transportation. The ores from the Ural mountains and the Caucasus, which commanded the world's market in 1877, contain from 53 to 55 per cent chromite. In 1877 large deposits were found near Smyrna, in Asiatic Turkey, which were soft and granular in texture, easily mined, not far from a shipping point, contained from 55 to 58 per cent chromite and were comparatively free from silica. Chrome ore in the Black Lake district in Canada has been mined during the past few years and the shipments in 1895 amounted to about 2500 tons.

In the United States the great center of bichromate manufacture is at Baltimore, Maryland, the first deposits in this country having been worked in that State. They are now practically exhausted. The total product of the United States for several years, all from California, has been from 1500 to 2000 tons annually, while the total consumption has been about 5000 tons. The world's consumption is about 80,000 tons, about half of which comes from Turkey.



The old firm of Kruse & Euler was for many years in the business of shipping these ores from California, and they received samples of chrome from nearly every county in California. Several of the deposits of the highest grade have been worked out, but many others remain unworked because they are in comparatively inaccessible places, where the cost of transportation prevents their being mined profitably.

It has been suggested that a duty of $2 or $3 a ton on this article would enable this State to furnish the total amount required for consumption in the United States and in time supply much for export.

At the present time chrome is being mined in Tehama, Shasta and San Luis Obispo counties mainly. At San Luis Obispo the San Luis Chrome Company has concentrating works.

SAN LUIS CHROME WORKS—EXTERIOR VIEW.

SAN LUIS CHROME WORKS—INTERIOR VIEW.

THE new law as to locating mining claims passed at the late session of the Legislature will go into effect May 25th. It was published in full in the MINING AND SCIENTIFIC PRESS March 20th. There are so many provisions made as to what shall constitute a valid location that have not been upon the statute books of this State, that it behooves all those who are interested to carefully read the law. Heretofore there has been a great deal of guesswork as to how locations should be made and most of them have been made carelessly, many with resultant litigation. One advantage about the new law is that it may be easily understood by miners without legal advice. The provisions as to what must be done are plain, although they entail upon the locator considerable extra work.

The Law and Veins, Lodes and Mines.

In a brief in a case before the Superior Court of Lake County, Mr. A. H. Ricketts of this city gives some interesting data as to what constitutes a "vein or a lode" or "known mines" in the eye of the law. He says:

"By the term 'veins' or 'lodes,' as used in the mining acts of Congress, is meant lines or aggregations of metal embedded in quartz or other rock in place; both are intended to indicate the presence of metal in the rock.

"But it is not enough that there may be some indications by outcroppings on the surface of the existence of lodes or veins of rock in place bearing cinnabar or other metal to justify their designation as 'known' veins or ledges.

"A 'vein' or 'lode' is not *known to exist* until it has been discovered and *located*—that is, that its boundaries have been specially marked on the surface, so as to be readily traced, and the notice of location is recorded in the usual books of record within the mining district in which it is situated.

"It follows, therefore, that a vein is not 'known to exist' in the law except by an *actual discovery* of the vein *within a given location*.

"The existence of the location is a matter which every one is legally presumed to know. The existence of a 'mine' is not known until ore has been extracted or shown to exist in sufficient quantities and value to warrant extracting within the boundaries of the claim located; until then the location is a 'prospect,' and the mere existence of shafts, tunnels, inclines and stopes on the vein, no matter how extensive such excavations may be, is not evidence of a mine of value; or, in other words, a 'vein' is the work of nature; a 'mine' is the result of man's handiwork in disclosing the mineral contained in the vein.

"Or, in other words, a 'known mine' may be said to be one which is especially recognized by the natural material having been made visible (and productive) through workings or exploration, and not until then is it a 'known mine' within the meaning of the statute; or, again, the term 'mine' is generally equivalent to a 'worked vein, for by working the *vein* it becomes a *mine*, for 'A mine is not properly so called until it is opened; before that it is but a 'vein.'—Astry v. Ballard, 2 Mod. Rep., 193; King's Bench 28 and 29, Charles II.

"And this was the opinion of Lord Coke in his First Inst. 54-b, where he tells us that if a man demise lands and mines, some being opened and others not, the lessee may use the mines opened, but has no power to dig the unopened mines."

The U. S. statutes intend that a "known" mine should be synonymous with an *operated mine*.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 314.

The Gold Miners' Convention.

The National Mining Bureau of Colorado has issued a call for an international gold miners' convention to be held in Denver on the 15th and 16th of June next. It is proposed to have in connection with it exhibits of gold ores and a general mineral display. A request is made that State mining bureaus, schools of mines, boards of trade, chambers of commerce, mining exchanges, and all mining organizations co-operate in forming the exhibit, and send delegates. Each county in the mining States, and in the mining districts of British Columbia and Mexico are asked to elect delegates. Governor Adams of Colorado has been named as President of the convention, and Irwin Mahon as Secretary.

It is to be hoped that the Executive Committee of the California Miners' Association will take steps to see that this State is properly represented. Of late years Colorado has done more than California to interest Eastern and European capital in the development of mining, and especially gold mining, in the West, and the influences of such a gathering as proposed should be large in that direction.

Yet in other respects the proposed convention should be of still greater value to those who do not have mines to sell, but desire to keep in touch with all that is new and best in the working of mines. Coloradans have learned much from California about mining, and vice versa. It would seem that no miner could attend such a meeting without bringing back much of value to himself and to others. A similar convention held annually and in different mining centers in the West would be a valuable educational institution.

The Surplus Population of New Mining Camps.

In nearly every new mining district in the West there is a greater surplus of unemployed men than in the older camps. As a general rule, there is less demand for labor in these new districts for some time after their discovery, and until capital comes in in sufficient quantity to develop them. A skilled prospector needs little advice as to where he should go; he has means of finding out and knows well how to take care of himself under the most adverse circumstances. This may be said of most miners of long experience; but the men who make up the large surplus of the unnecessary population in the new mining camps are nearly all men of smaller experience, and, to a certain extent, useless. Hundreds of men have gone to the Randsburg district who have no knowledge of mining, but imagine that they can find something to do. So it is with the camps in British Columbia; so it is with Alaska. Warnings are continually sounded through the local papers published in all those districts to people to stay away. Probably the best advice that could be given to those who earnestly desire to learn something of mining is to choose the older camps, for in these there are more opportunities for unskilled miners than in the new districts, where men are compelled to depend so much more upon their own resources.

The California Legislature and the Mining Industry.

Altogether, the mining industry has fared very well at the hands of the late California Legislature. Heretofore there has never been any attention worth speaking of devoted by Legislatures to the mining industry, and as a result there has been considerable confusion and resultant litigation, particularly as to location rights.

Last October the MINING AND SCIENTIFIC PRESS suggested that the California Miners' Association take up this matter, and it did. As a result, the foundation has now been laid for a good set of mining laws for California. In all the scandals connected with the last session of the Legislature there was no sign of anything of the sort attached to any of the legislation connected with the mining industry. The members all appreciated the importance of the revival of mining, and seemed willing to do whatever they could to help it. No appropriations were asked. Miners are self-reliant. All that they ask is permission to use the machinery of the State government only when it is absolutely necessary.

Of the bills passed it may be said of some of them that they are experimental and may need revision at the hands of the next or some future session; but in the main they all tend in the right direction, and enough good has been done to enable the Miners' Association to, with very little work, procure amendments or additional laws from the next session. Of those passed that prescribing the manner of locating mining claims is probably of the most importance to the miner. The bill was published in the MINING AND SCIENTIFIC PRESS March 20th. As to Section 3, which provides that within sixty days from the date of the discovery of the vein or lode, or of the location of a placer claim, the locator must perform $50 worth of labor in developing the property, many communications with adverse criticisms have been received. It is claimed that the time allowed for the performance of the work is too short. It is pointed out that in some of the higher altitudes storms will often prevent complying with this, especially in the beginning of winter or in the early spring. There is much to be said in favor of an extension of the time allowed.

Mr. Soward's bill as to recording notices—an amendment to Section 1159 of the Civil Code—bears upon the bill referred to above, and is as follows:

Judgments affecting the title to or possession of real property authenticated by the certificate of the clerk of the court in which such judgments were rendered (and notices of location of mining claims), may be recorded without acknowledgment, certificate of acknowledgment, or further proof. The record of all notices of location of mining claims heretofore made in the proper office without acknowledgment, or certificate of acknowledgment, or other proof shall have the same force and effect for all purposes as if the same had been duly acknowledged, or proved and certified as required by law. Affidavits showing work or posting of notices upon mining claims may also be recorded in the Recorder's office of the county where such mining claims are situated.

Another bill passed amends Section 15 of the act of March 30, 1868, so that in town lands granted to unincorporated towns in this State by the act of Congress of March 2, 1867, within six months after the plat required by the act has been filed, if there shall remain any unclaimed land, any one discovering gold upon it shall be considered a preferred purchaser.

An act recommended by the California Miners' Association, and passed, provides that the directors of any mining corporation shall not sell, lease, mortgage or otherwise dispose of any mining ground, or purchase or obtain in any other way except by location, any additional mining ground, unless such act be ratified by at least two-thirds of such corporation.

Another act passed amends the statute of March 30, 1874, for the better protection of the stockholders of mining corporations formed under the laws of the State of California, so as to provide that only such corporations as have their stock listed on a public stock exchange must file and keep for the inspection of the other holders reports of the secretary and superintendent, and that these reports shall be made monthly, instead of weekly, as under the old act.

An act repealing the act of March 28, 1874, and acts amendatory to it, providing for the sale of mineral lands in the school sections 16 and 36 granted by the Federal Government, was discussed in these columns while it was before the Legislature. Those acts were declared void by the decision of the United States Supreme Court, and their presence on the statute books have resulted in considerable confusion and in many cases have led to no little extortion and blackmail.

The debris bill reappropriates $250,000 appropriated in 1892, to be expended in conjunction with a like amount provided for by the Federal Government for building restraining dams.

While not a mining bill, the drainage Act appropriates $300,000 for the improvement and drainage of navigable streams—particularly the Sacramento and its tributaries—and should do much toward clearing a way for reopening of hydraulic mines.

Of the measures proposed, and which failed of passage, several were of considerable importance. One was Mr. Caminetti's bill proposed by the MINING AND SCIENTIFIC PRESS last October, relating to the liens of miners upon mining claims. Another was Senator Prisk's bill, providing for the appointment of a mining inspector. Another was a bill to amend Section 605 of the Penal Code, relating to the removal, defacing or altering land marks; and another was a bill proposed by this paper to amend and give wider scope to the Act providing for the prevention of robbery of bullion, ore and other valuable material from mines.

The New Road Bills.

The cost of transportation in nearly all the mining districts of California is a very heavy item of expense to the owners of mines. During the past winter the MINING AND SCIENTIFIC PRESS has often called attention to the heavy losses incurred through failure to take in supplies ordered. Many mills that were ordered in October, November and December, and whose stamps should now be crushing ore, are lying along the roads between the railway and their destination. The losses incurred should be sufficient lesson to the people, who are themselves responsible in great measure for this condition of affairs. The Legislature has passed a number of laws with a view to improving the roads in all parts of the State. Yet unless the voters themselves are more careful than they have been in the past to choose honest and intelligent representatives to care for the highways these laws will accomplish little.

It would seem that in the mining counties the local miners associations could do much good in this respect, and certainly it is within their province to make the attempt. Candidates for office might be pledged to do their simple duty in carrying out the laws honestly. Certainly no politician in the mining district would care to offend such an organization as the Miners' Association. The work done so far by the State in legislation and by many counties in improving the roads has been through the influence of the bicycle clubs and similar organizations. Little can be expected in the way of influence from this source in the mountains, and it behooves the miners to take the matter up.

The bills passed by the Legislature provide a general law for the State, dividing the roads into three classes—State, county and district. The State highways should, in a measure, fill a great want for large arteries leading to the more important districts away from railroad communication. Good work done upon them will have a salutary effect upon the county and district authorities in the way of object lessons.

Altogether the machinery is provided for obtaining good roads, but it remains with those directly interested to see that it is honestly and intelligently used.

Concentrates.

THE Anglo-Mexican Company of Mexico reports for February an output of $41,960.

A 5-STAMP mill is to be erected on the Conant mine, at Harrison gulch, Shasta county, Cal.

THE Comstock, Nev., paid $60,415.16 to employes in March, 1897, $2000 larger than in February.

THE question of dividing Lincoln county, Nevada, is to be submitted to the voters at the election in 1898.

THE Garfield-Virginia mine, in Tuolumne, Cal., has been bonded to C. M. Cross of San Francisco for $25,000.

THE next meeting of the B. C. Association of Mining Engineers will be held at New Denver about June 1st.

A BILL has been introduced in Congress for the establishment of a Government assay office at Baker City, Oregon.

THE export of gold from British Guiana from January 1 to March 1, 1897, was valued at $218,525, against $192,678 for 1896.

THE U. S. Debris Commission has revoked the permit granted the S. P. V. G. M. Co., Cherokee, Butte county, Cal.

THE Russian gold reserve in the Treasury and State bank, according to an official statement March 28th, was 808,500,000 roubles.

SUPERINTENDENT DOGGETT of the San Francisco Mint has an order from Director Prescott for the coinage of 800,000 silver dollars.

LAST week a blast of 70,000 pounds of powder was fired at the Morena dam in San Diego county and 100,000 tons of rock dislodged.

SAN FRANCISCO men are negotiating for the purchase of the Lucky Bill, near the Enterprise mine, near Fresno Flats, California.

A THOUSAND carloads of mining timbers, machinery and supplies have been received at Kingman station, Arizona, since the first of January.

THE monthly reports of mining companies will be filed on the second Monday of each month, instead of the first Monday under the old law.

WHAT are represented to be extensive bodies of high-grade copper have been discovered on the Mashel river, thirty miles south of Tacoma, Wash.

THE United Globe Copper Company of Arizona propose to erect larger hoisting works on the Hoosier shaft and increase the output of the mines.

ACCORDING to the *Arc-Light*, the owners of the Lightner mine, adjoining the Utica, at Angels Camp, California, propose to erect a 20-stamp mill.

BORING for oil at Richland, San Diego county, Cal., has been under way some time, and last week at a depth of 300 feet signs of petroleum were found.

THE $5000 mining inspector bill which passed both houses of the last California Legislature, was one of the measures pocket-vetoed by Governor Budd.

ROBERT G. SMITH has brought suit in Salt Lake to recover a one-fourth interest in the Ben Hur Gold Mining Company's property, in White Pine district, Nevada.

THE Butte mine, in the Rand district, Kern county, Cal., has, according to a press dispatch, been sold to Wilson, owner of the Wilson House at Butte, Montana, for $60,000.

THE Arizona *Republican* announces that Rochester, New York, capitalists offer to erect a large smelter at Phœnix if the city will grant them sufficient land for the plant.

ACCORDING to the *Spokesman-Review* of Spokane, Washington, ore has been found in the Anchor mine which carries nickel, cinnabar, copper, gold, some silver and cobalt.

THE owners of the April Fool mine at De Lamar, Nevada, who have been paying wages of $3.50 per day, have issued a notice that after the first of April they will pay $3 per day.

AN English syndicate that has a bond on the Commander mine at Rossland, B. C., at $250,000, has called for and been granted an extension of time of twenty days, or until May 10.

A NEW pump has been forwarded to the Thistle Shaft, near Gibsonville, Plumas county, Cal., and the work of clearing the big drift mine of water will be commenced in a few days.

AT Harrison gulch, in Shasta county, California, a tunnel, now in 400 feet, is to be run 4500 feet through the Conant and the Hurst & Fowler locations in the Lucky Baldwin locations.

LEAD during the week sold as high as $3.35 per 100 pounds—a higher figure than it has reached before since August, 1895, when the price was $3.37½. Since that date it has gone as low as $2.50.

AT Mercur, Utah, the management of the Brickyard property announce that as soon as the snow has gone the work of building a mill with a capacity of 200 tons daily will be commenced.

THE Reid mines, in Old Diggins district, in Shasta county, Cal., have been bonded to W. H. Clendenin, E. A. Reid and J. M. Salnave, owners, and A. B. Paul and Samuel Sandry, for $60,000.

THE value of the products of the lode mines of the Kootenay, British Columbia, for the quarter ending March 31 was $2,151,858.58. The total product for the year 1896 was $4,257,179.

IN British Columbia a means of beating the law as to assessment work on locations is being worked in some districts by a system of relocations similar to that in vogue in places on this side of the line.

A PRESS dispatch from New York reports that English capitalists are endeavoring to secure control of the Butte & Boston copper properties in Montana and the Old Dominion copper mines in Arizona.

THE Provincial Legislature of British Columbia has passed an act forbidding the employment of Japanese or Chinese. The Chinese had already been barred from employment, to a certain extent, in the mines.

THERE is a small army of prospectors in Rossland, B. C., waiting for the snow to melt so that they can go into the mountains. Many of them will go farther north than last season into the Salmon and North Fork districts.

THE owners of the New Idria mines are asking the Fresno county, Cal., authorities to build a few miles of road that will give them connection to ship their product by way of Mendota. At present shipments are made by way of Tres Pinos.

THE world's production of manganese ore is about 500,000 tons annually, of which it is estimated 250,000 tons come from Russia, 43,000 from Germany, 36,000 from Chili, 33,000 from France, while only about 15,000 tons are produced in the United States. In this country manganese ore can be delivered at New York from Cuba or Russia cheaper than from Arkansas or Colorado. There is imported about 90,000 tons annually.

THERE are estimated to be between 2000 and 2500 men working along the banks of the Snake river between American Falls and Bliss in Idaho placer mining. The work is done on a small scale and the men make from $1.50 to $10 a day each.

ARIZONA papers are advocating big tunnels for tapping some of the mining districts of that Territory. It is claimed that in many places in Arizona large numbers of veins could be cut from 1000 to 1500 feet below the apex by tunnels 3000 feet long.

PRITCHARD MORGAN, a member of the English Parliament, is in China and was lately in consultation with Li Hung Chang in regard to developing mines. Mr. Morgan has done considerable work in endeavoring to develop gold mines in Wales.

VADNER & FRISBEE at Bingham, Utah, have leased ground near the Bingham Copper Company's mines with the intention of constructing a precipitating plant to treat the sulphate of copper in solution seeping from mineral veins of that locality.

A WAGON ROAD to connect Hay Fork, in Trinity county, with Redding, Shasta county, Cal., is about to be built. The Board of Supervisors of Shasta county last week received bids for building that county's section, and they ran from 76 cents a rod to $2.24 per rod.

LAST week occurred the first strike in the history of Tuolumne county. The manager of the Soulsby mine announced that there would be made a reduction of 50 cents per day in wages and fifteen men walked out. Later all the men resumed work at the old wages.

AT the first general meeting of the New Goldfields of British Columbia, Limited, in London, the chairman stated that he had dispatched a man to the Fraser river property to erect a new dredger. The directors are negotiating for the erection of smelting works in British Columbia.

MINERS should not be fooled by proffers of "write-ups" published on a coin basis, notoriously incorrect, and of no value. As the Redding, Cal., *Searchlight* says: "The best write-up that the resources of any county can have is the enterprising weekly that the community supports."

THE treaty with Great Britain providing for an arbitration tribunal for the settlement of the disputed Guiana boundary has been unanimously ratified by both houses of the Venezuelan Congress. This will give an impetus to many proposed schemes for exploring the mining districts of both countries.

WHATEVER may be the sins of the last California Legislature, be it said to its credit that it did a great deal for the mining interests of the State, and that, too, without the shadow of a suspicion of unworthy influence, the need of such legislation being generally recognized and universally understood.

IN the Rand, South Africa, on the Robinson Deep, the shaft at 2390 feet has struck the south reef, which is 6 inches wide and assays five ounces per ton. This same reef at 1800 feet was 1 foot wide and assayed three ounces per ton. The shaft at 2390 feet in depth was 3900 feet from the outcrop.

SAMUEL NEWHOUSE, and his European associates, last week made a final payment of $91,000 and acquired full title to the Highland Boy group of claims at Bingham, Utah, upon which they have run 500 feet of tunnels, shafts and drifts. The erection of a mill with a capacity of 200 tons daily will be commenced immediately.

F. R. BAKER and C. H. Ross of Tacoma, Wash., have incorporated the Union Milling and Smelting Company; object, to apply the hydrocarbon principle in smelting. This is an old principle in the science of metallurgy. The manner in which it is to be applied by the new corporation is patented by Barron Bros. of Tacoma, Wash.

A GROUP of twelve coal claims in San Carlos reservation have been developed slightly by Hendersen and Crowe, who sunk a shaft 90 feet, which cut two seams of coal, 36 and 66 inches in thickness respectively, which are reported to be of good quality. Further work will not be done until the fields are thrown open by the Government.

THE Black Bear Quartz Mining Company of Siskiyou county Cal., which has gone through many vicissitudes in its long history, is applying for patents for its claims located over thirty years ago and from which between two and three millions have been taken in gold. A much smaller proportion of mine owners in California have applied for patents than in newer districts in other States.

THE owners in London of the Banner mine in Butte county, California, have formed a new company—the Consolidated Gold Mines of California, Limited, to purchase and work the Long's Bar, Clark, Coffee and Hedges. The owners will receive in payment £100,000 in paid-up shares out of a total of £250,000. These properties, as well as the Golden Feather, Morris Ravine and Golden Gate, are managed by George H. Evans, with headquarters at Oroville.

A SHORT TIME ago the Boston & Montana Company of Montana sued the Montana Ore Purchasing Company for $600,000, for ore alleged to have been taken from the plaintiff's ground on the Rarus lead. Now the Montana Ore Purchasing Company have entered suit against the Boston & Montana Company for damages in the sum of $2,200,000, the net value of ores alleged to have been worth $3,000,000 and unlawfully extracted from the plaintiff's property in another part of the same Rarus lead.

THE California State Mining Bureau has issued its bulletin No. 11, on "Oil and Gas Yielding Formations of Los Angeles, Ventura and Santa Barbara Counties," by W. L. Watts. The importance of this new industry in the counties named justifies the careful and exhaustive work done by Mr. Watts for the State. It is valuable, especially to those engaged in the search for the product. The field covered is very extensive and it has taken a long time to prepare the data. The bulletin should have been published some months ago, but owing to the unusual amount of work in the State printing office it has been delayed. At present Mr. Watts and several assistants are at work in San Luis Obispo county, and another bulletin will be issued during the year. All the oil fields of the State, and those districts in which there is a probability that oil may be found, will be covered if the present intention of the bureau is carried out. In addition to the geological work, there is much data of value in this first bulletin as to the refining of the crude oils of the State, which require methods different from those in vogue in the Eastern States and in Russia.

IN an article on the minerals of Montana, G. C. Swallow calls attention to what he describes as a copper placer in a small stream between Jefferson City and Beaver Station, on the old stage road. He says: "My attention was attracted to it by seeing my horses' shoes covered with bright copper after driving through it. I found the water strongly impregnated with a solution of copper and the sand in the bed of the brook filled with bright crystals of the same material."

THE Montana Legislature has passed an act which provides that when any mine is worked by means of a vertical shaft more than 300 feet deep only iron-bonneted safety cages, enclosed by an iron, steel or wire casing, can be used; that the doors shall be 5 feet high and shall be adjusted either on hinges or rollers. The bill further provides that the safety dogs shall be inspected and kept in proper order, and that any one failing to comply with the law shall be fined from $100 to $500. Then, Montana has a mining inspector and can afford such laws.

CAPTAIN WILLIAM HALL, superintendent of the Le Roi mine at Rossland, British Columbia, has had a number of mill tests of ore from his mine made with results of importance to the district, in that they showed that the gold in the ores of the mines about Rossland is almost wholly free. He has, in consequence, recommended that his company erect a mill of about 80 stamps. The saving in the cost of shipping alone would enable the working of much ore that is now of too low grade to be handled, and would largely increase the value of most of the properties in the district.

THE books of the Florence and Cripple Creek Railroad Company and the Midland Terminal Railroad Company show that the tonnage output for the Cripple Creek district for the month of February amounted to 18,200 tons, or 650 tons of ore per day. These figures do not include the ore treated at the Hartzell, Brodie, Globe, Gold and Gold Geyser mills, which would bring the total up to 725 tons per day. Of this amount 7500 tons were sent to the smelters and the balance to the different cyanide and chlorination works. The total tonnage output for March has not been figured up, but it is known that a decided increase has been made in the output over the preceding month.

IN Rhodesia, South Africa, work has not been recommenced in the mines since the war, in which the machinery and plants were for the most part destroyed, and most of the work that was done must be done over again. It is not any fear of a fresh outbreak that hinders mining, but the difficulty of transport. The war destroyed the machinery and plants and the rinderpest destroyed the cattle, and, of course, the transport. It is generally considered by the Rhodesian mining companies that it would be better only to do tentative work until the railway is completed from Buluwayo, which it will be by the end of the year, when stores, plants, etc., can be brought in at much smaller cost.

THE cost of shipment of supplies to South Africa is probably as great as ever they were in the most inaccessible districts of the western part of the United States, and the exorbitant charges on the African railways, due to the rapacity of the Boers, have much to do with retarding the industry of mining there. An illustration is given by the London *Mining Journal* of the cost of seventeen shipments of mining machinery from England. The cost in London was £11,140, and the ocean and railway freights, landing charges and customs brought the total cost at Johannesburg up to £28,606. Of this the railway charges amounted to no less than £11,493. The distance hauled over the railway is only 667 miles. On the last fifty-two miles, over the Boer railway, the charge is at the rate of 41 cents per 100 pounds.

THE output of the mines of the Rand in South Africa for February was 211,000 ounces. With the exception of September, 1896, this is the largest output recorded. The yield since June of last year each month has been monthly over 200,000 ounces and never before that excepting in one month reached that amount. While this would seem to show a healthy increase looking at the totals, a glance at the product of the individual mines will in some respects tell a different story. The claim that the mines would pay in depth as well as nearer the surface is not to be entirely borne out. That the total yield has kept up is due largely to the fact that new mines have been opened. No less than a dozen mines which produced no yield in September of last year have in February yielded some 25,000 ounces. At the same time seventeen of the smaller mines which in September, 1896, produced 37,608 ounces yielded in February nothing. This is a large number in a total of sixty-eight to be closed down in the short space of six months. Yet it must be remembered that there can be no question of the presence of proved ore deposits that while not of high grade are of such extent and size that with economical management and worked on a large scale will profitably produce a great deal of gold for many years to come. That the Rand will continue for many years to be one of the world's great sources of gold cannot be questioned, but whether the annual output will be greater or somewhat less in the near future has not been determined.

THE Exploration Company of London, at the head of which is Hamilton Smith, who first made his reputation as an engineer in California, and which is backed by the Rothschilds, is not in itself a heavy investor in mines, as is popularly supposed. The company was formed about fifteen years ago for the purpose of examining and managing mines for others—syndicates or capitalists who desired the services of engineers. Since then hundreds of millions' worth of properties have been examined, opened, operated and, on their recommendation, placed on the London market. These include the Kimberley diamond mines, many of the largest properties in Africa, mines in Australia, Spain, Russia, and in fact in all parts of the world. Many of these properties are still managed by the Exploration Company for the owners, such as the Treadwell mines of Alaska, the Anaconda properties in Montana, the Tomboy in Colorado, the Helena & Frisco in Idaho, the Oneida in Amador county, Cal., and many of the largest mines of the Rand in South Africa. Lately, upon their reports, electric railroads in Paris and underground roads in London have been exploited by English capital. Some six months ago two similar concerns under practically the same management, the Transvaal and General Association and the Western Australia and General Association, were amalgamated with the Exploration Company, and at the annual meeting in London of the new Exploration Company last month it was announced that the profits for six months were £124,945, and a dividend of £110,000, or about 20 per cent, was declared.

Practical Notes on Hydraulic Mining.*

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE H. EVANS, C.E., M.E., General Manager Cons. G. Mines of Cal., Ld., Oroville, Cal.

Of the various kinds of mining there are none more interesting than hydraulic mining, and in connection with it there are innumerable points on which a mine manager or superintendent should be thoroughly posted, some of the most important being as follows :

First—Water facilities and the different methods of both roughly and accurately measuring the average amount of water available the season through for working the claim or claims.

Second—The nature of country through which the ditches, flumes and pipe lines have to be constructed in order to carry water for mining purposes, and the different grades suitable for such purpose. This is most important. The writer knows instances where ditches have been constructed for long distances with too heavy a grade, and consequently the water when turned in acquired too much velocity and completely washed away the greater portion of the ditch. On the other hand, by the employment of cheap or incompetent men, ditches have been constructed with too little grade, and there are cases where men have constructed ditches with the fall in the wrong direction.

Third—The quantity of water different size pipes will carry or that can be discharged through pipes and nozzles under various heads.

Fourth—The friction caused by using pipes of too small diameter, and the loss of head due to this; also loss of head due to bends of short radius, and angles of all kinds in pipe lines.

Fifth—A full and complete practical knowledge of the different motors used in connection with hydraulic mining, and all particulars relative to the efficiency of the various kinds of water wheels, etc.

Sixth—The strength of materials, and especially of chains, hemp and wire rope.

Seventh—The bursting and working strain of iron and steel pipes of different diameters, and the strength of iron and steel plates, single and double-riveted, with punched and drilled holes.

Eighth—Methods of economically treating alluvial deposits in large quantities, when there is not sufficient grade for ground sluices, and yet enough water for piping, or in cases where, owing to the debris law, it is necessary to impound the tailings.

Water Facilities.—This is one of the most important matters in connection with hydraulic mining, and great care should be taken in arriving at the average quantity of water available all the year round, or during the entire season, so that sluicing operations can be carried on continuously. In order to do this it is necessary to correctly measure the creeks, or streams, at different points, to fairly approximate the average supply of water that can safely be relied upon from such source, not forgetting that, according to the location, allowance must be made for loss due to evaporation and leakage, which in some cases reaches as high as 20 per cent.

A very simple method of measuring the quantity of water flowing in a stream is as follows: Measure the depth of water in feet, at from six to twelve points across the stream at equal distances; do this in two or three places along a fairly straight course; add all depths together, and divide the result by the number of measurements taken; this will give the average depth of the stream, and such depth multiplied by the average width in feet will give its cross section, or area in square feet, which, multiplied by the velocity of water in feet per minute, will give the number of cubic feet flowing per minute in the stream.

To find the velocity, a very simple way is to step or measure off 120 feet along the bank, and in order to allow for the surface of the water flowing faster than the bottom or sides, and thus obtain the mean velocity, call the measurement 100 feet, and at the commencement of this 100 feet throw into the middle of the stream several pieces of paper or wood at intervals, and note the time it takes each one of them to reach the end of the measured line; then divide the total time in minutes taken by all the floats by the number of floats, and the result will be the average time taken for each float to make the trip; divide the average time in minutes by the distance in feet, viz., 100, and the result will be the velocity in feet per minute, and this multiplied by the area in square feet will give the number of cubic feet flowing per minute; or, if the answer be required in miners' inches, multiply the cubic feet per minute by 2 and divide by 3.

Another simple method for small streams is to put a small dam across the stream and back up the water sufficiently deep to prevent any considerable velocity, and on top of the dam place a thin board with a notch cut out of it wide enough, by estimation, to carry the whole of the water with a moderate depth of overflow, and the following calculation will give the number of gallons discharged per minute, and this result divided by 11.25 will convert the gallons per minute to miners' inches. For example: A weir with 4 inches overflowing the length of a notch which is 6 feet, or 72 inches, wide, the number of gallons per minute would be found by the following formula:

$$G = d \times \sqrt{d} \times 1 \times 2.67.$$

Where G represents gallons per minute, d = depth of overflow in inches and 1 = length of notch in inches. In this case G will be found by multiplying 4 by the square root of 4, and by the length of notch or 72 inches, and then by 2 67, making the quantity of water in gallons per minute = 1538, and this divided by 11.25 = 136.71 miners' inches.

There are many other and more correct methods of measuring the flow of water in channels and streams, but I have illustrated the two most simple, in order that any person of ordinary intelligence could easily determine the quantity of water running in open streams without the aid of difficult formulæ.

Nature of Country for Grades, etc.—The nature of the country through which it is intended to carry ditches or flumes must be carefully considered in order to establish the correct grade, upon which, of course, depends the velocity, or, more plainly speaking, the destroying force of the water, and in locating the sites for water races the following points should be carefully considered:

First—Ascertain by careful aneroid readings the lowest point in the stream, creek or other source of water supply that will allow sufficient grade for conveying the water to a point suitable for working the claim or claims, and if the maximum supply obtainable is less than required for advantageous working, then favorable sites must be located for the construction of storage dams or reservoirs capable of storing sufficient to keep up the required supply.

Second—Should the lowest point in the stream, creek or other source of water supply contain more than enough to meet the requirements of the mine or mines, in driest season, then the locator should select the greatest elevation that the country through which the ditch has to be constructed, and the water supply available at driest season will allow, so that the ditch when completed will command the largest area of mining ground with the maximum head or pressure. This is an important point, as in many instances ditches of considerable length have been constructed and much money wasted in the endeavor to command large tracts of mining ground, and when such ditches have been completed it was found that they tapped the source of supply at such an elevation that it was impossible, except in the wet season to get sufficient water to wash with.

Third—All timber work along the line of ditch should be curtailed as much as possible, and when fluming cannot be avoided the use of iron or steel should be carefully considered for ditches of a permanent nature, as in many instances the first cost is not very much greater, but the durability and the great saving in cost of maintaining more than compensates the owner of the ditch.

When timber work is found necessary, care should be taken in securing the most durable kinds, and after flumes and supports are finished they should be thoroughly coated with a hot mixture of asphaltum, or painted with a good mineral paint, while all foundations for trestles, etc., should be placed in such a manner that they can be easily removed and renewed at all times.

Fourth—The line of the ditch should be carefully laid out so that it will be as short as possible, with, of course, due regard to economy etc., and in coming around long points or in places where sidelings are very steep and composed of loose rock, tunneling through such spurs should be carefully considered, or when it is proved by boring that such tunnels can be constructed to stand without timbering, they should always be preferred to long ditches around such spurs or points, unless the ground for ditching is exceedingly good and the extra distance quite short.

Fifth—Along the line of ditch all springs or water courses should be connected by means of short flumes or ditches, so that the loss due to leaks and evaporation from the main supply will be entirely or partly made up. It is also absolutely necessary for the safety of the ditch that by-washes or water gates be constructed for the purpose of taking care of any sudden increase of water from heavy rains or melting snow along the line of ditch.

These by-washes must be kept in condition to at all times divert any water above the usual height over the gates or through the openings in the sides of the race, and in locating the points for by-washes, or safety outlets, it is necessary to carefully consider what becomes of the surplus water, as in many cases owners of ditches have rendered themselves liable for heavy damages.

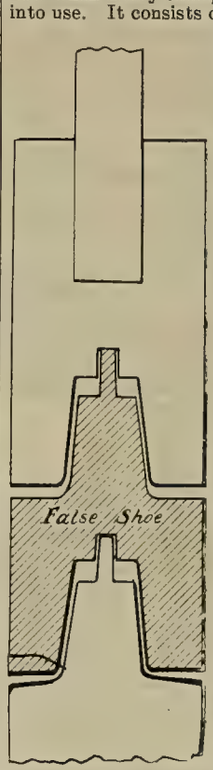
Sixth—At the different points along the line of race when fluming has to be resorted to, allowance should be made for an increase of grade, in order that the flume can be constructed of much smaller dimensions than the ditch and yet carry all the water required.

While on this subject, it is necessary to remember that the least amount of friction in ditches and flumes is developed when the least wetted border, or perimeter, is obtained, and to do this the width of the bottom must be from $1\frac{3}{4}$ to $2\frac{1}{4}$ times the depth of the sides. These two points, if carefully studied, will save ditch owners large sums of money in both lumber and construction accounts.

The following is a simple rule for finding the height of the sides of a ditch or flume when area of same is known, and it is desirable to follow the rule just mentioned above:

When width is to be $2\frac{1}{4}$ times the height of the sides, multiply the area in square inches by 4 and divide the result by 9, then take the square root of the product and that will be the height of the sides.

When the width is to be $1\frac{3}{4}$ times the height of the sides, multiply the area in square inches by 4 and divide by 7, then extract the square root of the product and the answer will be the height of the sides.



Seventh—It is agreed by the best authorities that, when constructing tunnels, where they will stand without timbers, the best form of roof is the Gothic arch, as it stands better than the circular or any other kind of roof and is not so liable to flake. In fact, tunnels constructed with circular roof, except in very tight ground, have been noticed to flake off until they assume nearly the section of the Gothic arch.

A New Quartz Stamp.

Richard A. Parker, consulting engineer of the California Exploration Company, has called the attention of the MINING AND SCIENTIFIC PRESS to an improvement in stamps that should be of interest to owners of quartz mills in California, particularly now when heavy stamps are coming more and more into use. It consists of a false shoe to be inserted in the boss as the crushing shoe wears down, and is illustrated by the accompanying cut.

This false shoe was invented for the purpose of keeping the stamp to practically its normal weight as the crushing shoe is worn down. It is made as is the ordinary shoe, with a recess in its bottom the same as the recess in the boss. This, if inserted as the shoe wears down, will maintain the uniformity of the weight of the stamp and consequently maintain the uniformity of crushing, besides allowing an additional amount of wear from the worn shoe. This, however, introduces another feature and demands that the mortar boxes shall be made high enough to permit the insertion of the false shoes, and provision must be made for this accordingly.

Mr. Parker, while in South Africa in charge of some of the large properties of the Consolidated Gold Fields, Limited, made practical tests of these false shoes in mills erected there, and, he states, with very satisfactory results. Speaking of this, he says:

"Stamp milling on the Rand must be regarded in a different light from that of other places or other countries; there it is essentially a crushing machine and its usefulness is dependent upon its ability to pulverize the ore fine enough to liberate the gold and prepare the ore for chemical treatment. Elsewhere the primary object is to amalgamate the ore in the mortar; but the two objects are in a measure opposed to each other. The usual weight of the stamp is 950 to 1050 pounds, and as high as five and a quarter tons per day of blue ore is crushed by the latter weight stamp. To increase the weight of the stamp necessitates an increased area of wearing parts. A 9-inch die used with a 1050-pound stamp has $63\frac{3}{10}$ square inches area of wearing surface. If the weight of the stamp is increased this wearing area should be increased, and the proportionate area for a 1250-pound stamp is 84 square inches, which corresponds to $10\frac{3}{8}$ inches in diameter for the die.

"One thing that is notable in South Africa is the fact that the shoes are made much deeper there than here, in order that a smaller proportion of metal may be thrown away when the shoe is worn out. The advantage of using a false shoe, therefore, becomes much more important in cases where deep shoes are used. All over California there has been an increase of late in the depth of shoes. Mill men are beginning to realize the fact that stamps should be heavier than those used ten years ago.

"So far as my knowledge goes, the ultimate end of all our milling work is going to be confined very largely to the question of crushing. It certainly was so in South Africa, and I see no critical difference between what would constitute good practice there and here. Stamps weighing on an average 800 pounds in South Africa have been replaced by

those weighing 1000 pounds, and in many cases up to 1250 pounds.

"Of course, the question of crushing is a function of the mortar and stamp and shoe and die; and in the mortar of late years the tendency has been to reduce its size so as to keep the pulp upon the dies. In Colorado there are extreme cases where it has been found necessary to amalgamate as far as possible in the mortars, and, as has been shown by Mr. Rickard, there are in use 600-pound stamps which drop 16 inches thirty times a minute. The crushing capacity of such a plant is necessarily limited; and as you pass through the various stages of heavier stamps with an increasing number of drops per minute you finally reach the present modern practice of 1250-pound stamps dropping 8½ inches from ninety-two to ninety-five times per minute. With ample plate surface—which is of the utmost importance—the question of amalgamation in the mortars does not become so essential in the majority of ores found in California mines. The greater the crushing capacity, of course, the less the cost."

The Marble Belt.

Written for the MINING AND SCIENTIFIC PRESS by A. THURSTON HEYDON.

There are many lenses or segregated bodies of limestone in the Calaveras formation upon the west slope of the Sierra Nevadas. These lenses run all the way from an exceedingly impure limestone to as fine a quality of marble as there is to be found in the State. What is locally known in Amador and El Dorado counties as the marble belt is a series of lenses of crystalline limestone extending from above Fairplay, upon the middle fork of the Cosumnes river in El Dorado county, to Volcano in Amador county. These lenses are exposed to view at the middle fork of the Cosumnes, at the old mining town of Brownsville (otherwise known as Mendon), at Indian Diggings, at Dry Creek and at Volcano. Much of this marble is of such a fine quality that lack of transportation is all that prevents it from being commercially valuable. At Volcano and Indian Diggings attempts were made to quarry it, but the cost of transportation made them failures.

Although the marble as marble was an unavailable source of wealth, and in itself contained no gold, still the marble belt has been and is of great interest to gravel miners. This is because in and around the various lenses were and are large deposits of exceedingly rich gravel. These gravels were so rich that from 15 to 20 feet square constituted a claim, and from these small areas gold was taken out by the tens of thousands of dollars. On account of their manner of formation these deposits have never been exhausted, although Volcano has been worked continuously ever since the early '50s.

The Formation of the Gravel Deposits.—Water has a solvent power upon lime. The great caverns in limestone were formed by the waters dissolving and carrying away the lime atom by atom. For this reason the waters gradually cut large irregular basins in the marble wherever opportunity offered, and filled them with gold-bearing gravels. The process of cutting out and filling in proceeded simultaneously and extended over a great space of time, as the waters gradually dissolved the marble underneath, allowing the gravel to sink and giving room for the deposition of fresh gravel on top. The slowness of the process allowed a greater concentration of the precious metals and accounts in part for the great richness of the gravels in the marble belt.

After the underlying gravels were deposited came the various rhyolitic or aqueous lava flows which partially filled the then existing channels. As the gulches were not quite filled the streams cut secondary channels, known as cement channels, in the soft rhyolites or chalk lavas, and filled them with gold-bearing gravels of varying value. Subsequent fragmental lava flows and showers of volcanic ash filled the gulches, covered the country and necessitated the cutting of a new drainage system.

With the exception of the middle fork, the places mentioned were formed in the days gone by, but there the process of formation is still going on in the bed of the river.

The Character of the Gravel.—The gravel is to quite a large extent a fine quality of quartz, often sprinkled with gold, mixed with blue gravel and iron, which occurs both as a limonite and a magnetite. The iron is often found in masses of several hundred weight. In addition to these are the various petrifications and reformations characteristic of the marble belt. These, especially the chalcedonies, are often very beautiful, and if within reach of a market would be valuable for mosaic and other ornamental stone work. The gravel is slightly cemented, just enough to hold the gold, and it falls apart as soon as touched by running water.

The Past Work.—In order to fully appreciate these peculiar deposits and comprehend the amount of work which has been done in the various camps upon this belt, it is necessary to visit them in person and spend months in unraveling their peculiarities. Such time is not wasted, for they, as well as their inhabitants, are very interesting studies. As long as the deposits were easily accessible the various diggings were redhot mining camps. Everybody had money and was anxious to spend it. The majority succeeded.

When the camps became hydraulic propositions they were no longer run at such a high pressure, although they were still prosperous, and continued so until the unjust anti-debris law put an end to further operations. Since then, outside of Volcano, but little has been done, with the exception of the gophering done by a few '49 spring of '50s.

None of the various camps have been worked out. The middle fork requires more machinery and better directed effort than has yet been expended upon it, which is to quite an extent true of all the other places. Hydraulic elevators and ejectors are the solution of the problem of working the deep ground. At Brownsville, outside of a few points of marble, no bedrock has yet been struck. Although unquestionably rich, this deposit is an exceedingly difficult one to work successfully without a consolidation of several properties and a large working capital.

Indian Diggings was a wide-open mining camp in the early days, and polled 600 votes in '56. Its largest deposit of gravel, which is over 150 feet in thickness and prospects evenly and well throughout its whole thickness, is owned by the Plymouth Consolidated Company, and is lying idle because of the fear that after the required $75,000 is expended in opening it up the anti-debris forces might succeed in closing it down. Outside of this, there are a number of other properties which, if reopened and properly equipped, would yield rich returns upon the investment, for there is as good gravel remaining as was worked; besides, but little bedrock has been cleaned, but that which was immensely rich. There is no better recommendation for the remaining gravel than the fact that Indian Diggings was one of the two most famous places upon the marble belt.

At Dry Creek the conditions were not as favorable for the formation of the rich gravel deposits which made Volcano and Indian Diggings so noted.

With its surrounding gulches, whose yield was simply phenomenal, its Hell's Half Acre, and enormously rich gravel deposits in its marble basins, Volcano was the most noted of all the camps upon the marble belt. When the easily accessible deposits were worked out an expensive tunnel and tailrace were blasted out of the solid rock for an outlet. Although there is a great deal of gold remaining here still, this section does not offer the same inducements and openings for enterprise and capital as the more northern portion of the marble belt.

New Mexican Miners' Association.

The following letter referring to an item quoted from a New Mexican paper in the MINING AND SCIENTIFIC PRESS of March 20th is self-explanatory:

We note in your issue of the 20th inst. mention of the organization here on the 18th inst. of the New Mexico Miners' Association, which adopted the by-laws and constitution of the California Miners' Association. F. A. Reynolds of Chloride, N. M.; Antonio Joseph of Taos, N. M., and James H. Purdy of Santa Fe, N. M., being elected president, vice-president and treasurer, respectively. That mention adds erroneously: "It was stated that the object is to unite mine owners and capitalists interested in New Mexico against the Western Federation of Miners, which has so long flourished at Leadville, Cripple Creek and other camps in Colorado."

Will you, by publishing this denial, please correct the error so made. It is not true that any such statement was made at that organization by any one or in any manner as to the objects of our association, or otherwise. The Western Federation of Miners was not mentioned or referred to. The New Mexico Miners' Association is organized for the following purposes, which are set out in the articles of incorporation as article II thereof, as follows:

Article II—Objects. "The objects for which this association is formed are: To develop, foster and protect the mining industry of the Territory of New Mexico, and to those ends to obtain all desirable information of the location, extent and character of the mineral resources of this Territory, and to make that information widely known at home and abroad; also, to obtain all attainable scientific and reliable desirable information, especially the latest, pertaining to mines and mining, and to the means and methods most approved for their development, and similar information of the methods of treatment of the mineral-bearing ores, and to diffuse as widely as practicable the information so obtained; also, to promote intercourse between those friendly to the mining interests in New Mexico by meetings and otherwise."

F. A. REYNOLDS, Pres. N. M. M. A.
JAMES H. PURDY, Sec.
Santa Fe, N. M., March 30, 1897.

British Columbia Minister of Mines' Report.

The annual report of the Minister of Mines of British Columbia for the year ending December 31, 1896, has been received. This promptness in publishing reports so that they may be of practical value might well be universally initiated. All the work done seems to have been timely and of a nature to be of most value to the industry. The total production of minerals for all years up to the end of 1896 is given in the following table:

Gold, placer	$ 57,704,855
Gold, lode	2,177,869
Silver	1,028,224
Lead	1,606,427
Copper	254,802
Coal and Coke	33,934,427
Building Stone, Bricks, etc.	1,300,000
Other Metals	25,000
Total	$100,931,604

The following table gives a detailed statement of the amount and value of the different mine products for 1895 and 1896, but it has as yet been impossible to collect statistics concerning the amount of building stone, brick, lime, fire-clay, tiles, etc. The increase in the value of the precious metals produced, and the baser metals, especially of lead, is marked, and the total increase for 1896 over 1895 was from $2,834,000 to $4,816,000.

PRODUCT.	1895. Quantity	1895. Value.	1896. Quantity	1896. Value.
Gold, placer, ozs	24,084	$ 481,683	27,201	$ 544,026
Gold, quartz, ozs	39,264	785,271	62,259	1,244,180
Silver, ozs	1,496,522	977,229	3,135,343	2,100,680
Copper, lbs	952,840	47,642	3,818,556	190,926
Lead, lbs	16,475,464	532,255	24,199,977	721,384
Coal, tons	939,654	2,818,962	846,235	2,327,145
Coke, tons	432	2,269	615	3,075
Other materials		10,000		15,000
Totals		$5,655,302		$7,146,425

PRODUCTION OF METALS PER DISTRICT.

DISTRICT.	1895.	1896.
Cariboo	$ 282,400	$ 384,050
Cassiar	22,575	21,000
Kootenay, East	17,575	154,427
Kootenay, West	2,223,206	4,002,735
Lillooet	40,663	33,665
Yale	241,581	206,078
Other districts	10,000	15,000
Totals	$2,838,000	$4,816,955

The gold output is now beginning to steadily rise as the operations of the large hydraulic mining companies in Cariboo begin to assume such a scale, that with larger water supplies and the mines more opened out for work, a much larger amount of ground can be washed.

The next table shows very clearly the fact that lode mining in this Province has just fairly begun, and that the progress now being made is decided and very satisfactory.

The gold production of course consists mostly of the output of Rossland mines as per smelter returns, but there are added the gold saved by amalgamation in the Oeoyoos district as at Camp McKinney, in the Nelson district as at the Poorman mine, and the product of small lots of gold ore sent out to the the smelters from other parts.

Some silver ore is known to have been sold prior to 1887, but no record has been obtained regarding these small sales.

PRODUCTION OF LODE MINES IN BRITISH COLUMBIA.

YEAR	GOLD. Ounces.	GOLD. Value.	SILVER. Ounces.	SILVER. Value.	LEAD. Pounds.	LEAD. Value.	COPPER. Pounds.	COPPER. Value.	Total Values.
1887			17,690	$ 17,331					$ 17,331
1888			79,780	75,000					75,000
1889			53,192	47,873					47,873
1890			70,427	73,948	113,000	5,805			79,753
1891			4,500	4,000	588,665	25,607			29,607
1892			77,160	66,935	1,768,420	72,505			139,440
1893	1,170	23,404	227,000	195,000	2,135,023	78,996			297,400
1894	6,252	125,014	746,379	470,219	5,662,523	169,875	324,680	16,234	781,342
1895	39,264	785,271	1,496,522	977,229	16,475,464	532,255	952,840	47,642	2,342,397
1896	62,259	1,244,180	3,135,343	2,100,689	24,199,977	721,384	3,818,556	190,926	4,275,179
Totals	108,945	$2,177,869	5,907,993	$4,028,224	50,943,072	$1,606,427	5,096,076	$254,802	$8,067,322

Reports in detail are made upon the different districts by capable assistants. These have been noted and quoted from in the MINING AND SCIENTIFIC PRESS as they appeared during the latter part of last year.

The Bureau of Mines was organized January 1, 1896, and will have its offices, laboratories and library in the new Government buildings when they are completed. In addition to the work of examining and reporting upon the mines of the Province and maintaining a laboratory for determining minerals, it is proposed to maintain student laboratories for instruction in assaying, blowpiping, mineralogy, geology, etc., and to establish and equip a plant for testing, metallurgically, the different kinds of ore, coal, coke, etc.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: Mr. Dillon, the superintendent of the Robinson mine, has determined to put up roller mills to ultimately extend to the capacity of 100 stamps.

At the Baliol mine the 40-stamp mill is crushing night and day up to its fullest capacity. New tunnels are being opened up, but the entire force of men on the payroll numbers only thirty-eight. Half a dozen men or even less keep the ore bins constantly filled and the 40-stamp mill crushing day and night.

At the McMahon mine as soon as the machinery can be put in the shaft is to be sunk until it taps the ledge at a supposed increased depth of about 130 or 140 feet. If this work results in showing a satisfactory character of ledge matter, the intention is to sink another and larger shaft to the eastward to tap the ledge at a greater depth.

Dispatch: In the Jackson Gate they are crosscutting to strike the east ledge; but as the rock is very hard they are making rather slow progress.

On the Good Hope stations are being opened and levels have been started at a depth of 115 feet. There is a 10 stamp mill at this mine which has been started up north and south along the ledge and good ore is being taken out.

Republican: At the Alma the east drift at the 1000-foot level has penetrated ledge matter a distance of 30 feet. The quartz prospects free gold by ordinary miner's pan test. The ore is considerably broken up, and while the distance between walls shows the existence of a true fissure vein, it may be that drifting north and south will be necessary to encounter the well-defined ore body.

At the Oneida the shaft is down 820 feet, and sinking will be continued until a depth of 1500 has been reached. The new hoist has been put into service and the old hoist removed.

Butte.

Mercury: The machinery in the Carlisle mine will be started up this week. Ten men will be employed to begin with.

The Jersey Blue mine, on Ohio flat, shows a ledge of 5 feet, with excellent ore in sight.

Calaveras.

Mountain Echo: The Rosehill gravel claim, in El Dorado mining district, formerly owned by the Rodoscino heirs, has been sold. Surveyors have surveyed the ground, and preparations are now being made to hydraulic the gravel. The new management will lay 10,000 feet of pipe and begin operations at once with a large force of men.

The Martin mine has been purchased by G. W. McNear of San Francisco. The claim is now being worked by water power, but heretofore it was operated by steam. Mr. McNear worked this mine in the month of January with a force of fifteen men, but has since increased the working force.

A San Jose company, through the agency of Mr. E. W. Hayden, has purchased the Gaston hill drift mine, in El Dorado mining district for $12,000. The company will commence work about the 1st of April.

The Ponte talc mine in San Domingo district has been bonded to a Los Angeles company whose expert was up the other day to inspect the property. A tunnel is being run to tap the vein at a depth of 100 feet.

Prospect: A rich strike has been made in the Blood mine at Collierville during the past week. An opening 6 feet wide, with a vein on one side varying from 8 to 12 inches has been encountered and the rock is of high grade. Prospecting work is being done at the Zigler mine, on the hill between the Gold Cliff and Utica mines, with results very encouraging to the owners. A tunnel 180 feet in length has been run along the vein, showing an immense body of ore, the exact width of which is not yet known, but it is believed that it will average from 25 to 40 feet.

Mr. Higgins, manager for the company who are developing the Ponte mine across the San Domingo, has completed his tunnel which taps the lode at about 75 feet. The rock found is filled with sulphurets and is of a low grade.

Citizen: William Drown has organized a company at San Francisco to develop his mine at Angels Camp.

The Nap mine, west of North Branch is being prospected by A. C. Van Meter.

At the Gwin mine work is going steadily on at the 1300 and 1400-foot levels. The face of the north drift is 238 feet from the shaft, and the face of the south drift is 250 feet away. They are taking out some fine quartz, and the mill is crushing about 110 tons a day. During March 3500 tons of rock were put through the mill.

An 8-foot gold-bearing ledge has been discovered at the Bald Hill mine about 200 feet from the old shaft.

El Dorado.

(Special Correspondence).—The drift on the 350 level of the Septimus Development Company's mine has reached 500 feet. It is expected that 50 feet additional will reach the Robinson chute, which five years ago produced good ore.

The tunnel through the Mierson Consolidated property, by which it is calculated to tap the Lloyd ledge at 450 feet, has been driven 175 feet. The work on this property is doue by power drills and is moving rapidly.

The north drift on the Empress Josephine is 35 feet in a good body of ore.

The Salisbury mine, a corporation in which A. W. Longley of Chicago was the largest shareholder, because of default in paying the April installment, has reverted to D. H. Jackson.

In the Darrow mine the tunnel to the lead is 240 feet. The drift on the lead is 700 feet. Crosscutting has been started. Thus far the ledge is found to be 40 feet. The ore is low grade. The footwall is said to be talc and the hanging a species of schist.

The Point Lookout mine has a tunnel 100 feet on the ledge, from the center of which a shaft has reached 20 feet on ledge matter. The walls have not yet been found. The whole hill, from the grass roots, seems a milling proposition, and the ore averages $10 in free gold, with 5 per cent sulphurets that run from $50 to $150 per ton. The formation is locally known as quartzite. The property has a 4-stamp mill in operation, to which the ore is carted one-half mile.

The several properties owned by I. C. Heald at Nashville are receiving the attention of Eastern people. They are all mother lode veins, said to lie in the center of the belt.

Considerable prospecting is being done in the old Kanaka district in the vicinity of the confluence of Weber creek and the south fork of the American river.

The demand for gravel properties in this mother county of rich placer diggings is growing steadily and a few of large dimensions are about to change hands. Some of these are milling and others of a hydraulic nature. The hydraulic elevator will also come into use.

The tunnel on the Boulder mine last week had reached 548 feet. It is thought that at 30 feet farther the ledge will be tapped. This is said to be a fissure vein in the contact. A 10-stamp mill is completed on the property.

The depth attained in the Big Canyon mine is 900 feet, but water impedes work at that point. Ore is being milled at present from the 300 level.

A custom mill is among the recent achievements of an enterprising citizen of this place. The machinery will be in operation within a few days.

There is a superabundance of idle laborers hereabouts. Mining men coming here for work will be disappointed, and the outlook for employment is not growing to any encouraging extent for those already here.

Placerville, April 5th, '97.

Kern.

Los Angeles *Times*: At Randsburg some rich strikes have been made recently. A. Matheson in the Marvel mine, beyond the Stringer district, struck a pocket of ore on Friday last.

In the Reedly mine, Jenkins, owner, some rich ore has been found. This mine lies northwest towards the valley.

The Minnehaha, one and a half miles southwest, owned by Maginnis, Hanson and O'Leary, is showing up well. They are sinking a double compartment shaft and have a vein of ore running from 2 to 4 feet.

The owners of the G. B., on the Kramer road, have milled ninety tons recently which went $20 per ton. The vein of ore runs from 2 to 4½ feet and is easily worked.

Los Angeles.

For many years the part of Lytle creek between Santa Barbara and the mountain source has been successfully worked for gold. The recent find of a $50 nugget gave a renewed zest to the work, but the prospectors had not given the quartz along the creek much attention until a firm of Los Angeles capitalists commenced last October to drive a tunnel into the hillside. It is now in 100 feet and the workmen are in a ledge of gold-bearing quartz that assays very high.

Mariposa.

Capt. H. H. Todd, who bonded the Quartz Mountain properties near the junction of the North Fork and Merced mines in Mariposa last October is, with Capt. A. H. Ward, about to begin their development, and buildings are being erected. There are immense deposits of low-grade ore in cases 100 feet wide, over 2000 feet in length, with strong feeders running in. With the cheap water supply available, and facilities for working through tunnels, the ore can be worked very cheaply.

Arc Light: Sinking has been resumed in the Great Western mine, owned by Frank Baumbogger. The shaft in this mine is being sunk in good ore.

At the Tryon mine the working shaft has reached a depth of 200 feet, and a drift has been run through a solid body of ore more than 26 feet, and the end is not yet. Tests of this ore body have proved satisfactory to the company. Sinking has again been resumed, and will be continued to a depth of perhaps 600 feet.

Gazette: Pinon Blanco mine, owned by Capt. A. H. Ward has been bonded to the Iron Mountain Mine Company of Colorado. The first payment has been made. The company expects by the first of May to have a full force of men at work developing the mine. Surveys are being made for further plants.

The Virginia mine, belonging to D. O. Toole, has been bonded by the California Exploration Company. Their engineer, R. A. Parker, has put a force of men to work sinking a shaft and clearing the old tunnel, and will in a short time consider the erection of a 20 stamp mill it develops well.

Nevada.

Transcript: The prospects in the El Capitan lower tunnel, at Washington, are encouraging. It looks as if there would be as great a shoot of ore as in the Giant King and Queen, both being in the same fissure and contact sister shoots.

The Giant Queen mine, south extension of the Giant King, has been bonded to parties with capital, who propose to open up and develop the property.

Union: The Bullion shaft is now down 830 feet and drifts are being run both ways. The ore is being crushed at the Omaha mill, and that from the No. 2 level is of good milling quality.

Telegraph: In the Omaha there is every prospect of a continuation of pay ore. It is the present intention to sink an incline shaft on the newly purchased ground.

The Brunswick mine has for a long time been contending with a stream of water which is under control by the 10-inch plunger pump in the bottom of the mine.

San Diego.

Union: The Glen Cliff Mining Company resumed work on its mines two weeks ago. A shipment of ore, has been made which justifies an additional force of men.

The Owens mine at Julian is to have its main shaft deepened 200 feet, making the shaft 550 feet in depth.

A new mining enterprise has been started in the Chihuahua district, northeast of Oak Grove and near the dividing line of San Diego and Riverside counties. Several of the claims are owned by Los Angeles men, who have secured mill sites and water rights and are preparing to put up a 10-stamp mill. There is a 90-foot shaft on one claim in the district, and the development work that has been done shows a promising vein of ore. Very good assays are obtained from the surface rock.

Placer.

Colfax *Sentinel*: At the Drummond mine the new lower tunnel is now in about 400 feet. Power drills are used and two shifts of three men each are making about 40 feet per week The tunnel will be run 1200 feet in all. This tunnel will tap the ledge 500 feet below the tunnel.

The Central gravel mine, at Deadwood, recently purchased by J. O. Whitney, has six men engaged on development work. A larger force of men will be put on this spring.

Shasta.

Searchlight: The Safe Deposit mine on Spring creek, owned by Stump, Foster, Fitzpatrick & Lilly, was bonded last week to George Senn, who will at once put on a force of men to push development and if the properties come up to expectations will close the deal by the payment of $30,000 at the expiration of the bond in ninety days.

Dale & Dawson made a shipment of ore from their mine on Little Churn creek to the smelters at Keswick last Tuesday which returned over $56 to the ton. The ledge from which the ore is taken averages about 14 inches in width.

Quite a number of persons in that vicinity are engaged in shipping and delivering "bull quartz" to the Keswick smelters where it is used as flux.

Geo. Vestal and his associates have uncovered a very rich ledge near Horsetown.

President Schmitt and Superintendent Rahn of the National Consolidated have closed a contract for 50 H. P. from the Spring Creek Electric Power Company and will hereafter run their mill, hoists, etc., with electricity.

A road has just been completed from the Garfield, Logan and Mt. Shasta claims one mile away. Rock is now being broken on these properties and hauled to the mill. These upper claims have been developed by means of three tunnels; the lowest cutting the ledge at a depth of about 200 feet and showing 5 to 6 feet of good ore.

The Reid group of mines in Old Diggin's are showing up well under development. The group is composed of six claims, and development at the greatest depth yet reached shows a 10-foot ledge of good quartz.

G. A. Von Krueze, superintendent of the Sybil group of mines, on the Deadwood-French Gulch divide, proposes to put in a 40-ton roller mill.

A great amount of good ore is at present on the dumps and in the bins. Twenty-two men are employed on development work. The lower tunnel is now in about 170 feet, but considerable distance will have to be covered before the objective point is reached.

The Crown Point Consolidated, having completed its new road to the mine, is now hauling ore to Redding for shipment to the Keswick smelter.

A. C. Hamilton, Harry Gorham and W. E. Lester, who with Senator J. H. Jones are interested in the bond on the Milkmaid mine at French gulch, were here from Virginia City the past week looking over their property interests.

Free Press: Dobrowsky and Bergh have let a contract to complete the development of their mining property near Shasta. They recently completed their lower tunnel, which is 185 feet in length and taps the ledge at a depth of 100 feet.

J. P. W. Davis, who owns the Washington mine on Whisky creek, has made a sale of the property for $3000 in three payments.

Siskiyou.

Journal: The Columbia quartz mine, near Scott river, sent a lot of bullion to Yreka last week. Eighteen men are employed getting out quartz to keep the mill running.

W. A. Chamberlain and Dr. A. J. Timmons, who own the extension of this ledge, the Mabel mine, intend to start up work soon for the summer season.

The cold weather lately has frozen up the water supply in the Salmon range, preventing the hydraulic miners of Quartz valley, Oro Fino, Mugginsville, and Scott valley from piping.

At the American Bar mine, Klamath river, they are now hoisting dirt. They employ about forty men and by reason of the machinery being geared up so much higher than the ordinary river derricks, they can handle about 300 tubs of dirt, each carrying from 1000 to 1200 lbs. in twenty-four hours, which is more than twice the amount the old plants can handle. The gravel in this mine pays well all the way down to bedrock.

The Boomer mine, near the Forks of Salmon, owned by Wm. Bennett, is now being worked with good results. Mr. Bennett also has a giant at his mine near his home on the Forks and one at the Crapo mine. The one now working on the Crapo will be removed to another piece of ground about two miles from the Forks of Salmon, containing about forty acres.

Several other hydraulic mines on the Salmon river are in operation, and are reported to be paying well.

There is some talk of again starting up the 20-stamp mill at the Gold Ball mine, near Sawyer's Bar. This property has been idle a long time.

News: The Klamath Flume & Mining Co. (The Big Four Company) are running a higher survey, starting at their tunnel site and carrying the line to the East Fork of Indian creek. They have four gangs of men at work drifting on their property near William Point to determine at what point their ground shall first be opened up. In May work will commence on their 1,000-foot tunnel and on the eleven-mile ditch and flume.

Tuolumne.

Union-Democrat: On the Rawhide the main shaft is being driven down towards the 1100, although sinking will not be discontinued until the 1300 is reached. Crosscutting, drifting and stoping on the 900 and 1000 levels goes on every shift in the 30-foot vein.

On the Rappahannock sinking has passed the 600-foot mark. When the depth amounts to 630 feet, crosscutting and drifting will be commenced on the 600, the extra 30 feet being for a sump. In the bottom of the shaft a 35-foot vein of good rock shows up, with very little water to contend with.

Independent: Sinking continues on the several shafts of the Tarantula steadily and the ore gives promise of a bonanza.

The Andy Johnson mine, at Chinese Camp, will open up again as soon as the engine is in place.

The Rappahannock is still sinking in its main shaft and good ore is being added to the dump.

The Gerrymander mine has unearthed another rich vein of ore.

Good rock was struck last week in the McKennie mine on the Parrot's Ferry road, two miles from Columbia.

Ventura.

Herald: The most authentic information from the Ojal gold fields is that many of the mine owners have consolidated their mining interests, money thus being secured to aid development. Two miles west of Nordhoff considerable low-grade ore has been found. Although a shaft is down only 3 feet, a well defined 2-foot lead has been found. The most flattering reports, however, come from the Big Six mine in Gridley canyon, located about five miles northeast of Nordhoff.

NEVADA.

Elko *Tidings*: Located about sixty miles north from Wells is the rapidly growing mining camp of Salmon. The district was located in 1872 by Hanks, Lewis and Noll, and for a time created great excitement among prospectors, but trouble in milling soon caused the excitement to die out and the camp to sink into oblivion. About two years ago the attention of mining men was again attracted to this district and several tons of gold and copper bearing rock were shipped to the smelters at Salt Lake City. Last year a large smelter was erected by Eastern capitalists and the camp commenced to grow and is still growing. During the winter months the smelter has been lying idle on account of the deep snow in this section and the poor condition of the roads leading to Wells, which prevented transportation. But several of the mines have been kept open all the winter, and when the snow will have disappeared and the roads have again become passable, there will be more than enough rock to run the furnaces for several months. At present there are about 200 men in the camp, living in rock houses and tents.

It is reported that the Magnolia mine at De Lamar, which is showing up finely, will shortly pass into the hands of the De Lamar Company.

Dayton *Times*: Nine tanks for the Davis leaching plant are being set up.

Widening and cleaning the Douglass ditch has been completed and the water turned. The ditch has been widened to 6 feet 6 inches at the bottom, and will carry water enough to furnish power to run the concentrating plant being put in. W. H. Peck has forty men employed at the mill building in Dayton. He expects to start up in less than thirty days, and will work about 300 tons daily. The supply consists of about 450,000 tons, the reduction of which will require at least two and one-half years. Chas. V. Peck will be the superintendent of the new concern.

Walker Lake *Bulletin*: Col. Sutherland spent several days in Candelaria last week. A lot of machinery, a sampling outfit of the Bailey process, is now at Belleville.

OREGON.

Jacksonville *Democratic Times*: Belding & Dowell of Green's creek will soon erect a stamp mill. They have several hundred tons of good ore on the dump.

G. W. Bailey has opened the old Mountain Lion mine on Missouri flat in a new place, and discovered a vein 18 inches wide which prospects well.

Six monitors are running at the Hampton-Lewis mines on Grave creek. A race 1200 feet long has just been completed, which is paved with railroad iron.

The Spokane parties who bonded the Boynton ledge on Jump-off-Joe for $3000 have found that the pay seam widens from its original 18 inches to 4 feet, and some of the rock assays high.

BRITISH COLUMBIA.

From the Slocan the Wonderful is working twenty-five men and the shipments from the mine amount to one-half car a day.

The Payne mine is now shipping sixty tons of ore daily. The Ruth is shipping thirty tons.

The Carbonate mineral claim has now passed wholly into the hands of Charles E. Caldwell of Kaslo, who recently purchased the remaining interests of Gay Reeder and D. E. Croft for $5000.

Galusha and Finch, the chief owners of the Jumbo mine at Rossland, have received a cablegram from the London interests holding the option on that mine asking for an exten-

sion of twenty days. They telegraphed in answer that it could be had for $5000 cash. The present option, which expired April 1st, cost the holders $3500.

Up to Saturday, March 27th, there has been shipped from the Rossland mines 13,940 tons, as follows: Le Roi, 9856 tons; War Eagle, 2447; Columbia & Kootenay, 455; Iron Mask, 707; Jumbo, 91; Josie, 126; Cliff, 61, Red Mountain, 56; O. K., 86; Evening Star, 21; Giant, 21; I. X. L., 12. The shipments from the O. K. were concentrates. During the period from January 14th to March 27th there were 1337 tons of ore milled at the O. K.

The Reco Mining and Milling Company, Limited, who are operating the Reco mine, near Sandon, intend to put up a double-rope aerial tramway and a 120 ton concentrator. In 1894, with six men, ore to the value of $7500 was taken out of this mine; in 1895, with from eight to twenty men, $41,787; last year, with fifty men, $62,073; and up to date this year $124,000. They ship a carload, or twenty tons, every two days, which brings in $4000 net profit. One carload cleared $10,000. The ore is produced from a lead which does not average more than 4 inches of clear ore.

UTAH.

Salt Lake *Tribune*: W. H. Donnell of the Sunbeam and Rabbit's Foot is negotiating with Wilson & McCormick for the purchase of the Geneva mine at Silver City.

The North Star group, consisting of ten claims, lying eighteen miles from Frisco, has been secured by Murray, Weigel & Cory.

Articles of incorporation have been filed of the Boston & Mercur Gold Company, formed by Boston and Salt Lake capitalists.

Bingham *Bulletin*: At the Nast mine the new owners will clean out the Bullion tunnel and probably resume work in the long drain tunnel begun three years ago near the mouth of Muddy gulch. This tunnel, if ever completed, will cover nearly 4000 feet. It will have a depth of about 650 feet below the tunnel level of the Nast.

Vadner & Frisbee have secured a bond and lease on the Argentine, paralleling the Zelnora on the west.

About 360,000 feet of lumber will be required for the Highland Boy mill building.

Tintic *Miner*: Work on the Independent-Tesora property has been suspended and the machinery has been transferred to the Treasure Leasing Company. The machinery is now being erected on the Valley claim, which is being worked by the latter company.

Work on the Eagle mine has been commenced under the direction of N. W. McChrystal.

Shipments for the week were as follows: From the Bullion-Beck mine, twenty carloads of ore; Bullion-Beck mill, ten carloads of concentrates; Humbug, three carloads of ore; North Star, two carloads of ore; Buckeye, one carload of ore; Dragon iron mine, two carloads of ore daily; Noon's iron mine, one carload of ore daily; Mammoth mill, seven carloads of concentrates; Sioux mill, two carloads of concentrates.

Park *Record*: At the Constellation mine the prospects are much better. The entire force of three shifts is drifting on the ledge, which is growing larger continually.

No date for the resumption of work at the Marsac mill has been agreed upon, nor is it likely to be until the return of Superintendent Chambers from San Francisco. The ore in the Marsac bins now is in the neighborhood of 900 tons.

IDAHO.

The Consolidated Tiger-Poorman mill at Burke is now treating a daily average of 230 tons of ore.

At the Frisco the first set of timbers has been placed in the new station on the 500-foot level. Sinking has been resumed in the shaft and it will be put down to the 800-foot point as rapidly as possible. Carpenters will be through with alterations in the mill about April 10, and will then begin on the new ore sorting room. The improvements now under way will cost about $200,000.

The Montana mine on Estes mountain has been sold and the first payment of $10,000 has been made. As soon as spring opens mining machinery men will be given an opportunity of figuring on a plant to treat the ore.

It now looks as though the Seven Devils mining district will be reached from Payette, instead of Weiser, as the former camp has succeeded in giving the largest bonus for the building of the road.

In the bottom of the shaft of the Banner mine—200 feet deep—they have cut into the largest body of ore yet found in this property.

Another strike in the Elkhorn has created considerable excitement. The ore body now exposed is 3 feet wide, of iron oxide quartz and the best grade. This property is three miles west of the Banner, at the head of Slate creek.

The management of the Lucky Boy Company will make some radical changes in its milling plant. The mill was originally erected to treat sulphuret ores. Thirteen hundred tons were run through a gold mill, with the result that 85 per cent of the gold was saved. Another lot was worked by raw pan amalgamaion and 85 per cent of the silver was saved. From these facts it is known that a combination mill with plates and pans will serve that purpose, while twice as much ore can be put through wet as by the process requiring it to be crushed dry. It is expected that the change will be completed about the first of June and the management hopes to produce during the year about $700,000.

MONTANA.

Mining and Railway Review: At Neihart the Diamond R. Mining Company will begin the erection of a 100-ton custom concentrator about May 1st, to be completed within sixty days. This company owns the Moulton and other good property at Neihart, all of which will be worked, and if successful other companies will put up concentrators.

The Galt mine at Neihart last week finished the upraise to the upper workings and is now ready for heavy development as soon as the company sees fit to put on a larger crew.

Inter-Mountain: There are now about 300 men at work in the Alice properties, including the lessees and tributors. The 60-stamp mill of the company is running regularly.

The Montana Mining and Milling Company, Limited (Drum Lummond), has begun work preliminary to building its cyanide plant. A force of men are putting in a switch from the Northern Pacific track below Marysville, which will run to the site of the plant. Over the switch will be hauled all the material for the plant, and in a few weeks actual construction, it is said, will be under way at the dam. The cyanide plant which the company will operate in the future will be one of the largest in this part of the West.

The old Liverpool mine in Lump gulch last summer was closed down for some time by its owners, the Merrill-Miller Mining Company, owing to the boarding-house trouble, which involved all three of the largest mines of the district. Several months later it was leased to Alex Swain of Helena, who reports that he has received returns from a shipment of ore from the 450-foot level of the mine which netted him 187 ounces of silver to the ton.

Thos. Ewing, manager Diamond Hill mine, is pushing the work at the mine as fast as possible. Seventy men are employed.

Manager Kelley, New Elkhorn Mining Co., reports 1175 tons ore raised during December. The result of the month's operations is as follows: Estimated value of bullion shipped, $24,755; surplus on November shipments, $569; net value of bullion, $25,324; returns from ore shipped, $6,324; total receipts, $31,550; current expenses, $25,280; profit for December, $6270.

Butte *Miner*: A lease has been granted by the Anaconda Company on the Grant Extension fraction to Swett & Metcalf, who are sinking a shaft from the surface. They have machinery on the ground to hoist from a depth of 500 feet. At the High Ore No. 1, a body of smelting ore 60 feet wide on the 1200-foot level is furnishing its quota of ore for the smelter. At the High Ore No. 2 the shaft is down 1060 feet with crosscutting in progress on the bottom. At the Modoc all work above the 1000-foot level is suspended for the present. Hoskin & Co. have secured a lease on the west end of this claim; they have machinery on the grounds to put down their shaft as fast as possible. At the Mountain Consolidated both shafts are down to the 1300-foot level; at the No. 2 shaft a streak of ore 15 feet wide was encountered in cutting the station. This is considered a stringer from the vein. At the Never Sweat the shaft is down below the 1400-foot level, with sinking still in progress. The ore on the 1200 and 1300-foot level is from 80 to 100 feet wide. At the St. Lawrence the shaft is down below the 1300-foot level.

Preparations are being made to sink a shaft 1000 feet on one of the syndicate group of mines belonging to the Anaconda Company. This mine is a silver property and but little work has been so far done on it, the shaft being now down about 5 feet.

COLORADO.

(Special Correspondence).—In Cripple Creek district operations have been resumed on the Wisconsin group of claims, between Bull hill and Battle mountain, by E. Hasey, who has outlined some extensive development work.

The litigation between the Smith-Moffat Syndicate, owners of the Granite lode, on Battle mountain, and the Portland Gold Mining Company, whose Portland group of mines adjoin the Granite, is in a fair way toward settlement. James Doyle, treasurer of the Portland Company, and several of the large shareholders have secured an option of sixty days on the Granite mine, and it is probable that the property will be purchased before the option expires. The litigation between the companies is due to both of them laying claim to the apex of the Bob Tail vein.

A new plant of heavy machinery is being erected on the Vindicator mine on Bull hill, one holding of the Vindicator Gold Mining Company. The new plant will consist of a four-drill compound air compressor, a 10x14 hoist, good for 1500 feet, two 100 H. P. boilers and a cage. The working force of fifty men will be increased to one hundred when the machinery is in place. The 300-foot station in the main shaft is completed and the drifts are being extended both east and west, opening up large bodies of stoping ground. The output for February was 700 tons of ore and the March output will reach from 1000 to 1200 tons.

The bond and lease on the Squaw mountain tunnel were this week purchased from R. M. Maloney, E. L. White and J. Cooper by D. Curry of London, representing a wealthy Scotch syndicate. The bond to the tunnel company from the owners was for $200,000 and the consideration for the transfer was a cash payment of $40,000. The lease originally granted was for two years and there are yet eighteen months of unexpired time. About two months ago the buildings and machinery at the mouth of the tunnel were destroyed by fire, since which time the bore has been driven by hand and has reached a distance of over 1600 feet into Squaw mountain from the southwest. Several rich veins have already been cut by the bore and different sets of sub-lessees have been making numerous shipments from them. The new owners have ordered a new plant of machinery, consisting of one six-drill compressor, four Eclipse-Ingersoll drills, and two 80 H. P. boilers.

The United States & British Columbia Mining Company have taken a one-year lease on the Los Angeles mine on Bull hill.

Colorado Springs capitalists have been granted an eighteen-months option on the Marguerite lode, in Poverty gulch, by the Marguerite Consolidated Mining Company. The price to be paid is $20,000 and the lessees agree to work forty shifts per month and pay 20 per cent royalty on ore extracted.

In order to cut the Lincoln vein a new 170-foot shaft will be sunk.

GILPIN COUNTY.

(Special Correspondence.)—The U. S. M. property, which parallels the gulch at Central City, is being developed under the management of W. H. Knowles. The present depth of the shaft is 250 feet, with workings at the 150-foot level.

The large producing mines in Russell gulch are the Saratoga, Frontenac and Aduddel. The Saratoga, belonging to the Saratoga and Cyclops Gold Mining Company, is sinking a cage shaft, which has reached a depth of 800 feet. Its March shipments amounted to 100 tons of ore.

The Frontenac produces a silver-lead ore, and shipments amount to 150 to 200 tons per month. This property is worked under a system of leases.

The Aduddel mine is on the same vein as that of the Frontenac. Shipments equal about 150 tons per month. It will be seen that these three principal mines of Russell gulch produce practically no free milling ore, which is a departure from the ordinary Gilpin county proposition.

The mines and mill of the Vendome company are keeping up a good record of production. Their ores are of two classes—one heavy in lead, and the other pyrites of iron, the gold in which is quite free, though the amalgamation is freer in the iron ores than in the lead. The Vendome has been a producer for fifteen years.

In Gilpin county, with ore from the recognized free-milling belt, a mining company, having its own milling facilities, can produce its ore, mill it, and reduce it to bullion at a cost of $2.50 per ton.

The Queen of the West, in Chase gulch, is under the management of C. M. Shaw. The old shaft has been retimbered and sunk to a depth of 370 feet. A new pumping plant has been put in, and new hoisting machinery is contemplated. The sinking has been on the vein, which is said to be 5 feet in width. The ore is mill dirt.

The Concrete, on Grinnell hill, is working with a force of fifty men, and outputting fifty tons of ore per day. Drifts are being run east and west at a depth of 1200 feet.

The Kansas-Burroughs mine, on Quartz hill, is shipping from fifty to sixty tons per day, and is developing with the view of making a larger output.

The stamp mills and concentrating plants of the district are operating at about full force, and as spring work opens they will have all they can do.

The Rocky Mountain concentrator is conceded to be filling a good office in the district. It puts rebellious ores into such form as make them desirable to the smelters, which make practically no treatment charge.

Pine creek district, lying about seven miles west of Central City, is making steady progress, and the town of Apex presents a busy appearance. This district is more than 1000 feet higher than Central City and the snows have been heavy there the past winter. Notwithstanding some disadvantages, there is much work in progress and a good many properties are being equipped with machinery. Among the tunnels being opened are the Annie H., Lessie B. Davis, Fourth of July, Booster, Nancy Hanks, Gilbert, Schultz-Wonder, Martin, Cora, Calhoun, St. Louis, Zang, Sechrist and Bob Davis. Among the shafts equipped with machinery and being sunk are the Plateau, Mascotte, Manchester, Anter, Nancy Lee, Stamboul and Moose.

The W. J. Chamberlain sampling works at Blackhawk, which were destroyed by fire a few weeks ago, are being rebuilt on a much larger csale.

CLEAR CREEK COUNTY.

At Idaho Springs the Mixsell mill is being enlarged from fifteen to thirty stamps.

Andrew Anderson has just completed a new milling plant. Its capacity will be about twenty-five tons in twenty-four hours.

WASCOTT.

NEW MEXICO.

At the Red River mining district, fifteen miles northwest of Elizabethtown, the veins are reported numerous and wide. The ore is a hematite, some being oxidized and free milling, but not enough work has yet been done to thoroughly demonstrate whether the milling ore will last to any great depth, most of the holes being only from 15 to 25 feet deep. About 800 men are at work on producing mines and prospects for wages. No work of any importance can be done there much before the middle of April, as there are 2 feet of snow on the ground now, and several prospects which are in ore are unable to work on account of the snow. The extent of the district has not yet been developed, but probably the mineral belt extends not less than thirty miles in a northwesterly direction. The line of the Maxwell land grant is about four miles south of Red River City, and some good finds have been made within the grant. The grant owners have given prospectors the same privileges that are accorded by the United States laws for one claim, but retain all extensions of any vein discovered.

Las Vegas *Optic*: At Hopewell the Cinnabar Mining Company have their new shaft down 150 feet. They will commence drifting at once to cut the main lead.

On the Little Mary mine, owned by the Eureka Mining Company, in drifting from their main shaft, they have cut a 7-foot lode and have drifted 100 feet on it and are taking out ore.

On the Good Hope property, owned and worked by Burlington railway officials, they have their tunnel in 300 feet and are pushing ahead to cut the main lode.

The Gold Nugget claim in Jones gulch, shows four distinct lodes, running in width from 2 to 8 feet.

Silver City *Enterprise*: W. H. Newcomb has started shipping iron ore from Legal Tender hill, just outside the city limits. He is shipping two cars per day.

A new strike of importance is reported from the west side of Pinos Altos mountains; or it might be called a rediscovery of a long lost mine. Judge J. W. Ball discovered it in 1867 but no one knowing much about silver it was abandoned. After some ten years he made fruitless efforts to discover it. The vein is 4 to 5 feet between the walls.

At the Mogollon the main shaft on the Confidence mine has attained a depth of 452 feet. Work on sinking has been suspended until better hoisting facilities are provided.

There are eight men employed on development work upon Maud S.

ARIZONA.

Republican: The new mill of the Buckhorn Mining Company in Buckhorn Basin is now complete.

Manager McLane of the Senator Mining Company in the Buena Vista district says that they have several shafts sunk varying from 50 to 200 feet and all of them have encountered rich ore. A large stamp mill will be put in soon.

The Black Warrior Copper Company is formulating plans for reduction works and other improvements of their properties.

The Baxter mines in Pima county have made a shipment of copper ore averaging 27 per cent.

On April 1st work was begun on the Lacey-Falson copper properties in the Silver Belt district, by H. Sissons.

Supt. W. Jackson of the Pinto Creek Mining and Smelting Company reports that at 100 feet the tunnel on the Yo Tambien has struck very rich sulphuret ore, the breast of ore being 5 feet in width.

Prospectors are scouring the district in the vicinity of the King of Arizona and valuable finds and locations are reported.

In the Sierra Pintado region in the northwestern part of the district of Altar, close to the Arizona line, some very rich gold discoveries have been recently made.

N. Galles is putting in a cyanide plant on the Santa Maria property owned by the Swiss Belle Company.

Dr. Plank is about to build a mill on Silver creek in the San Francisco mining district.

The Co-Operative Mining and Milling Company on the Auga Fria has completed its pipe line and the mill has been started up. The pipe line is 8,000 feet in length with a 201-foot head, the pipe being from 12 to 15 inches in diameter which gives them 100 H. P. Electricity is generated from a large dynamo by this water power. The mill has ten stamps and the company has ore enough in sight now to keep it in operation for four months. Their deepest shaft is as yet only 120 feet deep but they have a body of ore in it 20 feet wide, the vein running from 3 to 20 inches in width.

ALABAMA.

E. A. Smith, State Geologist and secretary Alabama Ind. and Sci. Society, Anniston, Alabama, reports that the mineral industry of Alabama during the month of February, 1897, resulted in the following productions:

	Tons.
Coal	402,726
Coke	96,343
Iron Ore	214,135
Pig Iron	59,201
Limestone (for Flux)	19,140

SOUTH AFRICA.

The following from the report of the Van Ryn is a good example of the close working of some big mines on the Rand with small profits:

Milling—Owing to the scarcity of labor the available hands were employed in the widest stopes, where the rock is broken with the least labor. The yield per ton in the mill has on account of this been only 5.4 dwts. The run of the mill has been a good one, considering that it stopped over Christmas Day for 24 hours. Since the receipt of these particulars from the manager the labor supply has increased, and we are advised that during January a profit of £228 was made. For February a higher percentage of the ore is now being sorted, and the results are expected to show considerable improvement. December: 80 stamps ran 29 days 14 hours, ore crushed 10,141 tons, crushed per stamp per day 4.3 tons, amalgam won 8956 ounces, bullion gold 2750 ounces, yield per ton in bullion gold 5.4 dwts. Cyanide works: The extraction of the cyanide works has been better than November, being 74 per cent. December: Tonnage treated 6400, yield in bullion gold 837.37 ounces, yield per ton 2.659 dwts, theoretical extraction 73.7 per cent. Ore at surface, December, 3613 tons. Native labor: All work on the property has been impeded by the scarcity of native labor. At present it is difficult to engage boys except through agents, and almost as difficult to keep them. The Pass Law does not prevent the boys from clearing. It causes great expense and inconvenience without giving protection.

Scientific Progress.

Ascending the Highest Peak of the Andes.

The highest mountain of the American Andes, Aconcagua, 24,000 feet high, has been ascended. On Jan. 14th Zurbriggen, the Swiss guide of the Fitzgerald expedition, stood on the summit—an elevation of more than 24,000 feet above sea level. He has thus anticipated the feat upon which Mr. Fitzgerald had set his heart, and for the accomplishment of which he organized the expedition. The difficulties of the ascent were numerous. The cold was intense, and apparently interminable slopes of snow stretched upward and mocked the hopes of the weary climbers. But this was not all. "Mountain sickness," due to the thinness of the air, also tested their physical powers and endurance. It must be a great mortification to Mr. Fitzgerald that the superior physical powers of his guide carried him to the summit before his courageous leader, but illness for a time forbade further struggle on the part of the latter.

Mr. Fitzgerald and his party set out for the ascent of the mountain on Dec. 23rd, expecting to reach the summit four days later. On the 25th the party bivouacked at an elevation of 19,000 feet, on the neck of the mountain, in a gale of wind and snow. All suffered from sickness and the intense cold. Next day two porters had to be sent back ill. Zurbriggen, whilst prospecting around, found Gussfeldt's card in a tin box, dated March, 1883. This was at a height of 21,000 feet. The Russian furnace, upon which so much of the comfort of the party depended, would not act, and exploded. Thenceforth, there was no hot food, which was a serious deprivation, and this want forced the party to descend to the valley on the 27th. There they remained three days to recruit, meanwhile sending up wood and water to the neck of the mountain in readiness for another attack. On the 30th they braced themselves for a second attempt. The boiling thermometers were useless, for they were not rated high enough. During three days the lowest temperature was 5° Fahrenheit; the highest, in the sun, 26.46°. On the 31st they were struggling painfully upward, and Zurbriggen's feet became frosted. They had to halt for two hours in consequence. After constant rubbing, they succeeded in restoring circulation. Struggling upward, a height of 22,500 feet was reached, and then exhausted nature gave in. They returned on Jan. 2d to the starting point to recruit. On the 9th they made a third attack on the mountain, the cold then being intense. On the 14th a height of 23,000 feet was gained, and there, unfortunately, Mr. Fitzgerald had to turn back ill, when only about 1000 feet from the summit. It was very mortifying. Zurbriggen continued the ascent and stood on the apex at 5 o'clock.

Zurbriggen's feat crowns all similar achievements. Humboldt, in 1802, climbed Chimborazo (19,000 feet), and in 1890 was followed by Mr. Whymper, whose record as a climber is familiar to all. Among the Himalayas, in 1892, Sir Martin Conway climbed Pioneer Peak, estimated at 22,000 feet, and Mr. Mummery and Mr. Hastings reached 21,000 feet on Nanga-Parbat. Only a very sanguine climber can indulge in the hope of scaling Mount Everest (29,000 feet) and Dapsang (28,700 feet) which tower above the giants of the Himalayas.

In a recently patented process a thin film of gutta percha is applied to a sheet of paper or fabric, and when the surface thus covered is laid on another surface and submitted to heat and pressure a union is effected by the melting of the gutta percha, which when cool again joins the two surfaces strongly and effectually. It can be used advantageously in bookbinding, backing and mounting paper, making card and mill board, pasteboard, etc., and mounting photographic and other prints. Sensitized photograph papers thus coated on their posterior sides may be used like ordinary sensitized papers, the gutta percha having no effect on the chemical baths. These products preserve their adhesive properties indefinitely under the influence of high temperature and may be used at any period after their manufacture.

Electrical Progress.

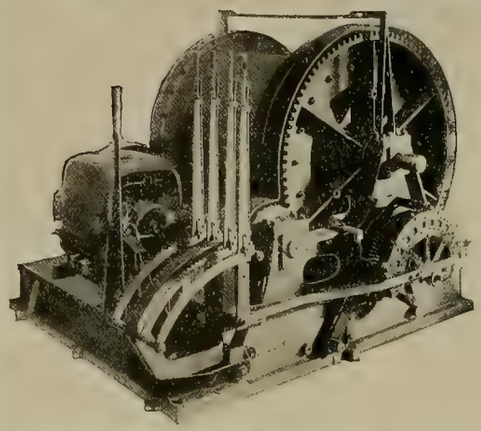
Electrical Mining Hoists.

At the Free Silver mine, at Aspen, Colorado, is an electrical hoist, rated at 125 H. P., but capable of applying to the hoisting machinery power to the extent of 200 H. P. This is the largest electrical hoist in the world. It is a double-reel flat-rope overbalanced hoist, built after the designs of Mr. D. W. Brunton, manager of the Free Silver Mining Co., and also of the Cowenhoven tunnel, Della S., Alta Argent and Johnson mines.

The electrical equipment consists of one General Electric Company's 100-kilowatt multipolar motor, with a speed of 550 revolutions per minute, and a smaller motor of similar type of 60 K. W. capacity and a speed of 475 revolutions. This smaller motor is ordinarily used to run an air compressor and winch for pulling ropes, but in case the main hoist motor is called upon for heavier work than usual the smaller one can be thrown in gear with it.

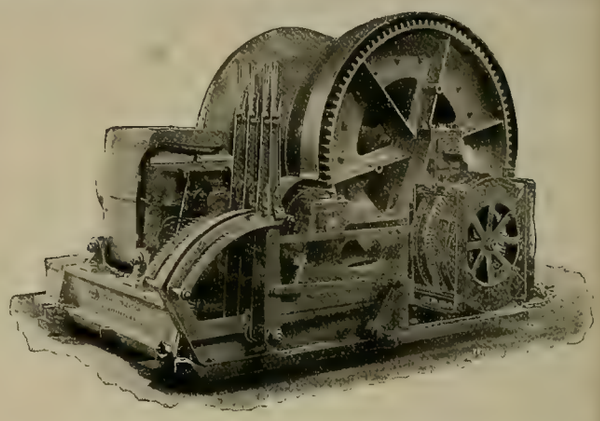
The hoist being counterbalanced the load on the motors is reduced to about one-third of that which would be thrown on a plain hoist of the same capacity. The radius of the arms of the reels is 5 feet, each reel carrying 1500 feet of rope 4 in. wide and ⅝-in. thick. The hoist is provided with a car and cage, and the loaded car and cage weigh about 5000 lbs. As in sinking the mine it cannot be timbered entirely to the bottom, and the cage cannot go below the timbering, a bucket is hung below the cage. This is 35 in. high and about 28 in. in diameter. It weighs 400 lbs., and holds 12¾ cu. ft. of water weighing 800 lbs. or rock weighing 2000 lbs. To relieve the shaft from a sudden inflow of water, this hoist is provided with a bailer, which is used as an adjunct to the pumps. This is 4 ft. 2 in. by 3 ft. 2 in. by 8 ft. 4 in. and weighs empty 1950 lbs. and filled 8880 lbs. The counterweight used with the cage and bucket is 2450 lbs.; with the cage and car 2675 lbs. With the bailer these two weights are used, making a total counterweight of 5125 lbs. The maximum hoisting speed with the cage and car, and using the small piston on the motor, is about 600 feet per minute; with the bailer, and using the larger pinion, about 1000 feet per minute. The voltage used is 525 volts, and the current is taken from the central station at Aspen.

Last summer an interesting test was made with this hoist when using it for bailing. At that time the mine shaft was 835 feet deep, a depth to be ultimately increased to from 1200 to 1500 feet. The condensed figures showing the operation of this hoist during the test are as follows:



HOISTING.

Weight of bailer, 1950 lbs.; water, 6930 lbs. Total	8880 lbs.
Counterweight	5125 lbs.
(Ropes balance, considering entire trip.)	
Net weight raised	3755 lbs.
Depth of shaft	835 ft.
Work, 3755 x 835	3,135,425 ft. lbs.
Time hoisting	2.25 min.
Foot-pounds per minute	1,393,521 ft. lbs.
Mechanical H. P., 1,393,521 ÷ 33,000 =	42.2 H. P.



LOWERING.

Counterweight	3175 lbs.
Weight of bailer empty	1950 lbs.
(Ropes balance, considering entire trip.)	
Net weight	3175 lbs.
Depth of shaft	835 ft.
Work, 3175 x 835	2,651,125 ft. lbs.
Time of lowering	2.25 min.
Foot-pounds per minute	1,178,277 ft. lbs.
Mechanical H. P., 1,178,277 ÷ 33,000 =	35.7 H. P.

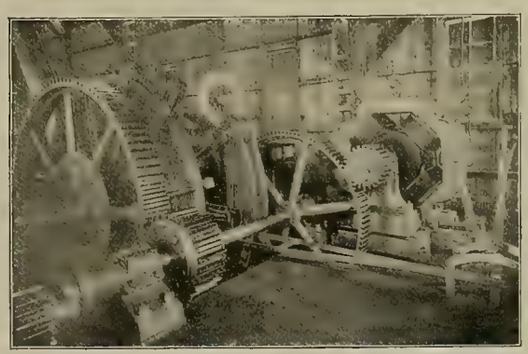
ELECTRIC HOIST, PLEASANT VALLEY COAL CO., CASTLE GATE, UTAH.



ELECTRIC HOIST, PLEASANT VALLEY COAL CO., CASTLE GATE, UTAH.

ELECTRIC HOIST, ALTA ARGENT MINE, ASPEN, COLO.

HEAD OF INCLINE, ALTA ARGENT MINE; HOIST CONTROLLED FROM THIS POINT.

OVER-BALANCED ELECTRIC HOIST, FREE SILVER MINE, ASPEN, COLO.

ELECTRIC HOIST IN MALTBY COLLIERY, LEHIGH VALLEY COAL CO., WILKESBARRE, PA.

Aspen, Colorado, is another hoist. This is placed at the head of the incline. The current is taken from the power plant of the Roaring Fork Electric Light and Power Co., three and one-half miles distant, two miles being above the ground and one and one-half miles through the Cowenhoven tunnel and mine workings. This hoist is also overbalanced and is equipped with a General Electric Company's multipolar slow-speed 500-volt motor, having a capacity of 20 H. P.

The location of this hoist has been arranged with an eye almost exclusively directed to the convenience of handling the cars. The hoist is placed on a platform about 10 feet above the level at the head of the incline, where the ore cars are stopped and run off after being hoisted. Here the hoist operator stands and handles his controlling levers and reversing switch. This arrangement gets the hoist out of the way, while it allows the operator to attend to the cars. In the case of other hoists at Aspen, the hoist is placed directly at the head of the incline. This relegates the operator to the back of the hoist, where he can see both shaft and rope when hoisting and lowering. To attend to the cars he would be compelled to pass around the hoist, and as this entails a loss of time, a second man to handle the cars is usually necessary. At the Alta Argent one man suffices to operate the hoist and handle the cars.

In the mines of the Pleasant Valley Coal Company of Castle Gate, Utah, is another direct current mine hoist, used for hauling the coal cars up the incline. This hoist is a double-reduction single-drum hoist, equipped with a standard L. W. P. 20 H. P. railway motor and double 51 rheostat. It is designed to lift 4000 lbs. 500 ft. per minute. The drum is 47 in. in diameter and 36 in. face, with two brake bands in V-shaped grooves on the drum. It is provided with both friction and positive clutches and is operated by five levers—one for the rheostat, one for the friction clutches, one for the positive clutch and two for the brake. The dimensions of the base, on which are mounted the drum, motor and controller, are only 78 in. by 95 in. Another hoist of similar pattern, but using a friction clutch only and a G. E. 2000 motor with a double 83 rheostat, has recently been added to the very complete mining equipment of the Pleasant Valley Coal Company. The motor in this case is fully enclosed.

The three hoists just mentioned are in the West. In the mines of the Lehigh Valley Coal Company, at Maltby, is the direct current electric hoist shown in the illustration, very similar to that at the Castle Gate colliery. The dimensions of the drum are the same, the G. E. motor is of similar capacity, but the controller is of the N. R. type with packed ribbon rheostats mounted separately from the base. It is designed to hoist 5000 lbs. at a speed of 500 feet per minute.

All these hoists are and have been in constant service for months without serious hitch or stoppage beyond those necessitated in ordinary mine service.

Practical Information.

Packing Goods for Mexico.

The following paragraph is from the annual report of Consul Oliver of Merida, dated January 19, 1898:

"This section of the Mexican coast, from Progreso to Vera Cruz, being absolutely devoid of safe harbors, compels me to again remind exporters to pack their goods more securely, so that they may stand the rough handling to which they are invariably subjected in their transfer from the ships to the lighters, by reason of the rough, open sea and the "northers" which visit this coast during five months of each year. The merchants here are unanimous in their complaints regarding the careless manner in which all merchandise from the United States is packed. They further state that, by reason of this carelessness, they have lost a large amount of trade, which has gone to Europe, where all merchandise is skillfully and securely packed, with an eye single to the conditions referred to."

JAMES MEIKELJOHN of Rhinelander, Wis., has invented a novel form of crosscut saw, which is an endless chain affair. It is adapted to the cutting of large timber, and, it is claimed, will go through a good-sized stick in thirty seconds. It will cut down trees of any size up to 10 feet in diameter, and cut the tree into desired lengths. The saw teeth travel round a steel frame, 3½ feet long and 6 inches high, rounded at the ends, and about as thick through as an ordinary rotary. Power is transmitted by a sprocket wheel at the shaft end of the blade. The saw can be raised and lowered at will. In use it is simply rested on the log, and quickly does its work. Compressed air, electricity or steam can be used to operate the saw. By using an extended shaft it can be used to cut off piles under water.

AN unusual incident recently occurred in the timber near Fossil, Or. Beaber and French sawed through a tree measuring 13 feet in circumference, and though they sawed until the teeth of the saw came through on the opposite side; though the tree top was free from all support; though they pried and chopped and wondered and talked, still that tree stood there, and still the saw remained pinched in so tightly that it could not be moved. At last they were obliged to go home, leaving the tree standing on its stump. Next day the tree was down. It had apparently sprung or slid from the stump, striking perpendicularly in the sandy soil at first, making a hole 5 feet deep and as far across.

Cheap
Power!

SAVE MONEY BY USING
—THE—
"DANIEL BEST"
Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav.,	7½ galls.	at	5c.,	$.37½
Distillate.....40	7½	"	8c.,	.60
Domestic Coal Oil....40	7½	"	12½c.,	.93¾
Gasoline.....74	8¾	"	15c.,	1.31¼
City Gas.....1000 feet,				2.00

We manufacture all sizes from two-horse power up, and will guaranteee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Coast Industrial Notes.

—The Salinas, Cal., beet sugar factory will cost $2,000,000.

—Upwards of 900 carloads of beans from last year's crop remain over at Ventura, Cal.

—The San Timateo, Cal., oil "boom" is done, and the last derrick has been shipped back to Los Angeles.

—Over ten miles of the new Sierra Railroad from Oakdale to Sonora, Cal., is graded, and a mile of track laid.

—The Oregon Short Line has sent in engineers to see if it is feasible to build a road from the south into the Seven Devils copper district in Idaho.

—An attempt is being made to make telephone connections between San Francisco and Yreka. The lines running from Yreka to the west in the mining districts of the Klamath and those connecting Sisson with Redding will probably be joined.

—The Risdon Iron Works is pushing work on the iron structure of the new Union ferry depot at the foot of Market street, San Francisco. President Colnon, of the Board of Harbor Commissioners, thinks that the building will be completed within a year.

—The salmon fishing season on the lower Columbia opens to-day. The usual "strike" is on, the canners offering 4 cents per pound, the fishermen demanding 4½. About the 1st of May one or two of the canners will accede and then the season's work will fairly begin.

—The Redlands, Cal., Light and Power Company proposes to issue $50,000 in stock, half to be bought by citizens and the other half to be retained by the company, for the purpose of substituting electricity for mule power upon the street railways in that town.

—Riverside, Cal., claims that the running expenses of the city electric plant are $1150 per month, and there is a revenue of $670 a month, leaving $480 as the cost of running eighty-four arc lamps. This, however, does not take into account interest on cost or depreciation of plant.

—The Power Development Company has built a flume along the wall of the canyon to the location of the power house, fifteen miles from Bakersfield, Cal., with a capacity of plant of 10,000 volts. The cost of the work has been nearly $175,000 and the power is expected to be sufficient to run all the local machinery.

—On Thursday, the 8th, C. P. Huntington was re-elected president of the Southern Pacific Company. The report shows that the gross earnings for the twelve months ending Dec. 31st last were $48,656,419, as against $50,457,022 for the year 1895. The expenses were $31,961,916, as compared with $33,242,398 for 1895.

—C. P. Huntington of the Pacific Mail says he intends to add a new steamer to the China run to replace the City of Rio Janeiro and Peru, which are considered too slow. He intends to build a 10,000-ton vessel, to cost about $1,500,000. He says the construction of the vessel will soon be begun at Newport News, where he owns a large shipbuilding plant.

—The committee to raise subscriptions for the proposed railroad from San Diego to the back country has obtained signatures for over $10,000. The total cost of the road is estimated at $200,000, and $20,000 must be subscribed. Besides these subscriptions of stock, a subsidy of 700 acres of land in Santa Maria valley has been given, and many farmers have agreed to do work at grading, taking one-half cash and the other half in stock.

—The success of the Joggen's log rafts from the Columbia river in '95 and '96 has occasioned the formation of a combine of San Francisco lumber mill men, who have bought out Baines & Robertson, and propose bringing down two large rafts this season—one in June and one in August—from the Columbia river, each containing about 7000 M feet, board measure. They figure a large saving in freights and the utilization of considerable refuse.

—The Atlantic & Pacific Railroad will be sold at auction on May 3, at Gallup, N. M., to the highest bidder. No bid of less than $5,000,000 will be entertained by the auctioneer. It will be purchased, no doubt, by the Santa Fe people. The Atlantic & Pacific runs from Albuquerque to The Needles. From the latter place to Mojave Junction the Santa Fe has been operating the Mojave division of the Southern Pacific, which it will purchase next month. Large sums of money will certainly be spent in improvements on this through line. The roadbed will be braced up and a new line of telegraph constructed from Barstow to Los Angeles, which, while not a part of the Atlantic & Pacific, is its near relation.

—F. R. Lingham, head of a large lumber firm in Johannesburg, South Africa, is in Seattle, Wash., to place an order for 20,000,000 feet of lumber. Within the past eighteen months Lingham has shipped nearly 30,000,000 feet of lumber from Puget sound to South Africa. The vessels will carry, also, cargoes of heavy merchandise from San Francisco, where an order for 4000 tons of mining machinery was lately placed. Four hundred tons of this machinery is to be taken back by each ship, in addition to the regular lumber cargo. By the end of next year most of the wheat and flour consumed in the Transvaal and other South African States will be purchased and shipped direct from the Pacific coast.

Recently Declared Mining Dividends.

Morning Star Gravel Mining Co., Colfax, Cal., $5 per share; payable April 1.

Alice Gold and Silver Mining Co., Montana, $20,000; payable April 7.

Silver King, Utah, $37,500; payable April 10.

Personal.

CAPTAIN HENRY GLASS, U. S. N., has been detailed as captain of the yard at Mare Island.

EX-GOVERNOR BENJAMIN BUTTERWORTH of Ohio has been appointed Commissioner of Patents.

CAPTAIN THOMAS COUCH has returned to Montana from California, and is at his ranch at Great Falls.

D. J. BAUME of Butte, Montana, has been appointed superintendent of the Bald Eagle mines at Boundary, Wash.

A. MALTMAN of Grass Valley, Cal., goes to northern China to superintend the mining operations of an English company.

W. E. SHARON has been appointed superintendent of the American Flat Development Company at Virginia City, Nevada.

VICTOR CLEMENT, who has been examining the Mercur mine at Mercur, Utah, and the De Lamar in Nevada, has left for London.

W. C. QUINBY, representing the MINING AND SCIENTIFIC PRESS, leaves on the 29th inst. on an extended sojourn in Australia.

B. A. CARDWELL of Salt Lake is at Truckee, Cal., considering the feasibility of reduction works there to handle the Meadow Lake ores.

F. M. SOUTH was elected secretary, and L. L. Jewell treasurer of the Southern Oregon Miners' Association, at Grant's Pass, last week.

LIEUTENANT-COLONEL S. B. M. YOUNG of the Fourth Cavalry, U. S. A., has been detailed as superintendent of the Yellowstone National Park.

JAMES F. WARDNER of Wardner, Idaho, Rossland, B. C., etc., proposes to write a book of reminiscences of the bright side of mining life in the western part of the United States and British Columbia, with a chapter or two in Africa.

Commercial Paragraphs.

THE Colorado Iron Works has shipped one of their new single elliptical slag trucks to Leadville for the use of the Arkansas Valley Smelter.

STEELE, BRISTOL & Co., having purchased the right for Colorado to operate with the Beam Converting Gold and Silver Process, have erected a plant in Denver, Colo., to treat ore by that method.

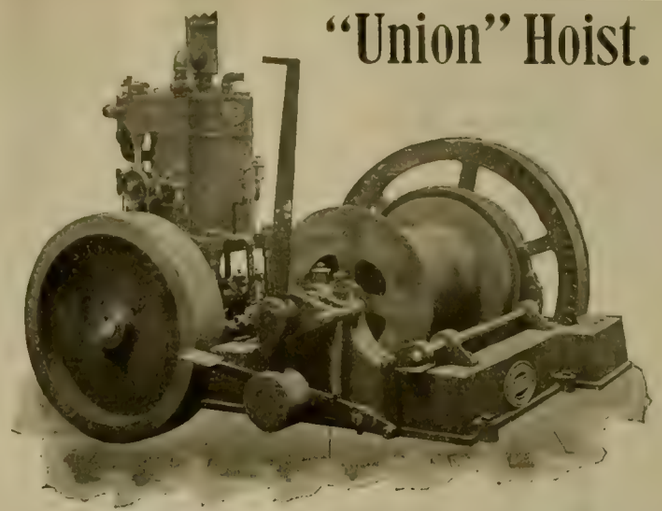
THE Mine and Smelter Supply Company of Denver, Colo., are introducing the Wilfley concentrating tables in some of the old established stamp mills in Gilpin county, Colo., having lately put one in the Blackhaw mill at Blackhawk, Colo.

THE Montgomery Machinery Company of Denver, Colo., recently shipped an 80 H. P. boiler to Albuquerque, N. M., for the electric light works at that place; also, a hoister, crusher, boiler, ore feeders and concentrators, to White Oaks, N. M., for a mill in that district.

THE Risdon Iron Works, Howard and Beale, San Francisco, have issued the tenth edition of their catalogue, No. 8, "The Bryan Roller Quartz Mill," and "The Johnston Concentrator." In these the effort has been to still further advance the standard of efficiency. In the construction of the mill there has been an improvement in the manner of app'ying the motive power. Illustrated details of the mill and concentrator are fully set forth in the catalogue, which will be sent to any address.

BYRON JACKSON of San Francisco has a contract to furnish pumps and machinery for the Rockford, Illinois, water works. This California contract for an Illinois corporation was secured solely on merit, and suggests a good many things worth thinking about. There are three pumps with a daily capacity of 9,000,000 gallons, each driven by a cross compound single valve 100 H. P. condensing engine. The machinery in its entirety weighs thirty-six tons. The plant is to be in working operation June 1, '97.

Book Notices.



McNeill's Code: By Bedford McNeill, F.G.S. All telegraphic codes have the same purposes—to save costs in telegraphing, to ensure secrecy in confidential correspondence and to avoid liability of error. The author, a mining engineer, has made up the 4400 phrases given in the code with especial reference to the needs of mining men, engineers, directors of companies, bankers, brokers, accountants, financiers and merchants, all of whom will find this code economical and in other respects serviceable for their purpose. One of its special features is a schedule embracing the phrases required when surveying or reporting upon mineral property. Another is the system for transmitting full and detailed monthly reports from mines, smelters, etc., at very low cost, intelligently and safely. Besides answering these special purposes, this code meets all the requirements of general commercial correspondence. Published by the Scientific Publishing Co. and for sale by Henry L. Tyler, 207 Montgomery St., S. F. Price, $7.50.

Recent California Mining Incorporations.

Angus M. & M. Co., Los Angeles; capital stock, $500,000—all subscribed; F. H. Rust, I. N. Inskeep, J. J. Lonergan, B. M. Calkins, E. R. Shrader.

Uyak Mining Company, San Francisco; E. B. Pond, W. B. Bradford, C. Hirsch, R. Minor, H. T. Fortmann. Capital stock, $500,000.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

London Head Office.....**8 Drapers Gardens.**
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

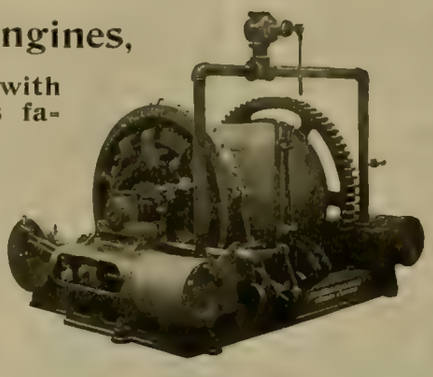
PATENT SOLICITORS.
ESTABLISHED 1863
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents. 220 Market St., S.F.**



FRASER & CHALMERS,

Chicago, Illinois,

Have brought out a new line of medium size

Steam Hoisting Engines,

These are designed with great care by engineers familiar with the best previous practice, and knowing just what is wanted to render satisfactory service on a mine. Do you want such service? Then buy one of these improved machines.

Other Special Lines of Manufacture

On which we would be glad to quote are

Stamp Mills, Shoes,
Smelting Furnaces, Dies,
Cyanide Plant, Cams,
Ore Crushers, Rolls,
Frue Vanner Concentrators, Jigs,
Brown Roasting Furnaces,
Huntington Mills,
Perforated Metals and Screens,
Corliss Engines,
Adams Boilers,
Riedler Air Compressors & Pumps,
Otto Aerial Tramways.

Qualified by a Quarter Century of Experience to render you the best of service, we invite your inquiries and patronage.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado, send to

579,729.—SPARK ARRESTER—H. H. Warner, Tacoma, Wash.
579,921.—IGNITER—G. L. Woodworth, Palo Alto, Cal.
579,813.—TRANSFER BRIDGE—A. McK. Wylie, Stockton, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INSULATORS AND HOLDERS FOR ELECTRIC RAILWAYS.—Willie C. Keithly, S. F. No. 579,725. Dated March 30, 1897. This invention relates to a device for holding the insulators by which the trolley wires of electric railways are suspended. It has for its object a novel means for securing the insulator within a protecting cap or cover, and removably locking it thereto, and means for suspending the whole device from the posts which are designed to support the wires along their course. It consists essentially of a cap substantially of the form of a frustum of a cone having interior oppositely placed projecting lugs, a correspondingly shaped insulator having oppositely placed lugs upon the exterior adapted to engage and lock with those in the interior of the cap when the insulator is turned therein, lugs in the interior of the insulator, a shank or stem adapted to connect with and suspend the trolley wire, said shank having a winged disk adapted to lock with the lugs in the interior of the insulator, a protecting disk secured thereto below the mouth of the insulator. In conjunction therewith are hooks so disposed upon the top of the cap as to receive the transverse supporting wire and a groove or channel in the top of the cap in which this wire lies between the hooks.

HOISTING APPARATUS.—Wm. F. Murray, S. F. No. 579,719. Dated March 30, 1897. This invention relates to a hoisting apparatus such as is employed in conjunction with pile drivers for raising a weight and releasing it. It consists essentially in the combination of a winding drum, a driving gear with which it is forced into engagement, a shaft upon which the gear is fixed and the drum is slidable, means for resisting the thrust of the engagement of the drum with the gear so that the collar is prevented from rotating on the shaft. This means consists of concealed pins seated in tongues projecting inwardly and adapted to enter sockets in the shaft.

PONTOON TRANSFER BRIDGE FOR DIKES OR CANALS.—Alexander McKay Wylie, Stockton, Cal. No. 579,813. Dated March 30, 1897. This invention relates to the general class of apparatus used in making or dredging water courses, canals, ditches and other excavations and forming in connection therewith dikes and embankments bordering on the work. It consists essentially of a pontoon or float, a bridge connected therewith extending to and over the bank and having a support upon the bank upon which the projecting portion is supported, a car adapted to receive the material to be transferred from the dredger, means for effecting the travel of the car from the pontoon or float over the bridge and back again, means for automatically backing the car at the inner end of the bridge and pneumatic cushion cylinders with pistons so arranged and connected as to control the descent of the car over the curved portion where it delivers its contents. The car is provided with a swinging gate closing by gravity and latches which are disengaged to allow the gate to open at the proper time.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1896.

BRADLEY PULVERIZER CO. *Gentlemen*:—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker, and they average about 20 tons to each machine, 40 mesh fine, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills.** We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisble Lucop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DELAMAR.

HOW 10 GRIFFIN MILLS WORK.

DELAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

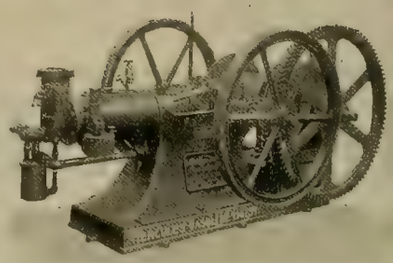
BRADLEY PULVERIZER CO. *Gentlemen*:—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager*.

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.



HERCULES GAS, GASOLINE AND DISTILLATE ENGINES

HOISTING ENGINES, 2 h. p. to 200 h. p. ✦ STATIONARY ENGINES, 1 h. p. to 200 h. p. ✦ MARINE ENGINES, 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ½ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.

NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim **full power, automatic and positive adjustment regulating speed and consumption of fuel** in proportion to work being performed. **No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.**

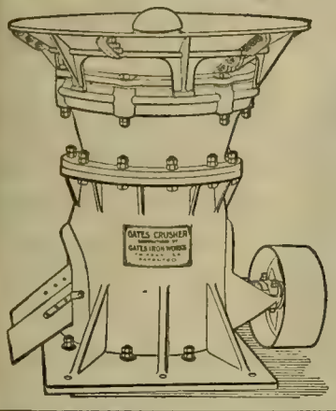
We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.



Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

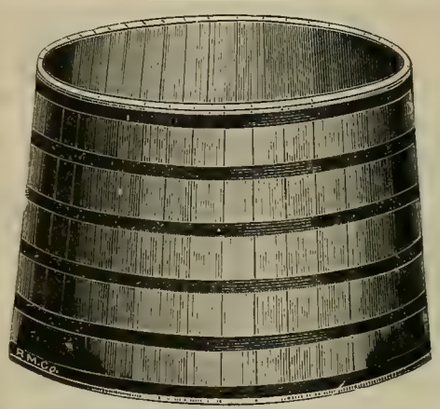
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.



Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

STATE ORE SAMPLING COMPANY, Denver, Colo.

Market Reports.

The Markets.

SAN FRANCISCO, April 8, 1897.

Jobbers report a steadily enlarging demand for all lines of goods with prices, as a rule, stiffening. Tariff legislation continues a disturbing factor, and until the bill has been further advanced in the Senate, dealers will be slow in banking on the high rates of duty the House bill calls for. When buying beyond nearby wants they do not take goods that have been advanced to about full figures with the proposed tariff added. This course is dictated by authentic information that the Senate will prune the bill very materially, and also that it will not accept the retroactive part. It is thought that the latter was adopted by the House so as to keep importers from shipping very large quantities of goods into this country. Crop advices continue of the most favorable character, but the season is backward, which endangers grain in sections subject to north winds. With the fruit and grain crops assured, business with the agricultural sections will be pushed by jobbers. Foundrymen and manufacturers report continued free inquiry for bids on new work. Many of them have considerable work on hand.

The local money market is practically unchanged. The banks report a liberal supply of funds on hand, with a light demand ruling. Idle money continues to come out for investment, but it meets with a slow demand. The belief prevails that within the next sixty days this demand will begin to increase for crop purposes. It is believed, also, that when tariff legislation is further advanced there will set in more activity in speculative channels, which will call for money. Merchants report fair to good remittances for the season of the year. New York advices are to the effect that money is still in large oversupply, causing low rates of discount to rule, notwithstanding an improved call from importers, woolen manufacturers and wool speculators. The supply of sterling bills on which loans have been made has been reduced to about $10,000,000. Money in England continues in oversupply. In the open London market the rate is as low as 1¼ per cent a year for call on gilt-edge security. Russia and Japan continue to buy gold, which keeps the premium strong.

New York Silver Prices.

NEW YORK, April 8. — Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	28 7-16	62
Saturday	28⅜	61⅞
Monday	28⅜	61¾
Tuesday	28 5-16	61 11-16
Wednesday	28⅜	61¾
Thursday	28 7-16	62

	Copper.	Lead.	Iron.	Tin.
Friday	10 70@10 75	3 37½	10 00@12 50	13 17½
Saturday	11 70@11 75	3 40	10 00@12 50	13 17½
Monday	11 70@11 75	3 40	10 00@12 50	13 20
Tuesday	11 65@11 75	3 40	10 00@12 50	13 20
Wednesday	11 65@11 75	3 40	10 00@12 50	13 30
Thursday	11 70@11 75	3 40	10 00@12 50	13 35

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.84¼
London Merchants	$4.85
London Sight Bankers	$4.88¾
Refined Silver, per oz., 1000 fine	62¼
Mexican Dollars	49@50

SILVER.—The market went off about ⅜ cent from last week's closing, but to-day it seems to be steadier. New York advices state that at the lower prices there has been very heavy shipments from that city to Europe. The fear still exists that Japan may yet authorize the sale of her bullion, and until this assumes a stronger negative form the market is expected to rule at low prices. Our New York advices report: "In India the stringency in the money market continues. Indeed, the expenditure upon famine relief is so great, and is likely to continue so long, that more or less of stringency may be expected for some months. At the same time the India Council is not selling very freely. The belief is that the drain upon the Government treasuries consequent upon the relief works is so great that the Council is not in a position to sell very freely."

MEXICAN DOLLARS.—The market is quiet at the low quoted prices. The uncertainty as to the course of silver causes Chinese shippers to confine their buying to actual wants.

QUICKSILVER.—Our market is reported the same as last week. The East reports a firmer market at New York, and also London. There has been a steady cleaning up of outside holdings, with a good consumptive call ruling.

Our market is quoted at $40 for domestic consumption.

COPPER.—Prices have continued to shade off in this country and also in Europe. There seems to be an entire absence of any speculative movement, which precludes the possibility of an upmove when the production is steadily increasing. The consumption in America and Europe is fully as large as it was at any time in 1896. In our market 14½ cents is an outside figure for ingots in jobbing lots.

The local market is quoted as follows:

Ingot, jobbing	—@14½
Ingot, wholesale	—@13½
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17

TIN.—The market at the East, after selling lower, has strengthened, closing strong today. The demand at the East and on this coast for tin plate is quite active, but, owing to selling competition, American plate is hard to quote correctly.

We quote as follows in a jobbing way:

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	$4 05@ 4 15
" " " light, "	3 95@ —

BORAX.—The outward movement by rail and water to the East is large.

The market is quoted as follows:

Refined, in car lots	4¾
Refined, in sacks	5
Powdered, in car lots	5
Concentrated, "	4½

POWDER—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11½c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

LEAD.—There is nothing new to report in our market. Prices shaded off at the East, but toward the close it recovered under an improved demand.

Our market is quoted in jobbing lots as follows:

Pig	4 00 @ 4 25
Bar	— @ 4 50
Sheet	5 62½@ 6 12½
Pipe	4 87½@ 5 37½

SHOT.—The market is steady with only a fair jobbing demand reported.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

IRON.—There is nothing new to report in the market either here or at the East. The consumption is very heavy in this country, stimulated by low prices. Notwithstanding this, the exports to Europe are increasing. This shows very large production.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The market is essentially unchanged. The imports are less, as is the quantity on passage. This makes a firm market for spot and near-by. Distant cargoes are easier, owing to prospects of a large wheat crop in this State.

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

ANTIMONY.—The market is steady.

Our market is quoted at 7½@8½c in a jobbing way. New York mail advices quote 7½c for Cookson's, 7@7½c for Hallett's and 7c for Japanese.

NAILS.—The market is steady to firm.

Wire, carloads, basis per keg			
" jobbing, " "			$2 25
Cut, carloads, " "			
" jobbing, " "			2 10

SPELTER.—The market is steadier.

We quote our market in a jobbing way at 5 cents a pound.

NICKEL ANODES.—The markets here and at the East are firmer.

PLATINUM.—Dealers report a slow inquiry.

Our market is quoted in a jobbing way at $10 to $15 per ounce.

ZINC.—The market is steady at quotations.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is firm.

We quote in jobbing lots at 50 cents per pound for ingots.

BISMUTH.—There is nothing new to report.

Our market is quoted in a jobbing way at $1.50 a pound.

PHOSPHORUS.—The market is slightly steadier.

We quote in a jobbing way at 70 to 75 cents per pound.

Chemicals.

The market is firming up at the East in anticipation of tariff legislation. While our market is not quoted higher, yet it is quite firm with a tendency to advance prices.

BONEASH.—The market is unchanged.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

CAUSTIC SODA, 60%.—The market is more active, but steady at 2½c per pound in a jobbing way.

SODA ASH, 58% (LeBlanc process).—The market is quiet but steady at $1.70 per 100 lbs. in a jobbing way.

HYPOSULPHATE OF SODA.—There is a better demand at 2½c a pound from stores.

NITRATE OF SODA.—Advices from the East report an improving demand at firmer prices.

Our market is quoted from store at 4c for 95%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½c per pound in carboys.

SULPHURIC ACID.—The demand is fair. We quote in a jobbing way at 1½c per lb for 66%.

BLUE VITRIOL.—Our market is more active.

We quote in a jobbing way at 4½c per pound.

Mining Share Market.

SAN FRANCISCO, April 8, 1897.

The activity reported last week has continued since. There was an advance under the lead of Con. Virginia up to Wednesday morning, when the shares sold at $1.65, Ophir at $1.15 Chollar at $1.25, and the rest of the list in proportion. It is said that the advance was due first to outside buying on bull points while the higher prices for Con. Virginia and Ophir caused quite a number of shorts to fill. The latter were chiefly small short sellers who fly to cover at any moves indicating much of an advance. It is said that there are some shorts out on Con. Virginia and shares in two or three other mines but it will require more than a 50 per cent or even 100 per cent raise to make them fill. Some day they may be compelled to fill at a heavy loss for the chances for finding a big body of good to high grade ore in one or more of the mines are not exhausted by any means. While the unexpected is liable to occur, as it has several times in the past, yet the work that is being prosecuted does not point to favorable results in the near future, but it does indicate more assessments. A report came to hand from Virginia City that in Best & Belcher shaft No. 2, Brunswick lode, they have struck ore. Whether the report is correct or not the writer has no way of verifying but experienced miners have held to the opinion that when desired more ore and higher grades could be found north of Savage than has been found south of that mine. It is the belief among miners that sometime the Brunswick lode would be worked so as to make it possible for mines located on it to pay dividends. At this writing it looks as if that time is in the dim future, possibly after the old and rich men belonging to the inside pool are gone to their last resting place and younger men in charge.

Only $206,898 assessments levied on shares of mines located in Nevada fall delinquent in this month. More assessments will fall delinquent next month, the month afterward, so on ab libitum. These assessments are a rich lead for some persons, but it is safe to say not for those on the outside so unfortunate as to own shares. Some of the companies collect assessments and have not had even one miner at work for months before levying it, while others have two at work and from six to ten supernumeraries. On the pay roll there are several companies that have quite a number of miners at work but they are worked in such a way as not to strike ore of much value or size.

From the Comstock mines the news continues unimportant—too many shares out and the business and financial conditions of the country not as yet justifying an attempt to make a big deal. In Utah they are still running east from the old south drift. No change in material is reported. At last the Superintendent of Sierra Nevada has made a strike, which must afford some satisfaction to shareholders, even if it is water, which has been struck in the west crossdrift on the Layton tunnel level. In Union they are exploiting the 900-foot level in almost every direction except that which would lead to a strike of ore. The west crossdrift on the 1000-foot level in Mexican has been stopped after being driven ahead nearly 400 feet. The writer stated some time ago this would be done when within a short distance of ore. But this assertion can be made regarding the work in any of the mines. In Ophir they are still drifting west on the 1000-foot level. This ought to be stopped before long or else they will strike ore. In Con Virginia they are still "pegging away" on the 1000-foot, 1550-foot, 1650-foot and 1750-foot levels. The work on these levels is of the same character reported by us for two weeks past. Unless more ore is taken out in the near future than for several weeks past another assessment will have to follow the one now on. They are making slow progress very fast in the Best & Belcher and Gould & Curry joint east crossdrift. Fully 6 feet was run last week. Nothing was struck outside of porphyry. In Savage nothing new is reported by the Superintendent. The official letter from Hale & Norcross reports that they are driving ahead on a west crossdrift from a raise above the 900-foot level. The company sold 32 tons of ore at $15 a ton and 15 tons of old fillings at $1.50 a ton. No work is being done in Chollar. In Potosi they are exploiting the upper levels. Miners say that if the work is in the right direction good results are sure to follow. They are slowly extending the north drift in Bullion. They are still at work on the 500-foot level of Alpha. The management is more desirous of getting shares than ever. Slow progress is being made in the west crossdrift that is being run by Challenge, Con. Imperial and Confidence. Confidence reports extracting a few tons of ore. From Crown Point, Belcher, Seg. Belcher, Overman and Caledonia nothing new is reported in last letters received. In Alta they have run an east drift into East Alta ground. They cut a stringer of fair grade ore.

From the Brunswick lode official letters are unimportant, but private advices state that in shaft No. 2, Best & Belcher, they have struck ore. This is quite important. In Chollar they have commenced work to open up the 600-foot level. A crossdrift is expected to be started soon from the south drift on the 500-foot level. They have resumed extraction

WILL NEGOTIATE with owners or their duly authorized agents only.
WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from T. C. Cox and W. C. Pidge, in the Philadelphia mines, near Columbia, Tuolumne Co., to deposit tailings in Rose and Eagle creeks, and from F. G. Curnow and others, in the Little Grass Valley Mine, near Columbia Hill, Nevada Co., to deposit tailings in an old reservoir, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal. on April 19, 1897, at 1:30 P. M.

STOCKHOLDERS' MEETING. Notice of Stockholders' Meeting of the Steeple Rock Development Company: In accordance with a resolution passed by the Board of Directors of the Steeple Rock Development Company, a meeting of the stockholders of this company will be held at 3 o'clock in the afternoon on TUESDAY, the 11th day of May, 1897, at its principal office, No. 320 Sansome street, room 24, San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Million Dollars, in four hundred thousand shares, at the par value of five dollars each.

H. PICHOIR, Secretary.

Dated at San Francisco, Cal., March 26, 1897.

STOCKHOLDERS' MEETING.—Notice of Stockholders' Meeting of the Alaska Juneau Gold Mining Company. In accordance with a resolution passed by the Board of Directors of the Alaska Juneau Gold Mining Company, a meeting of the stockholders of the company will be held at 2 o'clock in the afternoon on WEDNESDAY, the 21st day of April, 1897, at its principal office, room 23, 320 Sansome street, San Francisco, to consider and vote upon a proposition to increase the capital stock of this company to Five Million Dollars, in five hundred thousand shares at the par value of ten dollars each.

R. M. MEIN, Secretary.

Dated San Francisco, Cal., March 13, 1897.

NOTICE TO CONTRACTORS.

The Monterey Power Company invites bids for putting in its entire plant, dam, flume, wheels, electrical apparatus and pole line from Little River (22 miles south of Monterey City) to Monterey and Salinas City, for the generation and transmission of electrical current of not less than 450-horse power; entire distance being approximately 37 miles.

Bids will be received up to SATURDAY, April 17, 1897, at 2 o'clock P. M., at the company's offices, Monterey City, Monterey County, Cal., where plans and specifications may be seen.

All bids must be accompanied by a certified check for ten per cent of the sum of such bid. Checks to be payable to the company and to be held upon the usual conditions.

By order of the Board of Directors.

F. A. BOTSCH, Secretary.

WANTED.

Position as Prospector or Mining Engineer for New Mining Company.

First-class assayer, millman, miner and cyanider. Eighteen years' experience in coast mines. Bonds furnished if desired. Address L, Mining and Scientific Press Office.

An Experienced Millman desires position in a mill. Has had several years' experience in different parts of California. Understands concentrators. Good reference given if required. Address "Millman," Mining and Scientific Press.

An Experienced Millman desires a position. Has had several years' experience in different mining districts. Understands concentration and assaying of ores. Good references given if required. Address Box 25, Mining and Scientific Press Office.

WANTED---Situation by Assayer and Metallurgist.

Sixteen years' experience in assaying and milling. Address H, care of Mining and Scientific Press.

Assessment Notices.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company. Location of principal place of business, San Francisco, California. Location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of March, 1897, an assessment (No. 81) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 45, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of April, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 3d day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 45, Nevada block, No. 309 Montgomery street, San Francisco, California.

HALE & NORCROSS SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of March, 1897, an assessment (No. 111) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 11, 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of April, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 14th day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, 331 Pine street, San Francisco, California.

SEG. BELCHER AND MIDES CONSOLIDATED Mining Company.—Location of principal place of business, San Francisco, California; location of works, Gold Hill Mining District, County of Storey, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 6th day of April, 1897, an assessment (No. 19) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 309 Montgomery street, Room 50, Nevada block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on SATURDAY, the 29th day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—No. 309 Montgomery street, Room 50, Nevada block, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 24th day of February, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on FRIDAY, the 26th day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on FRIDAY, the 21st day of May, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 26th day of March, 1897, it was resolved that any stock upon which the above assessment shall remain unpaid on SATURDAY, the 24th day of April, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 19th day of June, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

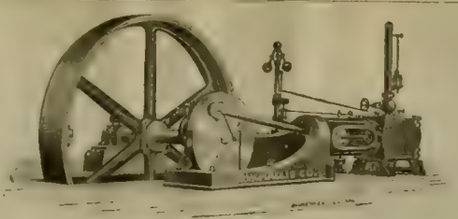
OFFICE OF THE HALE & NORCROSS SILVER Mining Company, Room No. 11, San Francisco Stock and Exchange Building, No. 331 Pine street, San Francisco.

To the stockholders of the Hale & Norcross Silver Mining Company and to all others concerned:

Notice is hereby given that, pursuant to the consent, in writing, of the holders of two-thirds of the capital stock of the Hale & Norcross Silver Mining Company, duly filed in the office of said company, the principal place of business of said Hale & Norcross Silver Mining Company has been changed from Room No. 3 of the San Francisco Stock and Exchange building, No. 331 Pine street, in the City and County of San Francisco, State of California, to Room No. 1 in the same building, where the business of said Company will be hereafter transacted. This notice is published in accordance with Section 321 of the Civil Code.

Dated March 19, 1897.

By order of the Board of Directors.



R. R. GRAYSON, Secretary.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY.
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

California Petroleum.

Probably no other mining industry in California enjoyed last year a greater increase of prosperity than that of petroleum. Although complete returns have not been received, Statistician Yale states that while the yield of 1896 in barrels will be shown to have been but slightly more than that of 1895 the value has been far greater, owing to better prices having been obtained. There were produced, in 1895, 1,245,339 barrels, valued at $1,000,235. Far better prices were obtained in 1896 than in 1895 owing to an increased local consumption, better means of storing and an increase in the amount shipped to this city and other distant points.

The great question now before the oil producers is how to obtain a wider market for their product, and especially to arrange for shipping facilities to the city of San Francisco. The larger concerns can and do ship, and, as a consequence, they obtain far better prices for their oil than do the smaller producers. The fact that the prices in 1896 went up to nearly double those of 1895, without a large widening of the field to be supplied, speaks very well for the future outlook of the oil industry in California.

OIL WELLS IN LOS ANGELES CITY.

In 1893 the yield of petroleum amounted to 470,179 barrels, valued at $608,092; in 1894 it was 783,078 barrels, valued at $1,064,521, and in 1895, as stated, 1,245,339 barrels, valued at $1,000,235.

Los Angeles leads all other counties in the product, and the output for 1896 was probably a little short of that for 1895, which amounted to 979,695 barrels, valued at $732,817. In Ventura county, the second largest producer, the yield was slightly increased over that of 1895, when it was 244,000 barrels. In Santa Barbara many new wells have been bored, and the yield, which was about 16,000 barrels in 1895, was more than doubled in 1896. Small quantities come from Fresno, Kern and Santa Cruz counties. There has been considerable prospecting in other counties from San Diego as far north as San Francisco. The State Mineralogist announces that he will have as soon as possible a map prepared of all the district, from San Francisco south along the coast, showing the location of known oil districts, and will have the field work continued until all the ground has been thoroughly covered by his deputies.

Bulletin No. 11 on "The Oil and Gas Yielding Formations of Los Angeles, Ventura and Santa Barbara Counties," by W. L. Watts, issued last week by the State Mining Bureau, covers the territory in these three counties in which oil wells have been bored very well, and the work will be of great value in those districts. Mr. Watts is now at the Puente wells and H. W. Fairbanks is in San Luis Obispo looking over the geological formations, especially with regard to the indications of the presence of oil. This work will doubtless be continued by the Bureau and will be of great value to those who desire to prospect for oil, and will in many cases save unnecessary expenditure of money. The cost of prospecting for oil is heavy, and the geological work done by the Bureau will consequently be of much value. Mr. Cooper is himself writing another bulletin to be published soon on the oil industry.

In discussing the use of oil for fuel, Mr. Watts states that on the locomotives of the Santa Fe, between Barstow and San Diego, an average of results on a freight engine show that four barrels of oil did the same work as 2200 pounds of Nanaimo coal. Taking coal at $6.65 per 2000 pounds, and oil at $1.33 per barrel, which is near the highest prices reached, a money saving of 27.1 per cent is effected. Other cases are given where a saving of over 50 per cent was effected on overland passenger trains by the use of oil, instead of coal, even when the price of oil was over $6 per 2000 pounds.

Frederick Salathe, Ph. D., contributes in Bulletin 11 a paper giving a resume of original researches, analyses and refining methods of petroleum, in which he has the following to say as to its origin:

The opinions on the origin of petroleum still differ widely among chemists, but through the classic researches recently made by Engler, who has produced the complete series of paraffins, identical with the petroleum-hydrocarbons, by synthesis from fish oils under pressure during distillation, the theory of animal origin of petroleum has become most plausible.

The question has been asked: What has become of the nitrogen, if petroleum was formed of marine animals, and why are most of the petroleum-hydrocarbons free from nitrogen combinations?

Analysis of some natural gas from a well in Pennsylvania shows the presence of nitrogen in natural gas, which in one instance amounted to 23 per cent by volume.

In 1892 I began an investigation on the hydrocarbon series constituting the Ventura county crude oils, which I found to contain invariably from 0.75 to 3.5 per cent of nitrogen. The experiment was conducted in such a manner as to ascertain in what form or combination the nitrogen existed in the crude petroleum, with the view of isolating the nitrogenous hydrocarbons.

The result was the identification of a number of organic bases of the Pyridin and Chinolin series, which heretofore were found only in the so-called animal tar from the distillation of animal cadavers or bones.

The presence of these organic bases in the California petroleum indicates, therefore, clearly the origin of this petroleum from animal matter furnished by the slow decay of a marine fauna, which became extinct by changes of the sea water through local influx of saline mother liquors.

As to the refining, Mr. Salathe gives the following conclusions:

From the investigations given so far, it is evident that the refining of the crude California oils is not an easy task and that they require refining methods different from those practiced with Eastern or Russian oils.

The complicated nature of this class of asphaltic crude oils necessitates complete elimination of all unstable hydrocarbons by inexpensive practical processes. Another great difference exists between the specific gravities of Eastern oil distillates and those of California oils. Viscosity of distillate or reduced stock being equal, the gravities are from 5° to 6° B. lower in California oil fractions than in those of Eastern oils. Flash and fire tests are from 10° to 30° F. lower in California oil distillates than in Eastern distillates of the same gravity.

The accompanying illustration, from the State Mineralogist's report, shows the forest of rigs in the oil section of the city of Los Angeles.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 220 Market Street, Northeast Corner Front, San Francisco.

☞ *Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

Our latest forms go to press on Thursday evening.

J. F. HALLORAN.....General Manager

TO THE PUBLIC.

No one is authorized to solicit business for this paper unless in possession of proper credentials and regularly numbered and stamped blank subscription receipts.

San Francisco, April 17, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Oil Wells in Los Angeles City, 321. Map of Grass Valley and Nevada City, Cal., 324. Collapsed Furnace of the "City of Everett:" Cross-Section of the "City of Everett," Showing the Blow-Off Pipes; Bolthoff Combined Noiseless Gear and Friction Hoist, 328. Motor Car with Four Loaded Freight Cars; Motor Car with Four N. Y. C. & H. R. Passenger Coaches with Trolley Used for Moving the Cars Around the Yards where the Third Rail Is Not Laid; View of Track Showing Third Rails, 329.

EDITORIAL.—California Petroleum, 321. Mr. Evans' Article; The Mint Report; Nevada's New Mining Law; The Passing of District Rules and Regulations; The Prospector; The Oregon Mineral Land Bill; University Extension and Mining, 322.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 326-7.

SCIENTIFIC PROGRESS.—Proposed Polar Exploration; The Economic Element in Technical Education, 328.

ELECTRICAL PROGRESS.—Experimental Railroad Work, 329.

MECHANICAL PROGRESS.—H. P. of a Steam Boiler; Cast Iron; An Arrangement of Fast and Loose Pulleys, 329.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 318-9.

MISCELLANEOUS.—Concentrates, 323. Grass Valley and Nevada City, Cal., 324. Practical Notes on Hydraulic Mining, 325. Coast Industrial Notes; Recent California Mining Incorporations; Recently Declared Mining Dividends; Personal, 331. List of Patents for Pacific Coast inventors; Notices of Recent Patents, 334.

Mr. Evans' Article.

In the issue of the 10th inst. was begun an article entitled "Practical Notes on Hydraulic Mining," by George H. Evans of Oroville, general manager of a number of mines in Butte county owned by English capitalists. Mr. Evans, while a skilled engineer, appreciates the need that the large majority of miners have for rules for calculating as to water ditches, pipes, etc., that are not too technical and may be used by any one familiar with the common rules of arithmetic. In this work he is making available to many the best results of the work of hydraulic engineers. Besides this, much of the data given, gathered from practical experience, will be found of as much value to the mining engineer as to the miner.

University Extension and Mining.

When Levi Strauss of San Francisco last month established twenty-eight scholarships in the State University the Governor addressed him a letter of thanks, in which he took occasion to say: "I have long contemplated a change in the local character of the normal schools of the State, so that they might subserve the purposes and, in fact, constitute branches of our State University, so that students could practically attend the State University for, perhaps, the first two years near their own homes and there receive absolutely similar instruction to that at the parent institution and by the same professors."

In this column some time ago it was suggested that the faculty of the School of Mines at the State University devise some scheme by which young men in the mining districts would be enabled to do part of the work required of candidates for the degree of mining engineer at their homes. The establishment of local schools of mines would, of course, be out of the question; but there young men could be given directions for the study of geology, mineralogy and, in many cases, chemistry in the mines. A little practical work done in any of these sciences would enable those who propose to enter the School of Mines at Berkeley to obtain degrees in much less than the time usually required. There is no reason why each mining town of any consequence in this State should not have a good working collection of minerals. This, and university extension lectures by the professors from Berkeley, would make a beginning. There are many good purposes that the mineral collections from the mines of any county would subserve besides that of education, and there should be no difficulty found in forming them.

The Prospector.

Now comes the season when the nomadic prospector will be heard from in the north. During the past winter he has done good work in Arizona, New Mexico and in southern California, and as a result there have been more reports of the discovery of valuable mines and the opening up of new districts in that part of the country during the past three or four months than there has been for several years before. What is best about it all is the fact that capitalists or representatives of capital have paid attention to these reports and followed them up, and as a result a great deal of development work is being done and the prospector's labors will not go in vain so much as they have in the past decade and a half, during which the mining industry has been in the dumps and men of means have sought other sources for investment. For many years back the prospector's reports have not been noticed—even when he has made valuable discoveries. He has been neglected, looked upon as about "played out" and treated with scant courtesy by capital. Now this is all changed. Capital keeps an eye on the prospector and is very glad to give heed to him.

It is not uncommon nowadays for men of means, interested in mines, to engage on a salary skilled prospectors to go out and look for mines. In all cases, in addition to the pay, which is generally small—a little more than enough to cover expenses—there is the promise of an interest in any discoveries made. This is of course an outgrowth of the old system of "grub-staking," which, too, is still in vogue. Many of these prospectors so sent out are men of considerable education, with a good knowledge of mining geology and assaying.

Like the men of wealth and leisure, or like the birds, the independent prospector, in a measure, has his winter abode and his summer resort. Many of those who have lately been in the more congenial winter climates of the south, are now making their way north. Alaska is fast filling up with prospectors for the season. They will not go to the Yukon placers nor search for labor in the quartz mines already opened; they will go farther afield and prospect for quartz in comparatively unknown districts of the great northern province. Whether there shall be much greater interest taken in the Alaska quartz mines later in the season or next year, will depend largely upon what account is rendered by the prospectors.

In Rossland, Trail and other towns of British Columbia, in the Kootenay district, a few days ago, were hundreds of prospectors camping on the rear of winter. Now the snows are melting and they are making their way north, and, in many cases, far beyond where any mining has heretofore been done. There are few better fields, too, for an immense country, virgin to the prospector, lies ready for his wooing. So, too, in Idaho, Washington, Montana, Wyoming, South Dakota, and in the higher altitudes of Utah, Nevada and Colorado, as the snows melt, the prospectors are making their way for their summer outings. Reports of the discoveries of new mines and new mining districts may be expected for the next six months from the north, rather than from the south.

Nevada's New Mining Law.

The State of Nevada has just adopted a law relating to the location of mining claims, mill sites and tunnel rights, which is an exact copy, with the exception of one sentence, of the bill prepared for the MINING AND SCIENTIFIC PRESS, and published in the issue of October 31st last for the consideration of the California Miners' Convention and the State Legislature. It has several advantages over the new California act. One of these is in that it specifically defines what number and sizes of posts shall be set up to properly mark the boundaries, and will stop a very fruitful source of litigation. As to the amount of work to be done to hold a location, the bill provides that, within ninety days after the posting of the notice, the locator must sink a discovery shaft to a depth of at least ten feet or run a cut or tunnel equivalent. The act, which is made up mainly from the best practices in other States and Territories, covers the ground very thoroughly and is in accordance with the requirements of practical miners.

The Mint Report.

The annual report of the director of the Mint of the United States for the fiscal year ending June 30, 1896, has been received. Some of the information contained has been given to the public by the director through the press, but much of it that would have been of value and more interest if published before it became ancient history is now given out for the first time. The main value of the publications of the Government is lost in the delay in printing them and giving them out to the public. Until a few years ago the publications of the United States Geological Survey were of little practical value for this reason. Now it is generally acknowledged that a great deal of interest is being taken in the work of the Survey because it is more timely than it was and there is less delay in giving out the results. This report of the director of the Mint is nearly a year behind time and comes after interest in the period covered has considerably died out.

As to gold of domestic production, the deposits during the fiscal year ending June 30, 1896, were valued at $53,910,957.02, while those for the previous year were $44,371,948.83. As practically all the gold produced was sent to the Mint, this gives a pretty accurate idea of the great increase in the yield of that metal. As to silver, the deposits at the Mint tell very little as to the product. The total value of the silver bullion received during the year of domestic production was $5,716,742.64, as compared with $8,804,363.43 for the fiscal year ending June 30, 1895.

The Oregon Mineral Land Bill.

In southern Oregon the miners are beginning to feel the need for the passage of the mineral lands bill, presented in the United States Senate by Senator McBride, providing for the segregation of agricultural and mineral lands under the railroad grants—similar to the mineral land bill proposed for California. The newspapers of southern Oregon are exposing the methods of the railroad, whose representative says that there is a mistaken idea among the people to the effect that the railroad company wants to gobble up the mineral lands. On this subject the Rogue River *Courier* says:

The people residing in the mineral belt of southern Oregon have had these same sentiments preached to them for several years, notwithstanding mineral claimants find they must go to much trouble and expense to defend their claims from the railroad land grant patents. Possibly the fault is with the General Land Office, which by its ruling throws the burden of proof upon the mineral claimant. It is hoped that through the new Commissioner, Mr. Hermann, who should be familiar with the situation, the ruling may be modified to throw the burden of proof upon the company, or otherwise simplify the miner's procedure. There is good ground for maintaining the position that the bulk of the railroad lands claimed in southern Oregon are mineral, and would be found to be so upon examination. But patents have issued for a vast amount of these lands to the railroad already.

The Passing of District Rules and Regulations.

The new mining law of Utah, as to the location of claims upon the public domain of the United States, provides—as does that of California—for the recording of all notices with the county recorder. This more than anything else tends to do away with the necessity for local mining districts. In Utah the principal objection urged against the bill was this clause; but in California less was heard on this point, mainly because in many of the old camps for years there has been no local recorder and in very few has the old district organization been kept up. It would seem as if the day for the district rules and regulations had about passed away. New Mexico, Arizona, California, Utah and other States and Territories have practically all adopted laws that will be found ample for any mining district in any of the States named. However, these laws are not perfect, and new districts in some cases may consider it necessary to supplement them with local rules and regulations. It is to be hoped that they will, especially in California, so that there may be given trial of rules that in time should be incorporated in the law of the State.

Concentrates.

THE shaft of the Geyser mine at Silver Cliff, Colorado, is down 238 feet.

SOME Nevada county, Cal., mines are now using coal from Corral Hollow.

A DISCOVERY of copper-gold ores near tide water has been made on Prince of Wales island, Alaska.

COPPER, not being specially provided for in the Dingley bill, goes into the general 10 per cent ad valorem class.

THE gold yield of Victoria, Australia, for January, 1897, was 52,238 ounces against 50,878 ounces in 1896 and 23,477 in 1895.

ALL steamers going to Alaska are loaded with miners and their outfits, most of them on the way to the Yukon country.

STEPS are being taken by the Mines Department of New South Wales to issue the returns of the yield of gold quarterly.

THE Golden Cycle Mining Company of Cripple Creek has ordered four 150-horse power boilers and a 12-drill air compressor.

SENATOR MCBRIDE has introduced in Congress a bill providing for the examination and classification of mineral lands in Oregon.

THE opal mines in Owyhee county, Idaho, formerly owned by Anchor, Shirley & Co., have been sold to a Philadelphia company.

THE town of Carlin, Nevada, is considerably excited over the discovery of gold-bearing placers near that place, on the Humboldt river.

THE proprietorship of the Broken Hill Proprietary Company is gradually drifting to London. Transfers to the London register are numerous.

THE statement of the condition of the United States Treasury April 9 showed: Available cash balance, $225,410,052; gold reserve, $153,114,438.

AT Nevada City, California, the Champion Mining Company and the Providence people contemplate the erection of chlorination plants at these mines.

ACCORDING to the Gold Creek (Nevada) *News*, from 200 cubic yards of gravel along the bed of Van Duser creek there was cleaned up a few days ago $4916.12.

ARTICLES OF INCORPORATION have been filed in Portland, Oregon, by a company bearing the novel name of the McKinley Gold and Bryan Silver Mining Company.

THE Santa Fe Company has been having some borings made for oil near Fullerton, Orange county, and last week at a depth of 510 feet struck a flow of five barrels per day.

THE hoisting works at the Poorman & Hastings drift gravel mine on Harmony ridge near Nevada City, Cal., was destroyed by fire last Monday. The loss was about $4000.

THE Holliday Coal Company, which is opening up some new coal mines near Price, Utah, have a vein of anthracite 9½ feet deep, from which the first shipment to Salt Lake sold at $7.50.

THE Southern Pacific coal mines at Red Canyon, Utah, produce 500 tons a day, all of which is consumed by the company. The workings in the measure have reached a depth of 1800 feet.

THE Travertine Company at Bridgeport, Cal., has sold three-fourths of its stock to an English syndicate for $125,000. The new owners will erect a better plant for working the stone.

A SMALL herd of cattle was driven into the Yukon country by the Chilcat pass last summer as an experiment; the plan was found to be feasible, and a larger herd will be taken in this summer.

WHAT promises to be of interest to the mining industry is the opening of parts of the Eastern and Southern Ute Indian reservations in northwest Colorado, which will probably be done this summer.

THE London *Economist* of the 10th inst. shows that forty-one Rand, South Africa, mining company stocks on the Stock Exchange have declined from £121,000,000 to £43,000,000 the past eighteen months.

AT the first election in Rossland, B. C., last week, 1067 votes were cast, and Robert Scott, who was chosen Mayor, announced that he would oppose anything savoring of the nature of a "wide open" town.

THE Greek boys' property near Berners Bay, in Alaska, has been placed in Butte, Montana, for $60,000. A tunnel will be run to open up the ledge and a 10-stamp mill erected under the management of E. D. Lutes.

UTAH'S new mining law, passed over the Governor's veto, goes into effect May 10th, after which date all locations must be filed with the County Recorder, and within ninety days $50 worth of work must be done on each claim.

IN the blue clay, at a depth of 30 feet, in the old Hupp & McMurray mine at Weaverville, Trinity county, Cal., lately, about a cord of cedar wood was found. It was not petrified, but charred, and must have been there many ages.

THE oldest tunnel known connected the Pool of Siloam with a spring outside Jerusalem. From an inscription discovered in 1880 it appeared to have begun from both ends. The work dated from the time of Hezekiah, or even of Solomon.

THE Vulture mine at Phœnix, Arizona, formerly owned by ex-Senator Tabor of Colorado, which has produced over a million, has been sold to W. B. Davis of Tucson and H. M. Love of Chicago, who will construct a mill and cyanide plant.

THE output of Cripple Creek has been steadily increased for several months, and so far this year averages, according to conservative estimates, nearly a million. Most of the increase has come from the increased amount of low-grade ores worked.

VIEWED purely as a commercial proposition, the matter of good roads is an important one to California manufacturers of mining machinery. It is to the interest of every man furnishing mine supplies to have improved roads throughout the State.

A LONDON press dispatch states that there are indications that the British are making preparations in many directions for trouble with the Transvaal. During the week two more regiments have been notified to prepare for service in South Africa.

IN the Canadian Parliament a bill has been introduced, and supported by the premier, giving the Government power to place restrictions upon the employment of alien labor, with a view to retaliating against any similar legislation in the United States.

THE European consumption of copper for the first two months of this year has been much larger than for the same period of 1896, and the increase in England, France and Germany is estimated at 8354 tons. The imports of copper into Germany during 1896 were 73,123 tons, against 59,742 in 1895.

A MAIL CARRIER from the Yukon mines in Alaska reports that flour is selling at $1 a pound and ham at $7.50 a pound. He states that many miners are rushing into the country without sufficient provisions. Few of those who go best supplied will have more than enough for their own use.

A GOOD many hard things are at present being said against Gov. Budd for his action in vetoing some appropriations. So far as the miners are concerned he was just and kept his word, acting exactly in accordance with the promise made at the Miners' Convention in this city—after his election.

PEOPLE who lately leased the Ajax dump at Tintic, Utah, are shipping on an average 100 tons a month of ore which was taken from the mine from ten to twenty-five years ago, and which was then considered too low grade to ship. The average value of the ore which they are shipping runs about $30 a ton.

THE Colorado Springs *Mining Investor* complains that the London International Bourse (Ltd.) of London is selling cheap Cripple Creek mining stocks at a price far in advance of what is being offered for them in Colorado. One stock that is sold in Colorado Springs at 5 cents per share is offered at 50 cents in London.

THE Le Roi Mining Company of Rossland, British Columbia, has been considering the advisability of increasing its capital from $2,500,000 to $5,000,000, and at its last meeting decided not to do so. The directors state that offers have been received from English capitalists to purchase the property for $4,000,000.

IT is proposed by the Government of West Australia to establish a Government assay department, metallurgical works and a school of mines, to subsidize smelting works, erect public batteries at various centers, etc. It will not be the fault of the Government if the miner is not contented with his lot.

ELMORE & VAN DUSEN of Green Bay, Wisconsin, have secured options on the Minnesota and National copper mines at Rockland, Ontonagon county, Michigan. These are mass mines and paid nearly $2,000,000 in dividends in the early days of Lake Superior mining. Both have been idle for more than ten years.

IN Nevada City, California, the Providence and Champion mines are reported to be under examination by English syndicates with a view to their purchase. Captain Thomas Mein and Henry Bratnober, representatives of the Exploration Company of London, have been examining the Nevada City and Muller and Walling mines.

THE provincial government of British Columbia has announced its railway policy to be to provide for a loan of $2,500,000, out of which cash subsidies of $4000 a mile are to be given to the railway from Penticton to Boundary Creek, 100 miles; a railway from Butte inlet to Quesnelle, 230 miles, and one from the coast to Chilliwick, 60 miles.

CONSIDERABLE interest is being taken in the attempts to save the fine placer gold along the Saskatchewan river in Canada. Numbers of Americans from Chicago and Nebraska have already commenced work there. There have been several attempts to use machinery for saving this fine gold, but they have proved futile in a large measure.

WITH the opening of spring and summer travel come the usual tremendous tales of rich gold finds, and "the richest gold deposits on earth" is again a familiar head line. An immense amount of prospecting is being done, and doubtless '97 will develop some good properties. Meanwhile the gorgeous imagery of the newspapers is not to be taken too seriously.

THE Arizona *Citizen* says the act passed by the late Legislature entitled to encourage mining and prospecting in Arizona is liable to drive every assayer out of the business. From ten to thirty or more assays are being made daily at the University, while local assayers do not average a half dozen a week. There is neither wisdom nor justice in such legislation.

THERE is in contemplation the sinking of a borehole to a greater depth than has yet been reached in the gold fields of the Rand—some 4000 to 4500 feet. This would be in the dip from the outcrop about 10,000 feet. The Ecksteins and the Consolidated Goldfields will undertake the work at some spot where their interests join, but the exact locality has not been decided yet.

A NEW LAW of Idaho provides that none but citizens or those who have declared their intention to become citizens may be employes in the mines. Manager Huntley last week notified all the aliens at the De Lamar mine to quit or take out their first papers. Most of them declared their intention to become citizens. The constitutionality of the law will be tested in the courts.

THE annual report of the Franklin Mining Company of Michigan shows a production of 2,746,076 pounds of refined copper during 1896. The summary of the year's business gives receipts for the year (including copper unsold estimated at 11¾ cents) of $307,447.99 and total expenditures of $286,789.70, leaving a mining profit for the year of $20,658.29. Net surplus December 31, 1896, stood at $153,487.45.

IN New Zealand satisfactory work in the use of dredgers for mining auriferous gravels has been done. A report just published of the returns of the fifteen companies engaged in this class of mining shows that during 1895 they produced 12,782 ounces valued at £49,535 at a cost of £40,327. Six of the companies worked at a small loss, but several of them were under extraordinary expenses that will not recur.

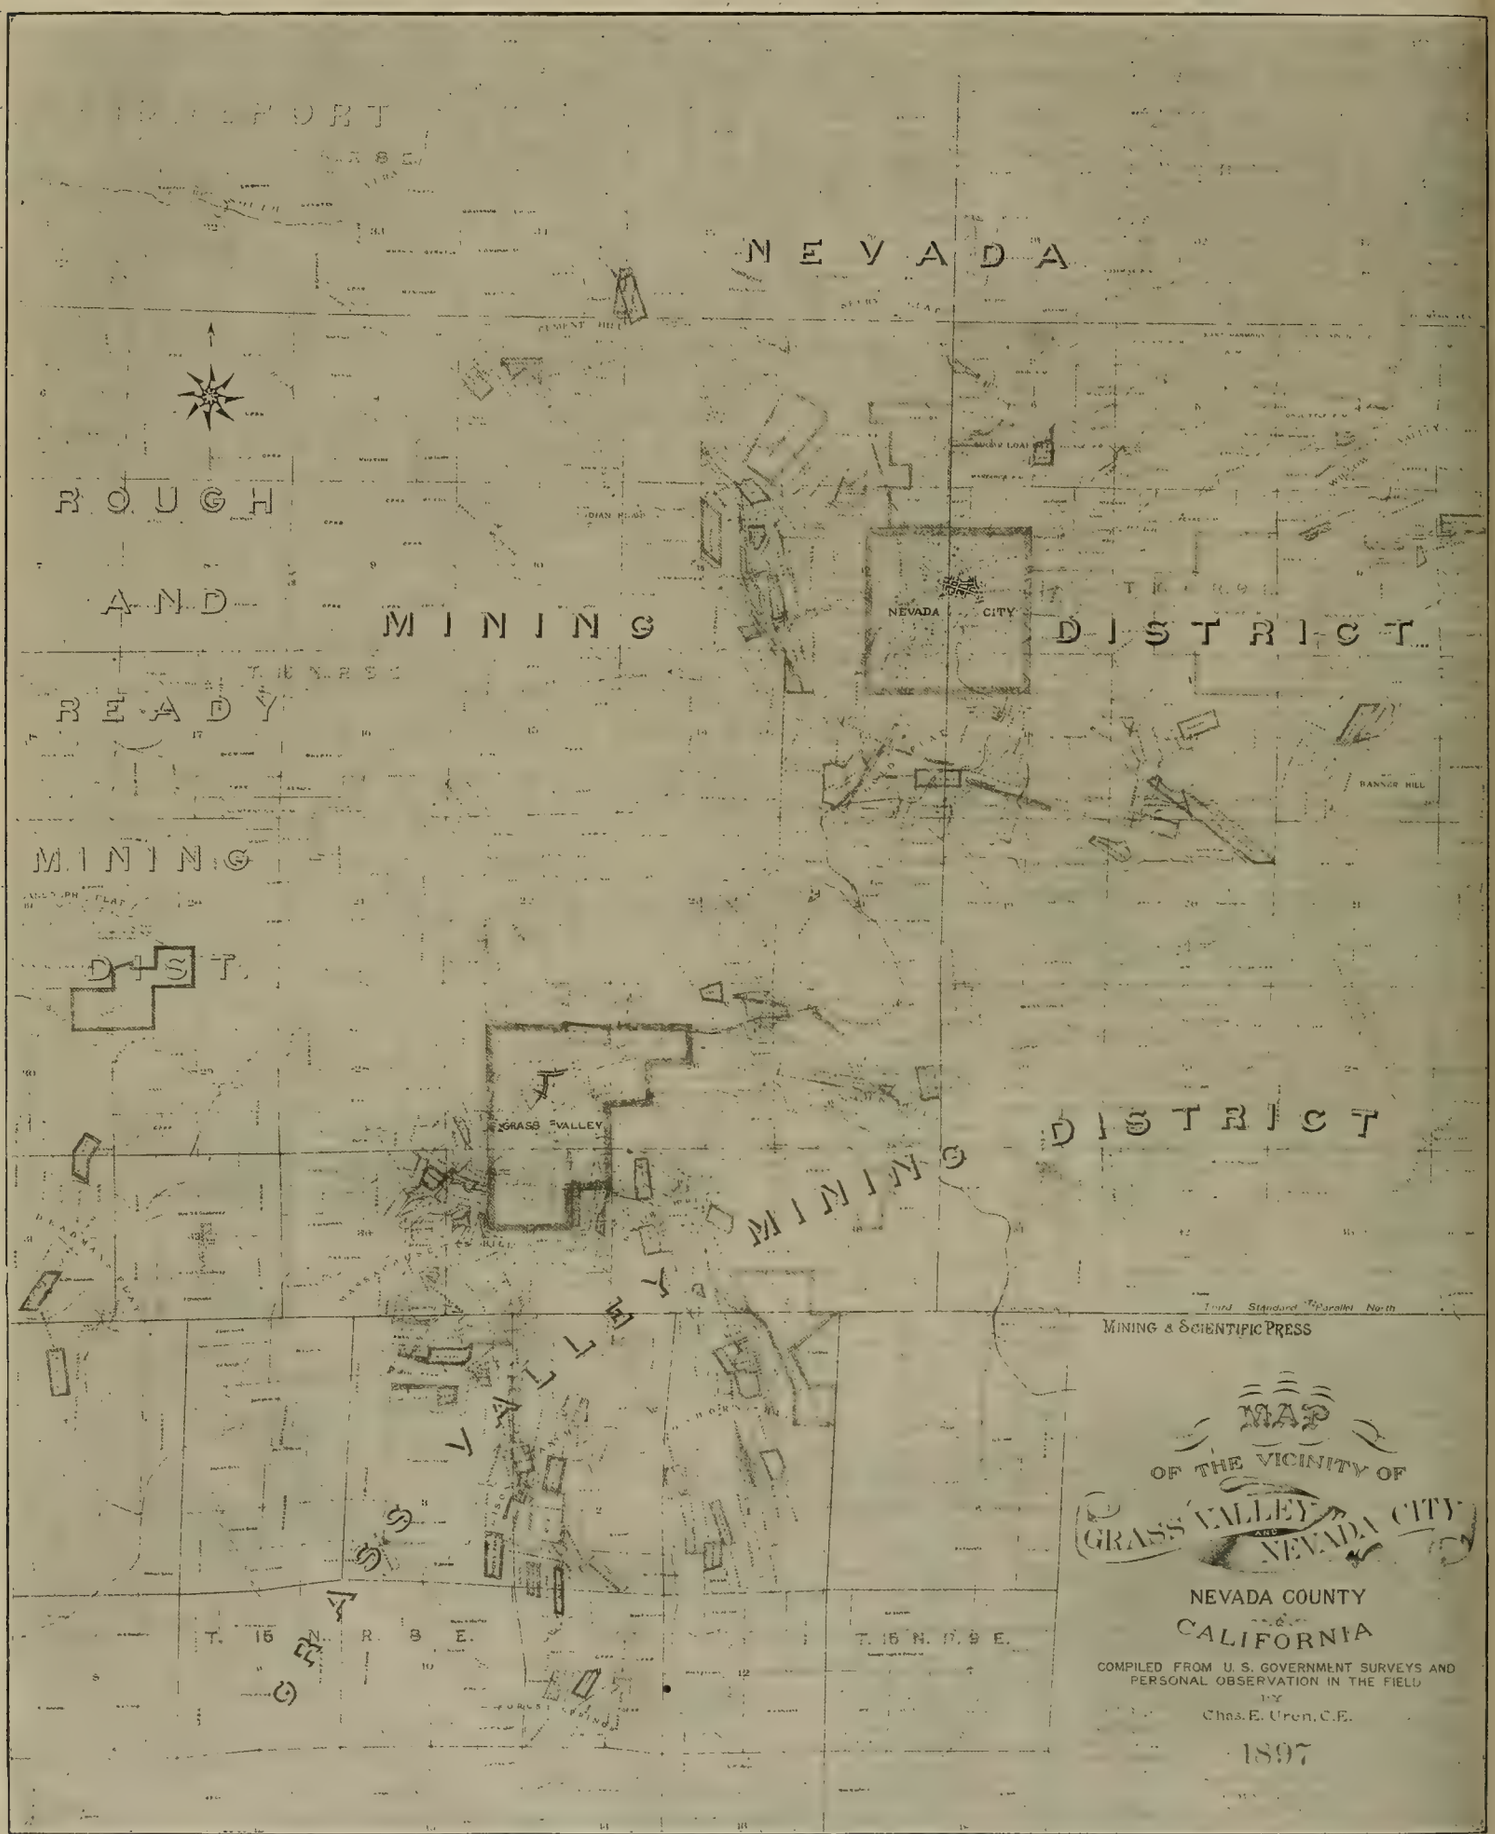
THE annual report of the Osceola Consolidated Mining Company (copper) of Michigan shows the following figures for 1896: Gross receipts, $687,017.85; total costs, $602,908.74; net income, $84,109.11; dividends paid, $100,000; balance of assets, December 31st, $257,171.76; refined copper output, 6,251,304 pounds; total cost per pound, 9.64 cents. A larger construction account charged to running expenses is the cause of the high cost per pound compared with 1895, when it was 8.75 cents.

IN many of the higher altitudes of the California Sierras during winter the only communication between mines and mining towns and the outer world is upon snowshoes. This is especially true of districts in Siskiyou and Plumas counties. At La Porte, Plumas county, last week there were held some snowshoe races, in one of which 1800 feet was run in 15 seconds. This is at the rate of a mile in 44 seconds, more than twice as fast as the best record for race horses and faster than the time of the fastest express trains. It is said that a hurricane holds the best time record for one mile, covering the distance in 30 seconds. A balloon has done the mile in 40 seconds. The third place is held by the California snowshoers; the fourth by a railroad engine in 53.57 seconds.

THE 30-inch inverted siphon pipe of the Cherokee Company in Butte county, which carries water over the west branch of the Feather river, broke last week, but was repaired in a few days. This pipe was put in in 1870 and carries 2200 inches of water. The head is 150 feet and the greatest depression 887 feet. Although it has been in use a quarter of a century, the men who repaired it last week report that none of the rivets are worn to any appreciable extent; even the coating of tar and asphalt that lined the inside of the pipe remains.

PRESS dispatches from Seattle, Washington, and Washington, D. C., state that the United States Government will probably send a squad of mounted police to the Yukon gold fields in Alaska. On the Canadian side of the line the mounted police of the Dominion Government have done good work, and those in the country with good intentions prefer for that reason to be under the care of the British flag. On the American side there is no law nor government except such as the miners chose to make for themselves.

AT a meeting of the shareholders of the Mountain Copper Company, Limited, owners of the Mountain mines of Shasta county, Cal., held in London on March 25th, the chairman stated that the capital of the undertaking was fully absorbed, and was in the hands of over 100 shareholders. They were already producing copper, and there was every prospect of the company being a success. He said about 1000 tons of copper had been sold since January. It was rather too early to go into the cost of production; but, roughly speaking, he should say there was a good profit upon the work done up to date.



THE report of the Drum Lummond mine in Montana, made to the shareholders in London, for the half year ending December 31 shows that the income amounted to $246,294, and that the total expenses were $213,597. Development work shows that it has been energetically continued during the half year, and as a result 4447 feet of levels, shafts and winzes have been completed at a cost of $66,057. All this work is said not to have opened up any large bodies of ore, but a 2-foot pay streak was undercut in the south drift of shaft No. 2. Better results are expected when the cyanide plant now being built begins to work over the immense quantities of tailings and low-grade ore in the dump.

THE annual output of the Isabella Mining Company of Cripple Creek, Colorado, for 1896, shows receipts from smelting ore of $494,043.20, chlorination ore $63,011.54, bullion $6093.28 and concentrates $4892.63, a total of $568,040.65. The expenses were $347,926.44, of which there was paid for milling $191,121.22, treatment charges $76,138.23, transportation $33,277.12, and lessees $33,448.68. The net profits were $220,114.21, out of which $180,000 was paid in dividends. The total mine expense, including all construction plant and dead work, amounted to $4.36 per mine car of rock, including waste hoisted. The cost per ton for the 8630 tons of pay ore hoisted was $22.15, divided as follows: Improvements, $2 60; surface expense, $3.38; mining ore, $8.87; development, $5.12; general expense, $2.18. Of this, $17.63 was for labor and $4.36 for supplies.

THE variety of "circulating medium" is aptly illustrated by mail receipts in the business office of this paper—national bank notes from east of the Rockies, Bank of England notes from Europe, bills of exchange from South America, big Mexican dollars from Mexico, Wells-Fargo express orders, and United States money orders and gold coin from the Pacific coast. The most unique is the frequent receipt of gold amalgam, and a "gold button," the latter mostly from Nevada, Idaho, Arizona and Montana. Usually with the receipt of a gold button comes a letter stating that no money order or greenbacks can be had, and instructing the office to send such and such books and the MINING AND SCIENTIFIC PRESS. The gold thus sent is usually less than an ounce in weight, varying in value from $14 to $18 to the ounce. Postage stamps are also largely received, some foreign correspondents burdening the office with stamps from their countries, which are not accepted by United States postal authorities, and hence not commercially available.

THE tone of some of the English papers in reference to the Transvaal would indicate that there will be trouble in store for Krueger, whether he wants it or not. The London *Mining World*, in a late issue, says: "The present state of things cannot last. This is felt by the entire white population of South Africa, and, as we have already said, it must be mended or ended. In either case, our advice is to buy Kaffir shares. We believe that any announcement on the part of this country in the way of an ultimatum for the distinct breaches of the London Convention of 1884 that have been made will improve prices. Even if this ultimatum led to war, we still believe that quotations would be improved, because there would be a relief to the intolerable strain that is now felt, and particularly by those of our countrymen and of other nationalities who are now resident within the Transvaal. We hope, however, that this ultimatum will not be presented just yet—that we shall, at least, be allowed to get over the Diamond Jubilee celebrations, and in that time we fancy the Boer Government will have had quite sufficient rope to hang itself."

THE assistant manager of an Alaska transportation and trading company, in a recent interview in a paper in the East, where he has been drumming up business for his concern, gives some very misleading information as to the mines of that country. He says that "the area of this placer mining district extends on both sides of the line a distance of 400 miles long by 100 miles wide, but so far as operations are being carried on over a distance of only 30 miles square. The rest of the country is practically unprospected and, although Indians and stragglers frequently bring in nuggets from unworked territory, no attempt has been made to mine outside of the limited territory referred to, because there are not enough men in the country to extend the operations. The gold is gotten out by panning or sluicing, in a primitive way, the sands on the river banks. To show how rich these sands are, one man recently got $208 in gold from a single pan, and another has a claim which shows through 5 feet of gravel, yielding $3 to every pan. Miners are in great demand, and an ordinary shovel-bearer can get from $10 to $15 a day wages for simply digging sand. He can thus earn $1500 to $2000 during the five months of summer which the land enjoys, and his living expenses will not exceed $500 a year." This sort of talk has led many into Alaska, to meet with privations and hardships.

MAP OF GRASS VALLEY AND NEVADA CITY, CAL.

Grass Valley and Nevada City, Cal.

On this page appears a correct, up-to-date portraiture of the vicinity of Grass Valley and Nevada City, Cal., specially engraved for this paper from a map recently compiled by Chas. E. Uren, C. E., of Grass Valley, Cal. The map is on a scale of 20 chains to 1 inch. In connection with this, Mr. Uren has prepared the following:

Grass Valley Mining District.—This district was finally organized at a convention held at Grass Valley July 27, 1872, immediately after the act of Congress of May 10, 1872, governing the location and extent of quartz mining claims. The first section of the local mining laws, passed at said convention, reading: "Grass Valley mining district shall embrace in its territorial extent the same limits as the township of Grass Valley, as defined by law."

The district, as it now exists, contains about 122 square miles of territory, and joins the Nevada mining district on the south. The city of Grass Valley, the metropolis of Nevada county, is situated in the northern part of the district and contains a population of about 8000.

The discovery of gold in the vicinity of Grass Valley dates back as early as October, 1848, the mining at that time having been confined to shallow placers and creek mining.

The first discovery of gold-bearing quartz in California is credited to this district. This discovery marked a new era of prosperity and the creation of a new system of mining.

The honor of the first quartz mill constructed for the reduction of ore has been divided between the

Gold Hill mine of this district and the old Benton mill on the Merced river, on the Mariposa grant, Mariposa county, owned at that time by General Fremont, "the Pathfinder." While the latter mill still remains in its primitive state—a relic well worth preserving to illustrate the evolution of the quartz mill—Grass Valley has been more fortunate and prosperous.

It has unquestionably been since the early mining history of California the most prominent as a gold-producing district. Not only in all mining communities, but in a great many commercial centers throughout the world, may be found men whose recollections take them back to Grass Valley and its earlier surroundings.

To-day we find mining operations carried on more extensively and on a more permanent basis than during any time of its history. The equipment of the mines with power is better than that of any other district in the world. An abundance of water power varying in head from 100 to 770 feet, according to locality; electric power, to the extent of 2000 H. P., brought into the district as a competitor, and the price of wood, ranging from $3 to $6 per cord, are the available facilities for power, thereby reducing the cost to a minimum.

The several means of generating power have been illustrated at the different mines in operation, giving an opportunity to judge impartially the cheapest and most efficient.

The number of stamps in Grass Valley district is 313, of which 238 are at present in operation. There are a total of eighteen mills—six equipped with steam, eleven with water and one with electric power.

There are thirty-four hoists, all of which are provided with steam plants, two of which are also supplied and operated with compressed air and ten with water power.

The pumping capacity of the several plants aggregate over 8000 gallons per minute, or about 730 miners' inches of water—the Cornish system being the general one in use. Among these are three compressed air pumping systems, aggregating 2800 gallons per minute and using the Dow and Knowles pumps.

Over ten miles of hoisting shafts have been sunk on the different mines throughout the district, the most depth on the slope of the vein attained being 3150 feet and a vertical depth of 3182 feet.

There are also over fifty-one miles of drifts and crosscuts run in the development of the many veins, without taking into consideration the upraises and winzes.

The stoped area does not exceed 12,000,000 square feet, which ore could be crushed by the 313 stamps working incessantly in a little over nine years.

The estimated production of gold from the district is $100,000,000, and the largest production of any one mine in the district is a little over $12,000,000.

There are about 250 mining locations, most of which are covered by patent, and varying from the old original "square claim" and those procured under the mining acts of 1866 and 1872.

At present there is more activity in mining than there has been for many years and the future of Grass Valley never looked more promising.

CHAS. E. UREN.

Grass Valley, Cal, March 25th, '97.

The following is from the well known mining engineer, Mr. W. F. Englebright, and was written to accompany the map:

Nevada City Mining District.—This district is situated northeast of and adjoins the Grass Valley mining district, and takes its name from Nevada City, the county seat of Nevada county.

Since the year 1849 it has been the scene of active mining operations—first, in the working of the shallow placers and ravines, which were among the richest discovered in the State, and then the systematic working of the deep ancient river channels and extensive quartz mines. During all this time mining in this district and the production of bullion have been continuous, which, for a record in gold mining, is worthy of note in the history of our State. To-day mining in the district stands on a more permanent basis than ever before, as the developments in recent years in both the gravel and quartz mines warrant a continuation of prosperity for many years to come.

There are now running sixteen hoisting and pumping works, with over two miles of incline or perpendicular shafts, and over twenty miles of tunnels and drifts open, in working shape.

The greatest depth thus far attained is 1800 feet on the incline, making a perpendicular depth of 960 feet, and the most valuable and extensive ore bodies opened in the district were in recent years uncovered in these deep workings.

There are 210 stamps running in the district, with forty stamps on mines not in active operation. All of the mills are of modern construction, fitted up with all the latest improvements for the reduction of ores and gold-saving machinery. Water is used for power under pressure of from 200 to 400 feet, there being about 1000 H. P. used in the district to run hoisting and pumping machinery and mills; the pumping machinery is light, as the amount of water cut in the deepest shafts is comparatively small.

There are two chlorination plants and one smelter in the district.

The estimated production of gold from this district is about $75,000,000.

The annual production of gold in the past few years has been about $1,000,000. The mines of the district now support a population of over 5000, who live in Nevada City and vicinity, and this city is to-day one of the most prosperous in the State.

W. F. ENGLEBRIGHT.

Nevada City, Cal., March 24th, '97.

Practical Notes on Hydraulic Mining.*

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE H. EVANS, C.E., M.E., General Manager Cons. G. Mines of Cal., Ld. Oroville, Cal.

Grades, Capacity, etc.—In connection with the grades and various shapes of water races, the following points require particular attention:

First—As before mentioned, the character of the ground through which the ditch is constructed will have a great bearing on the grade required, but, as a guide, it will be well to remember that practical results have demonstrated that, in ordinary ground, the water should travel at the rate of from 180 to 200 feet per minute. Then the grade will be determined by the dimensions of the ditch, and its intended carrying capacity.

Second—Races in which the water flows at too high a velocity through ground of a porous nature will never be free from leakage, owing to the fact that the velocity of the water will not allow any sediment to settle, and in all ditches properly constructed the sediment traveling with the water at a moderate velocity is always relied upon to entirely tighten up all portions of the ditch cut through ground of a porous nature; and, again, if the velocity is too high, it will scour holes in the bottom and sides of the ditch when constructed in sandy or clay soils. By neglecting these points, the cost of maintaining will unnecessarily be increased.

Third—To establish the grade of a ditch when the velocity and area of same is known, one of the simplest methods of calculation is as follows: Multiply the velocity in feet per minute, by the wetted perimeter, in feet, and divide the result by twice the area in square feet, and the product will be the total fall in feet required to each mile. To reduce this fall to inches, for each 12 feet in length multiply by .027. Example: Suppose we have a ditch to construct for a distance of six miles, to deliver 600 miners' inches, or 900 cubic feet, per minute, or 15 cubic feet per second.

To commence with, we are told that in ordinary ground the velocity should be about 3 feet per second, or 180 feet per minute. Now, knowing the velocity and the distance, the area required is obtained by dividing the discharge in cubic feet per second, viz: 15 by the velocity in feet per second, viz., 3, the result shows that an area of 5 square feet will discharge the quantity of water required, and in order to have the ditch or flume constructed with least amount of friction, the width of the bottom must be from 1¾ to 2¼ times the height of the sides, and in this instance the section of the ditch or flume would be 3 feet in bottom, with 1 foot 8-inch sides.

Having now the velocity and area, we next find the wetted border or perimeter—in other words, the length—of so much of the bottom and sides as is wetted by the water; for instance, if a flume or ditch is 30 inches wide and 12 inches deep, its wetted perimeter, when full, is 30+12+12=54 inches, or 4.5 feet, and the same ditch or flume, if empty, has no wetted perimeter at all. Now, fully understanding the meaning of wetted perimeter, we find that the ditch or flume in our example has a wetted perimeter = to 3 + 1 ft. 8 in. + 1 ft. 8 in. = 6 feet 4 inches, which, for convenience in calculating, we reduce to decimals, and have 6.33. We now have the following results, viz: Velocity, 3 feet per second; discharge, 15 cubic feet per second; wetted perimeter, 6.33 feet.

To find the grade, we first multiply the velocity in feet per second by itself, and in this instance the result is 3×3=9, which has to be multiplied by the wetted perimeter in feet, 6.33; therefore, 9×6.33=56.97, this total has to be divided by twice the area in square feet, viz., 5×2=10; therefore, 56.97÷10=5.69, the total fall in feet per mile. This result is practically correct for flumes and ditches of short length in good ground, but allowance must be made according to the roughness and the contour of the ditch.

A more difficult, but correct, formula, which has been obtained from actual experiments made in connection with ditches constructed in ordinary ground, with the usual winding course and short bends, is as follows: Velocity in feet per second = 6 times the square root of 2×G×R×S. Where G is the acceleration of gravity, or 32.2, R is the hydraulic radius, which is found by dividing the sectional area of the ditch in feet by the wetted perimeter or border in feet, and S, the sine of inclination, or the total fall or grade in feet, divided by the total length in feet.

If the ditch is constructed through rough country and the bottom or sides of same present rough surfaces to the water, then 5 times the square root of 2 g r s will give the mean velocity in feet per second, and the velocity multiplied by the area in square feet will give the discharge in cubic feet per second, which result multiplied by 40 will give the discharge in miners' inches.

Example: To find the velocity and then the discharge in cubic feet per second, and miners' inches from a ditch with a fairly straight course, and constructed through good ground, having the following dimensions and fall, viz.: Section of ditch, 6×3 feet; fall or gradient, 8 feet to the mile; length of ditch, 15 miles.

We first proceed by working out R, which we are told is the sectional area of ditch in feet divided by the wetted perimeter in feet, and in this instance it is $\frac{6\times3}{6+3+3}=\frac{18}{12}=1.5$.

S, or sine inclination, will be found by dividing the fall by the length, or $\frac{8}{5280}=.001515$.

Since twice G (the acceleration of gravity) is 2×32 2, or 64 4, we have G, R, and S, and our formula stands as follows:

6 times the square root of 64.4×1.5×.001515, and the easiest method of calculation in this case is by logarithms, as follows:

	Log's.
2g=2×32.2 or 64.4	=1.8089
R=1.5	=0.1761
S=.001515	=7.1804
SQUARE ROOT=2 | 19 1654	
	9.5827
×6	0.7782
	10.3609=2.29

Answer 2.29 feet per second velocity, and this multiplied by the area, 18 square feet=discharge, or 41.22 cubic feet per second, or 41.22×40=1648.80 miner's inches.

The above formula is also correct for flumes with sawed boards, and battens over the joints inside the boxes, but instead of using 6 or 5 as a co-efficient the formula must read $8\sqrt{2grs}$ for velocity in feet per second, and $8\sqrt{2grs}$×area for discharge in cubic feet per second.

I might add here, that these last formulæ have been practically tested by several authorities, and especially by the Government engineers of New Zealand, to whom I believe belongs the credit of arriving at the exact co-efficients shown above.

As before mentioned, it is of great importance that a safe allowance should be made for loss due to leakage and evaporation, more especially when the line of ditch does not pick up any small creeks or springs on its course, and it is agreed by the best authorities that a suitable allowance may be calculated by the following formula:

$$M\times\frac{\text{Sectional area of ditch in feet}}{\text{Mean velocity in feet per second}\times5280}$$

Equals the loss in cubic feet per second per mile, where M is a co-efficient varying from 3 to 20, according to the climatic conditions of the country through which the ditch is constructed.

In New Zealand, on the west coast and, in fact, all through the middle island, good results have been obtained by using 3 for a multiplier, but again in the north island, where the climate more resembles this country and the loss due to evaporation is heavy, it is necessary to often use as high as 20 for M, in order to obtain satisfactory results.

Fourth—When, owing to weak banks it is necessary to build walls on the lower side of a ditch, the ground should be removed to obtain a solid foundation, and two walls—an outer and an inner—should be built up, with space enough between to allow a good puddle clay to be rammed in; such a wall, if properly constructed, will never give further trouble.

Fifth—All earth, trees, roots, etc., must be moved quite clear of the lower side of the ditch, with the exception of just sufficient to make a track. Unless all waste materials are moved to such a distance that they will not become a heavy drag on the lower side of the ditch, slides will be frequent and costly.

Sixth—At the entrance of tunnels, commencement of flumes, and at other points where the velocity of the water is considerably retarded, the effect of water changing its form at such places is an important point, and must never be neglected; in fact, all calculations referring to the flow of water in ditches, etc., the mean velocity must be determined as accurately as possible.

Before going further, many readers will appreciate the following simple method of arriving at the areas or cross-sections of the different forms of ditches, sluices and flumes, which may be calculated as follows, viz:

To find the area of a section of a flume or ditch with straight sides, multiply the width of bottom (in inches) by height of sides (in inches), the product will be the area in square inches, and this divided by 144 will give area in square feet.

Example: What is the area of a flume or ditch 28 inches wide and 18 inches deep? Answer: 28x18=504 sq. in., which, divided by 144, = 3½ sq. ft.

(To be Continued.)

Mining Summary.

CALIFORNIA.

Amador.

(Special Correspondence).—At Pine Grove the Dane mill is now running on rock from the Mitchell mine, half a mile away. The rock is low grade, but is being quarried out from the surface, and the ledge is wide.

The Reward mill is making a run on a good shoot of rock, and the outlook is encouraging.

The old Markiee mine, near Volcano, is soon to be reopened by a San Francisco company. This mine was worked down to a depth of 500 or 600 feet in the seventies, and ore to the value of about $1,000,000 extracted. It is believed that large masses of comparatively rich ore were left in the various levels, as too low grade to prove attractive at that time. A dump of some 10,000 tons is estimated to be worth $2 to $3 per ton, and can be milled at a cost not exceeding 75 cents per ton.

The Robinson or Treasure Hill mine, near Volcano, is being actively exploited under the superintendence of Mr. T. B. Dillon. It appears to be an immense deposit of gold-bearing porphyry, with innumerable quartz seams running through it in all directions. The outlook is very favorable for a long period of profitable milling.

Ledger: On the Mahoney the mill is again running, though the inflow of water is so great that the lower beds have not been reached yet.

H. L. Whitney, who is operating the Lighthouse mine, intends to erect a 5-stamp mill on the property.

The crosscut on the Alma has encountered the footwall ledge and drifting is progressing both north and south in good-looking ore.

Record: A new shaft has been started at the South Eureka mine to the east of the present one. It is expected to sink it about 600 feet.

The Argonaut mine has just crushed 100 tons of ore at the Zeile mill and it yielded at the rate of $12.50 per ton. The crushing made previous to this paid $9 per ton.

The directors of the Potazuba have decided to sink the main shaft deeper and open new levels, and the work is to begin at once.

Butte.

Register: J. R. Lightford & Co. of the Indian Spring mine will shortly have a 850-foot shaft bored. They are now in 2400 feet with their tunnel, and in order to work the gravel to better advantage they will have an 8-inch hole bored from the surface down to the tunnel. Then a pipe will be put in the shaft and 200 inches of water will be used to wash the gravel. The boring will have to be done through lava rock until within 8 or 10 feet of the tunnel. They expect it will take about three weeks to complete the boring and get the pipe in place.

Calaveras.

Chronicle: A rich strike was made last week in the Blood mine, which was worked years ago, but abandoned when the vein was lost.

The North Star mine at Mokelumne Hill is working a 10-stamp mill and twelve men.

Prospect: Stent men have the Brunner mine and are now pumping out the water. Some good rock has been found.

The shaft in the Tryon mine is now 200 feet deep. A drift was run in 26 feet of solid quartz without finding the opposite wall, showing that the lead is widening with depth. Drifting was discontinued and sinking resumed.

W. Garrard is sinking on the old Brown mine, below the new Stickle hoist. The shaft is now about 80 feet deep and good rock is being taken out.

The tunnel being run by Shepherd & Co. at Robinson's Ferry is now in the hill 1300 feet. The ore is low grade, but indications for better rock are favorable.

F. Baumhogger has resumed operations on the Great Western, between Altaville and Angels. Sinking in the shaft, which was already 100 feet deep, has been commenced. The vein is 10 feet in width; the ore has proved satisfactory.

El Dorado.

(Special Correspondence).—Summers and Miller of San Francisco are taking ore from the Gray Eagle, Mammoth and Myrtle properties and crushing at the Mammoth 10-stamp mill above the confluence of Weber creek and the American river. The ore is fair grade and rich in sulphurets.

A Chinese company bought a large tract of land, built impounding dams, and are hydraulicking, near Volcanoville. The property is known as the Flora mine.

The Two Channel Mining Co. on the Georgetown divide has completed a new tunnel 750 feet and tapped the lowest part of the channel. The tunnel is timbered with 7-foot posts, 3½-foot caps in the clear, and laid with T-rails. The 10-stamp mill will soon be running at one end of the property, while a hydraulic plant is in operation at the other. W. C. Green is the superintendent.

The Morris mine, an extension of the Two Channel, has extended the old tunnel and made an upraise 18 feet into the gravel. The tunnel is 600 feet long. This is a milling property.

L. P. Burnham of Oakland has bonded from Barrette Bros. and others the old Crystal mine for Eastern people. At 190 feet the shaft was abandoned nine years ago. There is a 10-stamp mill on the place. Work has been started to pump the shaft and also to run a tunnel. The property is two miles south of Shingle Springs.

The Star Light Co. are extending the 270-foot level from the south to the north shaft—a distance of 600 feet. They are taking out a very good grade of ore.

Eastern people are negotiating for a bond on the old Pocahontas property with a view to pumping the shaft and examining thoroughly this one-time rich property, on which the relics of three score of arrastras are plainly visible. The mine was worked by Spaniards in the 50s, and was taken up under bond about a year ago by a corporation, whose bond expired within the past month.

The Big Sandy Co., of Toledo, Ohio, whose works are located at Kelsey, are negotiating for the "old Jim Marshal property," latterly known as the Gray Eagle, the north extension of the Big Sandy.

The old Mount Pleasant near Grizzly Flats was transferred within the past few weeks to people who will soon renew operations on this old-time dividend-paying mine, which was abandoned at a depth of 700 feet about ten years ago.

On the 8th inst. the German quartz mine, situated nine miles south of Placerville, was sold by Hager and Straten to Chas. O. Richards of San Francisco for $12,000. The shaft is down 132 feet. There are two known ledges at this point about 40 feet apart, each said to be above 4 feet, of pay quartz in stratified slate. Work is to be actively inaugurated within a week. The ore is fair grade and rich in sulphurets. It is a mother lode property.

Raymond and Turner have reached 25 feet in shaft and 35 feet in tunnel on a 3½-foot ledge of $10 ore, about 4½ miles south of town.

The lumber output for the coming season in this county will be enormous as compared with other seasons, judging from the contracts made with properties under development. The contract price is $15 per M. delivered at the mine.

H. E. Casey is running a bedrock tunnel on the old Ames property, within a mile from Placerville. He has reached 800 feet and cut over 3 feet of pay gravel. He has just entered the channel and will soon be ready to erect a mill.

At the Griffith Consolidated a new tunnel has reached about 75 feet, with a prospect of 600 feet backs, cutting probably five ledges.

D. H. Jackson has a crew at work sinking on the Marguerite, a mother-lode property, near the old Superior mine, about three miles south of town.

Placerville, April 12, '97.

Placer Argus: E. M. Smith of Coloma has received returns from copper ore sent to England from the Lily Emma mine near Greenwood creek. The return shows 16 per cent copper, 8 ounces of silver and $3.25 worth of gold to the ton. The English syndicate that has been talking of purchasing will probably take the mine if the ore body proves to be large enough to justify them in purchasing.

Nevada.

Union: At the Home mine on the 320-foot level a strong body of ore has been encountered which is over 3 feet wide. The quartz is high grade. This is the same chute of ore which was cut about 90 feet above where the present strike was made.

Placer.

Sentinel: Supt. J. A. Shields of the Glen Consolidated gravel mine reports that the mine continues to pay well. Six men are now at work and the force will be increased this spring.

The Hidden Treasure Gravel Mining Company have ceased operations at the tunnel at Sunny South and will devote their entire attention to their works at the Dam tunnel at Centerville. The Hidden Treasure Company now have seventy-five miners at work breasting gravel at Centerville.

D. Harmon, formerly superintendent of the Mayflower mine, is now in charge of the California quartz mine near Graniteville, owned by the Shasta Mining Company. A bedrock, 2000-foot tunnel is running to tap the ledge below the old works. The tunnel is now in 1675 feet, 162 feet having been made during March. The vein is on the contact between slate and syenite, and workings near the surface developed a pay chute of nearly 1000 feet.

Argus: The Bullion mine, near Ophir, which has produced some excellent ore, but which has been idle for some time past, has been bonded and is now being worked by H. E. Ladd and J. C. Rude.

The Eclipse mine was started up on Wednesday last under the management and superintendency of Ben Hawkins. At present, while drifting is going on, only five stamps will be run, but it is expected they will start the other five stamps soon.

Work has been commenced on the shaft for the Golden Blossom Company. The shaft in the clear is about 7x15 feet and when timbered complete will accommodate three compartments of 4x4 feet each. The new hoisting works will be erected with a view of sinking from 1000 to 1500 feet.

Plumas.

Independent: A large amount of capital is to be expended by English capitalists on the group of quartz mines consisting of the Kettle, Caledonia, Baker, etc., consolidated as the Green Mountain. An estimate of the cost of driving a tunnel 2000 feet in length, which includes machinery, has been made and the determination reached to expend $100,000 on the enterprise. Three eight-hour shifts will be put on and the tunnel driven without intermission. This is the first time in the history of the Green Mountain that a thoroughly business-like proposition has been entertained in regard to its proper development.

National-Bulletin: At Granite Basin Mr. Pratt, a New York capitalist, has the Morning Star bonded and is prospecting by a shaft which is now down 90 feet. When to a depth of 100 feet, drifting will begin. On this property fifteen men are now employed, and later ten more will be added. J. E. Frick is the superintendent.

John R. Perkins has directed Horace Waldron to employ men and begin taking ore out of the Homestake mine.

San Bernardino.

(Special Correspondence). — Providence Mountain district is producing high-grade ore. The old Trojan district is evidently entering upon a prosperous era. It is a twenty-five-mile down-hill haul to Fenner, the nearest station on the Atlantic & Pacific Railroad. The cost from mine to car is $10 a ton. A great deal of the ore runs about $100 a ton; some as high as $400 or $500.

Notwithstanding the low price of silver, a number of shipments of ore have lately been made from the Ivanpah district, in the northeastern part of San Bernardino county.

Don Palmer of St. Louis and W. E. Van Slyke of San Bernardino are developing a group of mines—copper and gold—in the Sunrise mountains, eighteen miles southeast of Needles. They have a shaft down over 100 feet and have done considerable tunneling. Should the ore bodies hold as well as they now appear, a mill of at least forty stamps will be erected on the Colorado river, near the new Atlantic & Pacific bridge.

John and Rudolph Flynn are running an arrastra on picked ore at the Mountain Jewel mine, eighty miles north of Needles. Power is furnished by a gasoline engine.

There has been talk of erecting a smelter at Needles. A Denver expert named Davis, seconded by the business men of the desert town, has been investigating the mines adjacent to that point. It is said that, if his report is satisfactory, a plant with a capacity of at least 100 tons a day will result.

Everything seems to be going forward favorably in the Virginia Dale district. Miners at the Desert Queen are now taking out ore that averages 50 cents to the 100-pound sack. The forty-ton mill at the old Virginia Dale mine is running nearly all the time, and the owners express themselves as being satisfied with the returns. In the Pleasant Valley mine Prince & Christy have opened up an 11-inch ledge of rich ore. The county is building an excellent road from Amboy, on the Atlantic & Pacific, to Dale City. G.

San Diego.

Union: The bonding of a group of mines in San Mateo canyon owned by W. S. Clark, to an English company, has caused renewed interest in that section. The mines were bonded for $25,500, of which the first payment has been made, $5,000 being due April 1, and the balance due in three quarterly payments. The English company proposes to erect a smelter at once. The mining district is about twenty-five miles from Fallbrook, in the Santa Rosa mountains.

Shasta.

Searchlight: The London-Burton property of Centerville mining district will be started up shortly.

R. G. Hart has completed the tramway from the Central mine to the river. Twenty men will take out ore for shipment to the Keswick smelters.

Siskiyou.

News: Four days of good weather has enabled the Klamath Flume and Mining Company (the Big Four Company) to complete their second preliminary survey. They will adopt the second survey—the tunnel route—which will cut off eight miles of the distance.

Mr. Garrett, who purchased the bar just across the river from Hamburgh, has begun work on his claim. The mine will be worked by means of a large derrick and a good sized force of men will be employed.

A sawmill has been erected at the Aurora quartz mine in Cherry Creek district, which will provide the lumber for extensive buildings on the property. A 10-stamp mill will be put up, with a forty-horse power engine and a sixty-horse power boiler.

S. J. Fore, who is developing the Last Chance placer mine, near Callahans, turned water into the new ditch last week. The pipe has been laid and all machinery is in place ready to start the elevator.

Journal: Smith and Hunter have removed the machinery and pump about 160 feet southwest of the shaft lately sunk at the Greenhorn Blue Gravel mine, and are sinking a new shaft to strike the main channel.

S. J. Fore is getting machinery and lumber over to McAdams creek to put up a sawmill at Hi Yu gulch, where he has a quartz mine. As soon as the sawmill is in operation, he will put up a quartz mill.

Superintendent Brokaw of the Steamboat mine, on McAdams creek, near Fort Jones, is expected to start up work soon.

The Horse Creek Mining Company's claim on the Klamath river is being worked with a good supply of water in the ditch, to keep the giants constantly in operation.

Some fifteen Chinamen are working a claim on Klamath river, below the mouth of Horse creek.

The Distlehorst-Barton dredger is at work below Oak Bar. The dredger has handled an immense amount of gravel since it was built and has paid the owners fairly well. They expect some time to strike a rich bed of gravel, as there are certainly plenty of them in the Klamath.

The new shaft in the Greenhorn Blue Gravel mine is down about 70 feet, and in another week will be at bedrock and on the main channel. As soon as bedrock is reached, a larger force will be put on.

Reporter: The mine of Martin Shuler, below Scott river bridge, week before last produced about $350 for the labor of three men. In this amount there was one nugget weighing $114 and another worth $68, besides several smaller ones ranging from $5 to $30. The week before a nugget worth $180 was found.

The Columbia mine has a full crew at work and the ore taken out is very good. The mill is running steadily.

Capitalists are negotiating for the Gumboot mine, owned by Simon Bros. & Co.

Journal: The Seattle Placer Mining Company, at Nolton, are running full blast.

The Siskiyou Gold Mining Company, below Happy Camp, had a cleanup a few days ago, and sent $3000 in gold dust to Fort Jones for shipment.

The American Bar Company, on the Upper Klamath, commenced hoisting a few days ago, and find the gravel prospecting well.

The hydraulic mines along the Klamath are doing well. The new companies which have put in modern machinery and obtained a plentiful supply of water, are well satisfied with the expenditure of their capital.

At the extension of the Siskiyou mine, a ledge on the Hamburg, owned by Raynes, McCook & Farraher, some of the richest ore ever taken out in Siskiyou has been found.

Trinity.

Journal: There is a splendid field for prospectors in Trinity county in the Trinity Center and Coffee Creek districts, on Canyon creek and Stuart's Fork, East Fork, Rattlesnake, New river, Hay Fork, and Wildwood, and along the Lower Trinity. A large amount of capital is seeking gold investment in this State and nothing stimulates the prospector more than the fact that a promising location is readily salable at a fair compensation.

Hall & Carpenter will shortly put up a roller mill, equal to 4-stamp output, on their properties on the Trinity county side of the Harrison gulch lead.

Tuolumne.

Union-Democrat: At the Rawhide the shaft is down about 1070 feet, with 230 more to go before crosscutting. At present a force of miners is employed on the 900 and 1000 levels, drifting, stoping, etc., and all rock reduced in the 40-stamp mill is being taken from these points.

At the Dutch high-grade ore continues to be extracted from the workings of this mine, almost altogether from the 200 and 300 levels.

At the Rappahannock sinking is still going on below the 600, and the extra 30 feet for a sump has almost been attained. Immediately or reaching this depth crosscutting, drifting, stoping, etc., will be commenced with a large force of miners. The ledge shows very strong, carrying a wall to wall width of 35 feet.

At the Tarantula sinking continues night and day in shaft No. 4. The vein which by actual test went up into the hundreds per ton, is widening.

The Leap Year is driving in its tunnel for the big channel in Table mountain, but is also running out some first-class gravel as it goes along.

Development work on the Santa Margarita, Hog mountain, has been commenced.

The Philadelphia mine, on the North Fork of the Tuolumne is being developed under the supervision of W. H. McClintock.

A great many pocket miners have recently located on Bald mountain, recognized as one of the best districts in the world for that class of mining.

NEVADA.

Carson *News*: Rapid progress is being made on the cyanide plant at the old Eureka site, which is being constructed by McCone, Cain & Woodbury. This plant is being put up to work what tailings are left at that place, and will also work the Chollar tailings and the large batch that lie behind the old foundry just this side of Silver City. The plant is of 120 tons capacity per day. It will be ready to begin operations before the first of next month.

De Lamar *Lode*: Dwyer & Jacobson are getting good assays from a 15-inch streak in their claim, the Defender, between De Lamar and April Fool properties.

On April 1st the April Fool Gold Mining and Milling Company made a reduction of 50 cents a day on the miners' wages on their property.

Nearly all of the machinery for the new additions to the De Lamar mill is being put in place. Several new leaching tanks are now in operation, and when everything is completed over 300 tons a day will be worked.

Gold Creek *News*: The Gold Creek Mining Company have built fifteen miles of ditch during the winter and thrown up a dam and a dike that contain 62,000 cubic yards thrown up to make the reservoir. The length of the in-take ditch is 42,380 feet, outlet 33,800. There is a by-pass ditch to take the water from the in-take around the reservoir 2700 feet long, and two small ditches to bring the water in from Big Bend and Mill creeks, 325 and 400 feet respectively. The reservoir tower is 50 feet high. The dam itself is 44. This tower will eventually form a well of solid masonry.

Territorial Enterprise: Work is to be commenced on the Zadig tunnel, which was started some time ago for the purpose of draining various of the Silver City mines. John Kelly of Bodie has become interested in the proposition and will take an active part in the furtherance of the enterprise.

At Ely lumber for a mill for the Chainman mine, which was recently sold to C. D. Lane and others of California, is being hauled in, and the company will no doubt go ahead with the opening up and draining of the mine which has so long stood idle. Pumping machinery and pipe is being taken in.

The Egan mine at Egan canyon is making preparations for heavy machinery.

Many big outfits are waiting at Wells to go into the Contact district at the head of Salmon river, on the Idaho and Nevada line, sixty-five miles north of Wells.

OREGON.

Baker City *Democrat*: The owners of the Virginia Consolidated mine have decided to put in a station at the present depth of the shaft, 500 feet, and crosscut to the Virtue ledge; also to continue deep sinking 200 feet farther and then crosscut the same as above.

A cleanup of $10,000 was made last week at the Bonanza, the result of eighteen days' run with twenty stamps. Sixty tons of concentrates were saved during the run which will yield a net profit of upwards of $3000.

The Burnt River Mining Company own all of the numerous quartz claims on what has been known for some years as Gold hill. The

mines are located twenty-seven miles southeast of Baker City. There are a series of drifts on ore showing the existence of at least ten parallel veins. The ore in the veins runs from 20 inches to 4 feet. A crosscut tunnel has been started on the Spring Gulch mine, to cut all of the lodes at nearly right angle. This tunnel is already in over 300 feet, and when it is a little over 2000 feet in length it will be 1250 feet below the summit of the mountain.

Grants Pass *Observer*: Kramer & Wheeler have bought the Henry Hutchins mine on Pea Vine mountain, in the Galice Creek district, and will soon commence the erection of a quartz mill.

WASHINGTON.

Spokesman-Review: At Nelson the Reservation Mining and Milling Company are working a large force of men on their property near the boundary, and but for the present transportation facilities the property would be a shipper.

A Spokane company has recently stocked a group of claims in Vulcan camp and intend putting men to work at once.

At Boundary the general development work which the Bald Eagle Company has been carrying on during the past five months has satisfied them of the permanency of the ledges, and now they have laid the permanent tunnel for working the property.

BRITISH COLUMBIA.

Spokesman-Review: The shipments of ore from Rossland during the week ending April 3 were: Le Roi 851 tons, War Eagle 144, Iron Mask 96, a total of 1091 tons. There was shipped from the Trail smelter during the past week 142 tons of matte. The amount of ore milled by the O. K. Company was 123 tons. The total shipments from Rossland from January 1 to April 3 were 15,031 tons.

A number of big payments have been made on bonds on properties in the Trout Lake district. The Horne - Payne Syndicate paid $23,400 on the Broadview, Old Sonoma and Phillipsburg. The English company owning the Great Northern paid $10,000.

At Sandon during March there was shipped from the Ruth mine 690 tons of ore, from the Payne 1150 tons, and from the Slocan Star 360 tons. The Slocan Queen, adjoining the Slocan Star, has a showing of 14 inches of ore in the face of the 175-foot tunnel.

At Greenwood work will be shortly begun on the Anaconda group of claims, Deadwood camp. This group consists of the Anaconda, Kootenay and Columbia, and is owned by E. A. Bielenberg of Greenwood. They have an extensive surface showing of copper and iron pyrites.

At the Jewel, Long Lake camp, the shaft is down 120 feet, and the showing of ore has improved.

The work which has been carried on at the coal deposits at Rock creek for some time has resulted, it is reported, in the striking of another seam of coal of an excellent quality.

At Camp McKinley last week the Dongola group of five claims was bonded to T. H. Calland of Vancouver, who represents an English syndicate.

The Combination tunnel is well under way, and it is expected that work will be continued on this property all summer.

The Gold Bug and Hidden Treasure claims, in Deadwood camp, have been sold to Adolph Drucker, M. P., of Northampton, England.

The Lead King group of claims has been bonded, through W. T. Thompson of Midway, to an English company. The group lies about one mile south of Anaconda.

At a distance of 230 feet from the mouth of the tunnel the hanging wall was struck on the Mother Lode claim, Deadwood camp. The first 27 feet was in solid rock; the balance of the distance, or 203 feet, was all in ore, some of which was of a good grade.

ALASKA.

Mining Record: Again the warning is sent out from the Yukon to all to stay out of the country unless abundant supplies are taken. There will be work for a large number of men and wages will not be less than $10 a day, but all men hired will be required to board themselves, and it is more than likely that those who come with less than a year's supplies will be refused work. If a claim owner employs a man who comes without provisions he forces a division of his own scanty stock, and is thus cutting his own throat and insuring the doubling of his own privations. The companies cannot possibly carry in enough to supply those already there; any addition to the number to be provided for must bring starvation to all.

Concerning the big returns from single pans of dirt, it should be remembered that the dirt is invariably taken from bedrock, and in these immensely rich spots the pay streak is always thin, sometimes not more than 2 or 3 inches. On the other hand, an example is found in the Rhodes claim, where the gravel runs from $2.47 to the pan on the upper strata to $4.99 at bedrock, with a pay streak 9 feet deep. On such claims as this no barren dirt need be handled, and the net profits equal those where the richer, though very much smaller, pay streaks are found.

UTAH.

Mammoth *Record:* In the Home Rule Consolidated a 5-inch vein of ore, which assays forty ounces of silver and 30 per cent lead has been encountered in the drift which has been run for 80 feet from the bottom of the 160-foot shaft.

An expert has been out looking over the Boss Tweed, and it is probable that a sale of the property will be consummated in a short time.

The new hoisting apparatus for the Mammoth mine will be set in motion within a week. It is the intention of the company to increase the output of the mine, and to push the shaft down to the 2500-level as rapidly as possible. Nearly all the ore which is now being taken out comes from the upper levels.

Peyton & Bacorn have leased the Sioux mill and expect to start the machinery as soon as a supply of ore can be secured from the Sioux.

Tintic *Miner:* Manager Johnson of the Gold Point mine at Sunshine has secured a lease and bond on the Gold Blossom mine, northeast of Eureka.

Shipments from the district for the week are as follows: From the Bullion-Beck mine, twenty-five carloads ore; Bullion-Beck mill, five carloads concentrates; North Star, two carloads ore; Buckeye, one carload ore: Dragon iron mine, one carload ore daily: Noon's iron mine, one carload ore daily; South Swansea, five carloads ore; Swansea, five carloads ore; Mammoth mill, 7 carloads concentrates.

A new strike is reported on the 300 level of the Homestake.

A good strike of ore is reported this week in the Morning Glory. The ore is in the drift from the 265-foot level, about 65 feet from the shaft.

Mercur *Mercury*: In the Camp Floyd district 503 men are employed in the mines. The figures emphasize the remarkable amount of ore mined in this district per man employed. Take the Mercur mine, for instance: With only a hundred men employed, including shift bosses, engineers, miners, timbermen and muckers, an average of thirty tons are mined and placed in the ore bins, ready for loading onto the ore train every day.

The Wonder workings are being extended rapidly. The vein has been crosscut 50 feet, and drifted on 40 feet. The ore looks exceedingly well.

Salt Lake *Tribune*: At Silver City in the Homestake 50 feet from the 300-foot level a body of ore was broken into which shows a gray copper. This, said an officer in the company yesterday, demonstrates what has been contended for some time, that in the Homestake is to be found a class of ore as good as that which has made the mines on the north famous.

State Line district has almost instantaneously discarded her winter garments. The Ophir Company are working with a full force again, and a shipment of high-grade ore will shortly arrive on the market. Favorable reports come from all properties under development in the district, and several new strikes are reported from the surrounding country.

IDAHO.

Spokesman-Review: In the Pierre's Lake district a body of rich ore has been uncovered in the Anaconda mine. Three feet of solid ore was encountered in the bottom of the incline shaft at a depth of 15 feet.

There are a number of well-known claims in the Pierre's Lake district, among them the Little Giant, Lincoln group, Big Iron, Peerless, Butte and Chief group, and others. The owners of the Lincoln will put ten men to work on their claim as soon as the weather will permit.

At Wallace a strike has been made in the crosscut tunnel on the Panhandle. A stringer was being followed, and for some time it had been showing up considerable galena, but the ledge was cut in a fine chute of ore.

The Palmer Mountain Tunnel Company have ordered a five-drill compressor plant to hasten the work of the tunnel scheme. In addition to this a complete steam plant has been ordered to furnish power to the drills and for electric lighting. The plant will be in operation by June 1. The tunnel is now in 250 feet and at a distance of 150 feet farther they expect to intersect the vein on the Tunnel claim at a depth of 170 feet. The next vein to be intersected is the Final, 300 feet from the Tunnel vein. One hundred feet farther on is another vein, which traverses the Final on the surface.

De Lamar *Nugget*: A mining company has changed the channel of the Clearwater at Webfoot, ninety miles above Lewiston, and will work the channel of the river for placer gold. The water was turned through an old channel by means of a dam 225 feet long. In years past miners have made from $5 to $6 a day with a rocker, but the Indians drove the miners away.

At Gem the Formosa mill has been started. This will be the first new Cœur d'Alene mine to commence shipping this year.

Near Kendrick, on Big Bear creek, where copper ore was recently discovered, several claims will be developed this season.

At Mullan, Miles C. Moore will soon have a force of men at work on the Central, on the mountain side south of town. He is interested in gold properties near Pierce City, to which he took a quartz mill during the winter.

MONTANA.

Walter S. Kelly makes the following report for February to the English stockholders of the Elkhorn mine: Dry ore panned, 1196.33 tons; average assay value ounces, $35.32; average per cent salt used, 15.39; average tailings, ounces, $3.03; average per cent saved, 92.67; number Dore bars produced, 37; number ounces fine silver produced, 37,616.69; number ounces fine gold produced, 33,459; batteries in service, 21½ days; pans in service, 28 days. Shipments of smelting ore: Lot No. 3, 30.8075 tons; proceeds, $1918 69; Lot No. 4, 26.4770 tons; proceeds, $1872.19; total, 57.2845 tons; proceeds, $3790.88. Result of month's operations: Estimated value of bullion shipped, $24,076; surplus on January shipments, $790.91; net value of bullion, $24,866.91; returns from ore shipped, $3790.88; total receipts, $28,657.89; current expenses, $28,488.87; profit for February (or at $4.90 to £ sterling equal to £10.5), $5168.92.

Miner: At the Original mine sinking on the incline shaft is again in progress from the 900-foot level. When the 900 was reached a station was cut and now another 100 feet will be sunk before another station will be made. From the 1,000-foot level some crosscutting will probably be done and it is thought probable that the main vein running through the Gagnan will be found near that level.

Inter-Mountain: The deal for the sale of the Gold Hill mine is closed by which J. K. and C. W. Clark, E. L. Whitmore and A. J. Johnson become the owners for $100,000, cash payment of $2,500 having been made to bind the sale. The property is at Gay Lord. Work will be continued on the upper tunnel, and another tunnel 200 feet lower down will be run. This tunnel will give a depth of about 360 feet. Besides this claim the new owners have bonded 6 adjoining claims upon which little work has been done, but which may prove valuable later.

The sale of the Michael Davitt, a small fraction lying east of the Pennsylvania and south of the east line of the Rarus, to the Montana Ore Purchasing Co. for $351,100, was a surprise to the mining men of Butte, who had no idea that the property would bring that figure. It is very generally believed that the strip of ground is looked upon as a key to the lawsuit now on between the Boston companies and the Montana Ore Purchasing Co. The Michael Davitt is an L-shaped fraction, its greatest length being about 550 feet, and its greatest width about 400 feet.

SOUTH DAKOTA.

Black Hills *Times*: Negotiations are pending for the sale of the Keystone to an English syndicate. The Keystone is a big mine, but the ore is low grade, not to exceed $4 per ton, and cannot be made to pay the profits expected in mining with the present limited facilities for treating the ore. With a 100-stamp mill, equipped with modern automatic feeders, etc., it can be made a splendid proposition.

The Anna Creek Gold Mining and Milling Company has selected the site for its electrocyanide plant. All arrangements are ready for construction work to begin as soon as the snow goes off. Machinery has been ordered and will be on the ground in a few weeks. The new plant will have a capacity of 100 tons per day and will be completed by August 1st.

There are several very promising copper prospects situated in the vicinity of Custer peak, owned by the locators, W. M. Merritt and Wm. McMillan, upon which considerable work has been performed, exposing ore in large quantities on several different locations. A number of these copper lodes show great strength at the surface, containing carbonates and oxides of copper and iron in large quantities. The ores carry from 2 to 30 per cent copper.

The Golden Reward Company's plant is doing splendid work, running through 150 tons of ore on an average every twenty-four hours. At this rate the plant is treating 4500 tons a month, which yields at the rate of $25 a ton, $112,500 a month, or $1,350,000 a year.

WYOMING.

In the Jackson Hole district several strikes are reported every week, and as the snow is off these will be opened up and their true value determined. The granite formation contains fissure veins which carry free-milling gold ore.

Preparations are being made by the placer miners for spring work, which will be strung all along the river for forty miles. Near the lake, or head of Snake river, is the Harris Dunn Gold Mining Company's plant. This company has spent $30,000, last year worked seventy-five men, and will work a large force of men, next summer.

South of this outfit comes Miller & Bear, at the mouth of Buffalo creek.

Next on the Snake river is S. J. Brown, who spent all last summer and considerable money taking out a ditch and getting ready, which work was not completed until late in the fall. This portion of Snake river will be the scene of the most active work during the summer as it is here are located the Dead Man's bar placers, the Tortolalla Gold Dredging Company's placers, the Teton Gold Mining Company's placers, which will construct a ditch ten miles long, bringing water from the Gros Ventre river over to Snake river banks.

COLORADO.

Republican: All the early day prospectuses sent forth to unite interest in Cripple Creek companies laid heavy stress on the point that this was a dry camp. The Frenchmen who purchased the C. O. D. mine and formed the Rebecca Company to operate it had, no doubt, appreciated the advantages of mining without the hindrance of an underground flow of water. The flow that was struck has necessitated the erection of one of the largest pumping plants in Colorado, which will be in place shortly. Two of the great Battle Mountain mines, the Portland and Independence, will need such plants by the time the C. O. D. developments are completed and by that time again, there will be others. Cripple Creek is no longer a dry camp. If it is a camp at all, it is a deep mining and very wet camp. As a surface camp it could go on for ten or twenty years opening new surface chutes and scratching off the top, but for a long, enduring district, it must and will go deep and pump much water.

Blunt & Co., who are working the Fanny B., have produced $40,000 from their lease in the last four months. A drift run south from 135 feet depth has recently come into a new ore chute of fully as good grade as that worked in the 60-foot level. A pool of Cripple Creek merchants has recently taken the Bryan, on which Blunt & Co. have a bond, under a lease.

The California and Hidden Treasure mines, Nevada district, Gilpin county, owned and operated by the California Milling and Mining Company, Limited, of London, have been sold. The price and terms of sale have not yet been announced. The two properties together with the Hidden Treasure mill, were bought by the company some years ago, but have for a long time been worked at great disadvantage on account of the lack of sufficient capital, and have not yielded sufficiently to pay the interest on the mortgage of $40,000. The contract for the sale of the mines provides that the purchasers shall pay a royalty of 5 per cent on the whole output of the mines for a period of ten years, and that the ore produced shall be sent to the Hidden Treasure mill for treatment for five years.

During the month of March there were shipped from the Black Hawk depot of the U. P., D. & G. railroad, 302 ore cars aggregating 4,832 tons, which represented the mineral output of Gilpin county for the past month. As compared with the corresponding month of last year this shows a gain of 106 cars or 1,696 tons, an increase in tonnage of over 50 per cent.

The following table shows the increased ore shipment for the first quarter of this year as compared with the same period of 1896:

Months—	1896.	1897.	Increase.
January	191	335	144 cars or 2,304 tons
February	185	287	102 cars or 1,632 tons
March	196	302	106 cars or 1,696 tons

Cripple Creek *Mail*: Shipments from the Anchoria-Leland last week amounted to 154 tons. Of this amount, 54 tons had an average value of about $200 per ton, and 100 tons was low-grade stuff worth about $30 per ton.

It has been announced unofficially that the gross production from the Portland properties during the month of March amounted to from $60,000 to $70,000.

The Chicago & Cripple Creek tunnel has been driven into Globe hill 1810 feet. Two machines are constantly at work in the breast and making about 10 feet a day; a third machine is at work on the Lelia vein, discovered about 1300 feet from the mouth, and from which three cars of ore have been shipped, but not of a very high grade.

The Lillie, on Bull hill, has shipped 675 tons of ore for the month of March, which returned gross values of $23,385.95 and net values of $17,336.94. The average value of the ore mined was $34.60. The royalties received by the company amounted to $4213.91. There is still 147 tons of ore taken out in March to be heard from.

ARIZONA.

UNITED VERDE PROPERTIES.

(Special Correspondence).—The mines and reduction works of the United Verde Copper Company at Jerome are at present employing over 500 men and are handling approximately 400 tons of ore per day. The principal shaft is about 500 feet deep and from different levels tunnels have been driven, and the underground workings are extensive. The engine capacity of the plant amounts to 2000-horse power, which is utilized in hoisting ore, operating air drills, copper converters, machine shop and a 40-ton crane. A vast amount of new iron work is being put in, consisting of structural works for buildings covering the entire plant, consisting of engine and boiler rooms, converters, blast furnaces, machine shops and foundry. Additional engines and boilers and two new converters are being put in. A new reverberatory furnace has just been completed which will be used in smelting the finer ores, especially those rich in silver.

The ore when taken from the mines is first roasted in heaps, extending along the slope of the mountain in three long rows, whereby it is desulphurized. It then goes to the blast furnaces and finally to the converters. The copper bullion which is thus produced is about 99% pure copper.

The mines, smelting plant and town of Jerome are situated on the east slope of the Black Hills range, pretty well up toward the crest, at an altitude of about 5500 feet above sea level and at least 1800 feet above the Rio Verde valley, which spreads out in grand panorama to the east and south.

The town contains about 3000 people, and while a considerable amount of prospecting is going on in the adjacent territory, there is practically no mining in progress excepting that being carried on by the United Verde Company. The latter has a water system of some magnitude, the supply being derived from mountain springs.

The United Verde and Pacific railroad, which runs from Jerome Junction to Jerome, a distance of twenty-six miles, is an example of interesting engineering. Fourteen miles of the road—that portion which traverses the Black Hills range—contains 188 curves, 34 of which are of 40 degrees, 2 of 45 degrees and 132 from 36 to 40 degrees. In this distance of fourteen miles there are but two places where a train of five or six cars can straighten out.

WASCOTT.

Jerome, April 10th, '97.

Gleason, the new gold camp of southwestern Arizona, is experiencing a boom. Hundreds of men have already examined the properties of the district. The region, which is one of the most arid on the face of the globe, is now being worked over, acre by acre, scores of prospectors having been fitted out in Yuma during the past month. Among the old residents of Arizona there is little doubt that the new find is nothing less than the "Lost Frenchman" mine, one of the mineral legends of the southwest and one supposed to rest on a foundation insubstantial with the rest of the fabulous tales of Golconda found and lost.

The outfitting point for the new mines is Yuma, the only considerable settlement in the region. Transportation by stage is secured from a railroad station about thirty miles east of Yuma. It is believed that the ores will eventually be milled on the Colorado river, near Castle Dome landing, a distance of twenty-five miles. The springs relied upon to furnish water are far from sufficient for mining purposes. All this will, of course, demand capital. Till some such arrangement is made it is probable that the richest ore only will be sought, to be shipped elsewhere for reduction.

The main mine of the camp has been named King of Arizona. Parallel to it have been found several smaller ledges, running from a few inches to a few feet in width, and with assay values fully equal to those of the King. While development is naturally being first sought, the shafts have been sunk in every instance on good pay ground, and tons of ore are piled up under guard at the shaft mouths, awaiting transportation to the railroad.

Collapse of a Pair of Corrugated Furnaces.

Herewith is illustrated an accident which recently occurred on the Northwest coast, which shows the amount of deformation that a well-made corrugated furnace can undergo without leading to a disastrous explosion; also conveys the lesson that unnecessary complications in valves in piping should be carefully avoided, since they are almost sure to result in trouble.

The accident took place in one of the four compound marine boilers of the whaleback steamer City of Everett, used as a freight steamer in the coasting trade between San Diego, Cal., and British Columbia. The City of Everett was built of steel, in 1894, at Everett, Wash., and is 346 feet in length, 42 feet 8 inches breadth, and 13 feet 7 inches in depth. She has four compound marine boilers, each 132 inches in diameter and 11 feet long. The shells are of steel, 0.938 of an inch thick, and of 60,000 pounds tensile strength; and the pressure allowed by the Government inspector is 168 pounds per square inch.

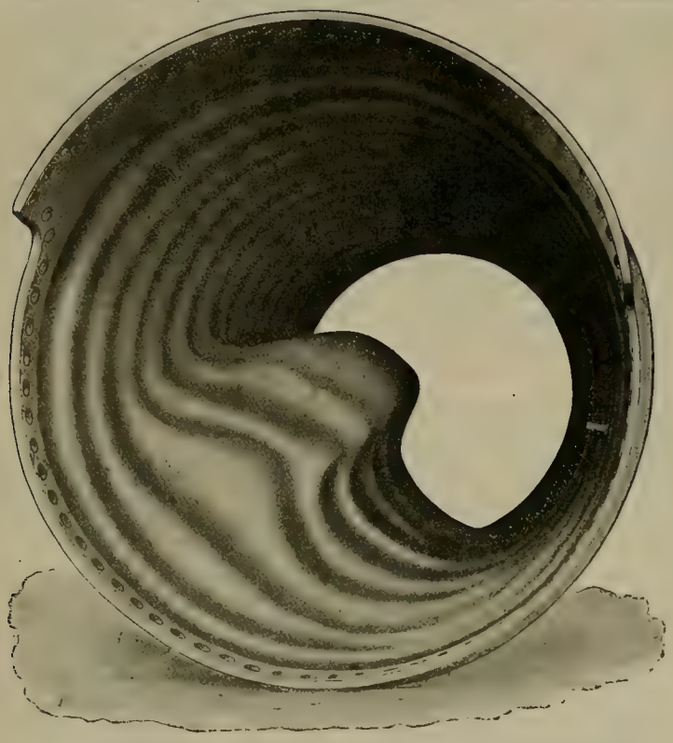

FIG. 1.—COLLAPSED FURNACE OF THE "CITY OF EVERETT."

Each of the four boilers has two corrugated steel furnaces 40 inches in diameter and 8 feet 6 inches long. The furnace, shown in Fig. 1, is from the forward starboard boiler, both furnaces of which were burned and bulged down by blowing the water out of the boiler while there was a fire in each of them.

The blow-off pipes from the four boilers are connected into cross or thwartship blow-pipes, which pass over the tops of the boilers, as shown in Fig. 2, and are provided with valves on the port and starboard sides of the vessel. It is this arrangement of the blow-pipes which led to the accident under discussion.

The vessel was loaded in British Columbia with coal, and after leaving Victoria, B. C., and while steaming across the straits of San Juan de Fuca, the engineer in charge ordered the water tender, or fireman, to blow down three or four inches of water from the starboard boiler. In carrying out this order the fireman opened the valve on the front head of the starboard boiler, and also the outboard blowing valve on the starboard side. (This will be understood by reference to Fig. 2.) After blowing down as far as desired the top outboard valve was closed. This, of course, stopped the blowing at once; but when the man came down from the ladder he forgot to shut the lower valve on the head of the boiler.

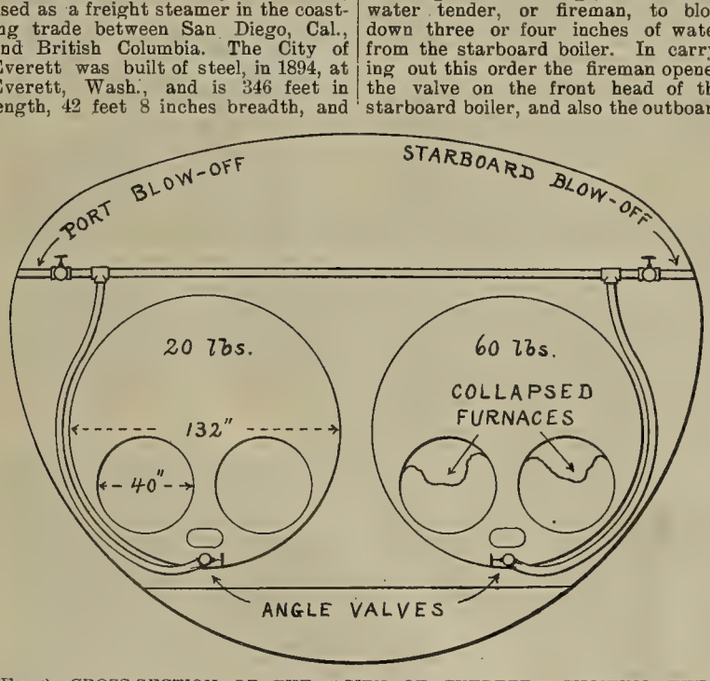

FIG. 2.—CROSS-SECTION OF THE "CITY OF EVERETT," SHOWING THE BLOW-OFF PIPES.

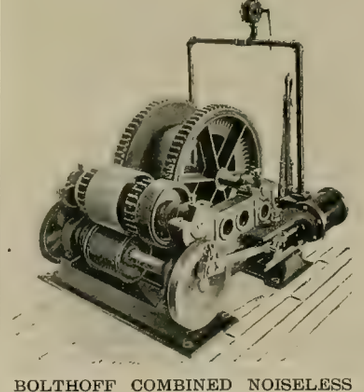


When the steamer reached Port Townsend one of the breeching bolts on the forward port boiler was found to be leaking, and the chief engineer therefore ordered the pressure to be lowered on that boiler, and that water blown out so that the bolt could be renewed. He also gave orders to wash out the two after boilers, and carry steam only on the forward starboard boiler (*i. e.*, the one on the right, in Fig. 2). Asthe Everett was to lie at the dock over night a slow fire was kept under this boiler, the fires under the other three being hauled. When the steam pressure on the three cooling boilers had been reduced to about 20 pounds orders were given to open the blow-off valves attached to them and blow down. This was done, the blow-off valve on the front head of the starboard boiler being open all this time, although it was supposed to be shut.

The result hardly needs to be told. The boilers from which the fires had been drawn were under only 20 pounds of steam, while the forward starboard boiler, with a fire in each furnace, was carrying 60 pounds, so that it emptied itself much more rapidly than any of the others. After some little time one of the firemen opened one of the doors of the forward starboard boiler, and found the furnace redhot and bulged down, as shown in the engravings. Upon investigation he found the other furnace in this boiler in the same condition. The fires were at once hauled out, and upon examination it was found that the furnaces were down 21 inches, the corrugations being pulled out so that at the bottom of the bulges the furnace was almost smooth; but no sign of fracture could be discovered.

If these furnaces had been poorly made, or if they had been constructed of a material deficient in ductility, it is almost certain that a disastrous explosion would have followed the rough usage to which they were subjected; and this fact ought to satisfy anyone of the paramount importance in boiler construction of having good material and good workmanship. The unwisdom of giving a fireman too many things to remember will also be apparent; for if the boiler had been provided with its own separate blow-pipe, discharging directly into the sea without any connection with the other boilers, this accident could not have happened.

Bolthoff Combined Noiseless Gear and Friction Hoist.

The new hoist herewith illustrated is made by the Hendrie & Bolthoff M'f'g Co., Denver, Colo., who say: "It is an acknowledged fact that the only serious objection to the older pattern of geared hoists is the noise caused by gears or pinions when attempting to operate at high speeds." They claim that by the introduction of their new patent noiseless gear and pinion they have reduced this to a minimum, and, combined with their friction hoist, have produced a machine which effects a saving of 33 per cent in steam and a consequent reduction in the fuel bill, safety to employes insured by a greatly improved brake, a durable machine. By the method of construction employed in this hoist it is impossible to spring the drum shaft. Standard sizes are as follows: 6x8, 7x10, 9x10, 10x12 and 12x12.

BOLTHOFF COMBINED NOISELESS GEAR AND FRICTION HOIST.

All their hoists are equipped with a Bolthoff balanced register throttle valve, by which the steam can be shut off instantly if occasion requires. The valve is perfectly balanced, and is provided with a screw to take up the wear. No packing is required.

Scientific Progress.

Proposed Polar Exploration.

Three incidents in Polar exploration of much more than ordinary significance have occurred within the last few days, says the Brooklyn *Eagle*. The public and formal indorsement by the American Geographical Society of Civil Engineer Peary's plan for an expedition to reach the North Pole, marks an advance in the development of the project and brings it within the reach of actualities. With the approval of this most authoritative and influential body of scientists and geographers, Mr. Peary's project has the recognized standing, which is essential as a base of operations, and upon which the efforts for the ways and means may be organized. The value of the moral support of the society is indeed greater than the financial, and, with this secured to the project, the systematic and vigorous effort among the individual members of the society will be likely to advance to definite form and purpose the project which promises so much to science and to America.

Scarcely less important is the report that the English Government, upon the recommendation of Mr. Goschen, first lord of the admiralty, is in favor of appropriating to the Antarctic expedition $80,000, which not only commits the English Government to a serious and persistent effort in the unknown and unexplored continental areas to the south, but, in the judgment of the London papers, indicates a conviction on the part of the Cabinet that peace for at least three years is certain. Dr. John Murray, upon whose recommendation Mr. Goschen has acted, asked for two ships for three years, with a maximum complement of 300 officers and men. Dr. Murray says that the expedition will spend the first summer in sounding the whole Antarctic ocean south of latitude 60, by which definite knowledge of the contour lines of the ocean's bottom may be obtained, and that a landing party, which would probably travel in a short time over the inland ice to the South Pole, should be put ashore. Whether there is any foundation for the report that Nansen, the Norwegian, is to head the expedition, is not known.

The third incident of interest in the Polar field is the grant by King Oscar, of Norway and Sweden, of a gunboat to convey Andree's balloon equipment to his Spitzbergen headquarters, and his request to the authorities of all northern and sub-Arctic posts and stations to inform the natives that the balloon and the explorers may be expected to drop among them at any time after July 1. A similar notification was sent out last year, but, as will be remembered, no one was seriously alarmed by the appearance or the arrival of the aerial party.

DISCUSSING, several years ago, the economic element in technical education, Prof. L. S. Randolph remarked that no more exasperating thing can occur to the young graduate leaving college, with his brain filled with thermodynamics, neutral axes, radii of gyration and the like, than to be asked the price of a six-penny pulley and to have no idea of the answer, nor to know where to get the information. The condition which prompted this statement is as much in evidence today as it was at that time. Business training is sadly neglected in the preparation of the engineering student for practical work in later days, and he should make good use, therefore, of any available opportunity afterward to acquire his training, partially at least, by actual contact with business methods. Engineering success to-day demands business faculties at ready command.

Electrical Progress.

Experimental Railroad Work.

The trend taken by the electric railway industry in the direction of the field hitherto occupied exclusively by the steam locomotive, as evinced by the recent developments on the New York, New Haven & Hartford and Baltimore & Ohio railroads, has caused the General Electric Company to provide itself with its own special line of track, upon which to carry out electrical traction experiments. Beginning with the early motors of Vandepoele and Sprague, and following along the lines of those built for interurban service, elevated, suburban and branch steam lines, and reaching the huge 360 H. P. motors giving a drawbar pull of 60,000 pounds on the great electric engines on the Baltimore & Ohio Railway, the next step is the development, along lines already indicated, of some feasible method of electric traction which can be adapted to long distance railroads, efficiently and economically, and, therefore, commercially.

FIG. 1.—MOTOR CAR WITH FOUR LOADED FREIGHT CARS.

The line of track built by the General Electric Company lies between the works at Schenectady, N. Y., and the Erie canal. It is 6700 feet long, of the regulation railroad construction, the service rails being standard rails 85 pounds to the yard.

The track rises on a gradient of 4 per cent to the level of the heel path. The first section of the line is a tangent 2415 feet long, the second a series of short tangents and curves 1635 feet long, and the third another tangent 2730 feet in length. Running beside the track on the far side from the canal are conductor rails. Of these there are two running, parallel with each other and the track, from the top of the first gradient to the end of the line. They are 30-pound rails, set on 8-inch ash blocks treated with bergtheer in vacuum pans and thoroughly impregnated. The two sets of conductor rails have been laid down for the purpose of experiment with alternating multiphase currents. For direct current experiments two rails are connected in multiple. Both service and conductor rails are bonded with 0000 copper bonds. The current is taken from the works power house over a line issuing from the back of the testing department. The feeder is a 500,000 c. m. insulated cable, running by the track for a distance of about 5300 feet. The line is divided into three working sections, each controlled by its own switch and semaphore. When this switch is closed its section of conductor is made alive, and the movement of the switch handle sets the semaphore. The experiments made so far have been carried on for the purpose of developing motors and systems of operation for elevated and surface seam roads. For locomotive a special eight-wheeled car is used. This resembles a regular passenger coach so constructed as to give an unobstructed access to the two motor trucks. The weight of this coach-locomotive, equipped, is 30 tons, empty. It is divided into three sections—a driving and testing department in front, a passenger division in the center, and a rear compartment in which are carried the air pump, tools, etc.

FIG. 2.—MOTOR CAR WITH FOUR N. Y. C. & H. R. PASSENGER COACHES WITH TROLLEY USED FOR MOVING THE CARS AROUND THE YARDS WHERE THE THIRD RAIL IS NOT LAID.

FIG. 3.—VIEW OF TRACK SHOWING THIRD RAILS.

The equipment of the forward compartment consists of a skeleton wooden switchboard carrying the ammeters, voltmeters, wattmeters, etc., to enable the engineer to gauge exactly and record the performance of the specific motor equipment which may be under experiment at any stated time. In addition the switchboard is fitted with the necessary quick break switches, magnetic blow-out, fuse boxes, automatic circuit breakers, etc. The controller is set in front of the right forward front window, through which the driving engineer has an unobstructed view of the track in front of him. To his right is the valve handle of the air brake, and in front of him is an operating ammeter gauging the current output. The resistances are suspended from beneath the central compartment.

In the test during which the photographs from which our illustrations were made the equipment of the car consisted of four General Electric 2000 motors—each motor being rated at about 125 H. P.—one motor to each axle, motion being communicated to the wheels through steel gear and pinion. The forward truck was equipped with a special speed recorder. The controller used was a K 16 series parallel controller.

From beneath the bolster of each truck, set between the wheels on the conductor rails' side, projects a heavy oaken beam, to which is suspended the contact shoe by means of which the current is brought from rails to motors. This shoe is a flat piece of cast iron, with the ends slightly curved. It is fastened by two loose links to an iron casting bolted to the oak beam. This method of suspension keeps the shoe continuously in contact with the surface of the conductor rail, as it allows it to conform immediately to any inequalities which may occur in the latter.

The air for the brakes and whistle, one of which is set at each end of the car, is furnished by a vertical direct connected air pump, operated by a motor controlled automatically. This automatic action is brought about by the balancing of the pressure in the tanks against the power of a spiral spring. The spring is coiled in a cylinder furnished with a piston, the upper end of which is a switch in a magnetic blow-out device. As soon as the pressure in the main tank falls below the desired pounds per square inch the spring forces up the piston until its upper end is in contact at the switch. Contact being made, the motor circuit is closed and the air pump motor starts. As soon as the pressure rises to normal the piston is forced back, the circuit is broken and the motor stops any arc at the point of rupture of contact, being immediately extinguished in the magnetic field of the blow-out device.

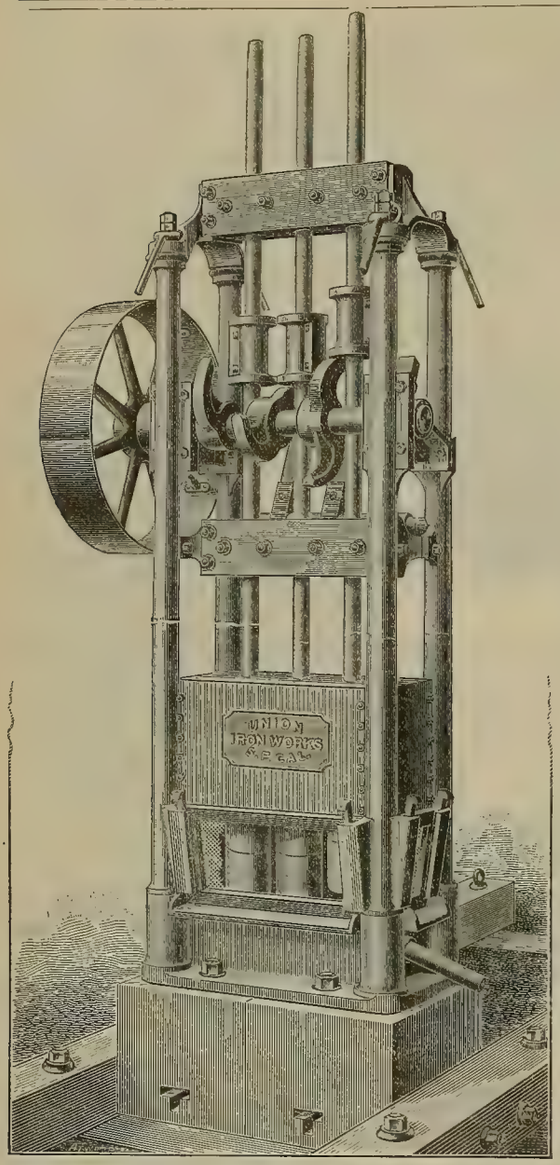
The first test made with the motor equipment, the total drawbar pull of which is about 15,000 pounds, consisted in the hauling of four flat cars, each loaded with pigs of iron. This load, about 121 tons dead weight, was easily handled by the locomotive, and the records as to speed and power required showed gratifying results.

The locomotive was then coupled to four standard passenger coaches, making, with the motor car, a train of 130 tons. The controller was in charge of Chief Engineer W. B. Potter, and S. H. Libby acted as conductor. Several interesting runs were made with this train up and down the track, with equally encouraging results.

Our illustration (Fig. 2) of the latter test is made from a snap shot photograph taken as the train was rushing past the first semaphore at a speed of about forty miles an hour. Fig. 3, made with the train at rest, shows the construction of the track, the method of laying the conductor rails and the semaphore with its switchbox.

Mechanical Progress.

H. P. of a Steam Boiler.



Rule: To find the H. P. generated in any kind of a boiler when running, first, notice how long it will take to evaporate 1″ of water in the glass gauge, divide this into 60, which gives number of inches evaporated in one hour; second, multiply the average diameter where evaporation took place by the length of the boiler in inches; this multiplied by the number of inches evaporated and the answer divided by .1728 gives the cubic feet of water evaporated in one hour.

There is no such thing as a H. P. to a steam boiler—it is a measure applicable only to dynamic effect; but as boilers are necessary to drive steam engines the same measure applied to steam engines is now universally applied to the boiler.

The standard as fixed is one cubic foot of water evaporated per hour from and at 212 degrees. For such H. P. this at that time was the requirement of the best engine in use. At the Centennial Exposition, in 1876, a board of engineers selected from all parts of the world adopted as a standard for tests of boilers 30 pounds of water evaporated per hour under a steam pressure of 70 pounds per square inch as representing one boiler H. P. The general rule in estimating H. P. of boilers is based on its evaporating one cubic foot of water per H. P. per hour one foot, or 62½ pounds, or $\frac{5}{8}$ gallons of water evaporated per hour is equivalent to one H. P.; that is, a boiler that will evaporate ten cubic feet of water, 625 pounds of water, or 62½ gallons of water per hour is a boiler of 10 H. P.

It is claimed that cast iron may be used for dressing or finishing wrought iron, cast iron or brass. It is said that an Eastern shop is using cast iron lathes for this purpose. It is a fact, however, that cast iron can to a certain extent be tempered by chilling. Being thus made harder, it bears the same relation to cast iron, which is comparatively soft, that one grade of steel does to another. It has been found that tools cast of a chilling mixture, with that part of the tool which performs the work chilled, will work better than the same tools made of steel—at least, the shop making a practice of employing them finds that the workmen prefer them, which in itself is a recommendation that would not be given without being backed up with reason. As many of our foundries are operated in connection with machine shops, it would take but a small outlay to test the claims of the efficiency of cast iron for this purpose.

An arrangement of fast and loose pulleys that is being used with some favor consists in cutting a number of grooves obliquely on the surface of the fast pulley, about 3 inches in length, running from that side nearest the loose pulley and terminating about the middle by a gradual diminution in the depth and width of the cuts. These grooves, which are cut about 1½ inches apart and in the direction in which the belt runs, have the effect of taking hold of the belt immediately it leaves the loose pulley, and, in wormlike fashion, draw it onto the whole surface of the fast pulley, thus relieving the belts at once from the pressure of the guide fork, and causing the pulley to be immediately gripped and started without delay. Where there is much belt shipping to do, as on mules, planers, etc., there is claimed an increased output of about 5 per cent and a saving in wear of belts.

MACHINERY.

AMALGAMATING MACHINES.

CASTINGS AND FORGINGS

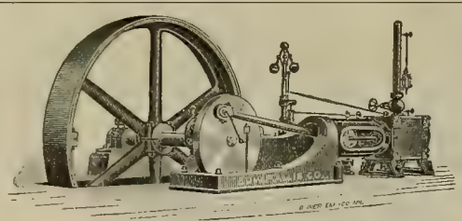
OF EVERY DESCRIPTION.

All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.



FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

Coast Industrial Notes.

—Work on the Sierra Railway from Oakdale to Sonora, Tuolumne Co., Cal., is progressing rapidly. Over two miles of track has been laid.

—At Los Angeles, Cal., the question of refunding the bonded indebtedness of the city, amounting to $270,600, was settled last Saturday by a vote in favor of the proposition.

—The preliminary survey for a narrow-gauge railroad from Ukiah, Cal., to the head of the Navarro river has been completed. The road is to be built by local capital, and will penetrate the redwood belt on the coast. It will be about twenty-five miles long.

—Minister Baker, representing the United States at Managua, Nicaragua, has been instructed by the State Department to take such steps as may seem advisable to prevent the forfeiture of the Nicaraguan canal concession by the Government to which he is accredited.

—There are planted for the Chino sugar factory at Chino, Cal., about 4000 acres of beets, of which 1200 are on the Chino ranch, 2000 acres about Anaheim and 170 acres in Ventura county. Anaheim has 1500 acres yet to plant, making a total of 4100 acres to be devoted to the crop there.

—A new fish hatchery, for which the supervisors of Mendocino county contributed $750, has been completed at Ukiah. Eggs will be received at the new hatchery from Lake Tahoe April 15th. The product from the local hatchery will be used for stocking streams in Mendocino, Sonoma and Marin counties.

—The first steamer bound for Mexico under the terms of the agreement made with the Pacific Coast Steamship Company will leave San Francisco April 25th and touch at San Pedro for her cargo April 27th. The steamer will touch at San Pedro both going and returning, thus opening free trade relations between southern California and Mexico.

—The orange season for southern California is about closed. Thus far 4700 carloads of oranges have gone to market, and it is believed there are about 250 more carloads of navel oranges and 500 cars of other varieties. The crop was variously estimated last December from 7000 to 8000 carloads, so it will be seen that the estimates were from 500 to 1000 carloads too high.

—The Nevada County Narrow Gauge Railroad, Grass Valley, Cal., during the past year, earned $25,341.35 in excess of its expenses, paid $10,000 of its bonded indebtedness, and proposes to reduce the fare about July 1st. J. F. Kidder is president and manager; P. Johnston, vice-president; G. Fletcher, secretary and auditor; E. H. Brown, treasurer and superintendent.

—The Shasta Lumber Company was sold under foreclosure of mortgage at San Jose, Cal., last week, for $87,000. The property in Shasta county includes 35,000 acres of fine timber land in the Sierra, a thirty-mile flume that cost $150,000, twenty-two miles of railroad connecting with the Southern Pacific, sawmills, etc. It was mortgaged for $360,000, and was locally estimated to be worth a million dollars.

—The celery harvest in the peat lands west of Santa Ana, Cal., is concluded. There have been 250 carloads, or ten trainloads of twenty-five cars each. The celery is conservatively valued at $1500 per car, which would make the total output sent East represent $375,000. This amount of money represents only what was shipped East. The growing of celery for the winter markets of the East was begun only four years ago.

—In San Diego county, Cal., the Lower Otay dam will soon be completed. It is the first to be completed of four large rock-filled dams in process of construction by the Southern California Water Company. All are within sixty miles of San Diego and the system when completed will have cost $3,000,000 and will be capable of irrigating 100,000 acres of mesa lands in the county. One hundred and fifty men are now employed.

Recent California Mining Incorporations.

Jenny Lind Mining Company, San Francisco; capital stock, $1,000,000, all subscribed; C. D. and T. T. Lane, Angels Camp; L. W. Shinn, San Francisco; A. Hayward, H. G. Stevenson, San Mateo.

Karma Mining Co., San Francisco; Jno. M. Wright, D. E. Hayes, R. H. Turner, W. E. Thompson, J. W. Lancaster; capital stock $100,000, $50 subscribed.

Big Ledge Mining Co., San Bernardino, Cal.; M. Peacock, W. and S. Thies, Los Angeles, C. B. Morris, San Bernardino; capital stock $100,000, $21,040 subscribed.

Recently Declared Mining Dividends.

Gwin mine, Calaveras Co., Cal., $6000, payable immediately.

Portland Mining Company, Cripple Creek, Colo., $30,000; payable April 15th.

WANTED.

Position as Prospector or Mining Engineer for New Mining Company.

First-class assayer, millman, miner and cyanider. Eighteen years' experience in coast mines. Bonds furnished if desired. Address L, Mining and Scientific Press Office.

An Experienced Millman desires position in a mill. Has had several years' experience in different parts of California. Understands concentrators. Good reference given if required. Address "Millman," Mining and Scientific Press.

Personal.

HON. E. C. VOORHIES of Amador is a candidate for the San Francisco superintendency of the Mint.

WILLIS KNAPP has been elected superintendent of the Orient Mining Company at Tintic, Utah.

ALEXANDER BURRELL has been appointed manager of the Montana Mining Company (the Drum Lummond).

J. H. MEANS of the State Mining Bureau is making an extended study of the geological formation of Randsburg, Kern Co., Cal.

EDWARD KENT, who was for four years chief engineer for the Anaconda Company at Butte, Montana, has taken the same position with the Boston & Montana Company.

MARK ELLIOTT, a Santa Rosa, Cal., mining engineer, recently reported dead in Mashonaland, South Africa, has returned from that region after a five years' absence. He proposes to return next October.

ALEXANDER HILL, manager of the Mountain Copper Company, Limited, of Shasta county, Cal., has resigned and will take hold of some large enterprises in the same county on account of himself and some Eastern associates.

WILLIAM BAILEY, president, and O. P. Posey, general manager, of the Tomboy mine at Telluride, Colorado, were in San Francisco last week, where they made the formal transfer of 51 per cent of the stock and control of that property to representatives of the Exploration Company of London, which has purchased it.

CAPT. C. E. GILLETTE of the U. S. Debris Commission has returned from the southern part of the State, and, in company with Col. C. R. Suter and Lieut. C. E. L. B. Davis—the two other members of the commission—has been the past week viewing De Guerre point, Smartville and other points on the Yuba, Feather and Sacramento rivers, where restraining barriers are deemed feasible. The appropriation is now available, and as soon as the commissioners shall decide where construction shall begin, actual operations will commence.

PROF. LEWIS SWIFT of Echo Mountain Observatory, Los Angeles county, California, has received from the Royal Astronomical Society of England the Jackson-Gwilt gift, which consists of an interest in the invested capital and a bronze medal. This is the first time the Jackson-Gwilt gift has been awarded. The Herschel medal, which accompanies the letter, is of bronze, bearing on one side the inscription: "William Herschel, MDCCXXXVIII-MDCCCXXII," surrounding a bas-relief of the great astronomer. On the reverse side is a graceful female figure supporting a globe and surrounded by the planetary system, with the inscription: "Royal Astronomical Society, Jackson-Gwilt Gift." On the rim of the medal is inscribed: "Lewis Swift, 1897." Prof. Swift has discovered nearly 1000 nebulæ and comets. Nine medals and two cash prizes have been awarded to him for his discoveries.

British Columbia.

W. J. R. COWELL, B.A., F.G.S., Mining Engineer, Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

IF YOU HAVE A SMELTER--YOU WANT IT.
IF YOU HAVE A COPPER MINE--YOU NEED IT.
IF YOU HAVE A CYANIDE PLANT--YOU OUGHT TO HAVE IT.
IF YOU OWN CHLORINATION WORKS--YOU SHOULD BUY IT.
IF YOU ARE INTERESTED IN A MINE OR MILL--YOU CAN'T DO WITHOUT IT.

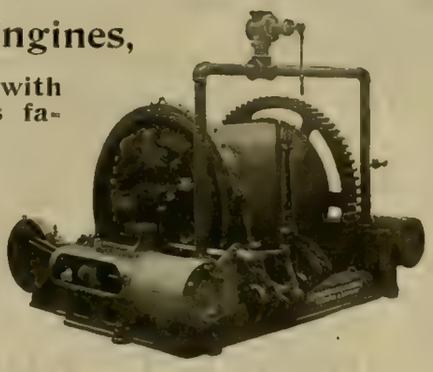
What? P. & B. Paint.

IT IS ABSOLUTELY ACID PROOF---TRIED AND PROVEN.

Manufactured by
PARAFFINE PAINT CO., San Francisco. Los Angeles.
You Can Order It From Your Dealer.

Hydraulic and River Miners!
YOU CAN REMOVE BOULDERS, STUMPS, SNAGS, ETC.,
WITH ECONOMY, EASE AND SATISFACTION BY USING THE
Knox Patent Hydraulic Grapple.
Address WILLIAM KNOX, Jacksonville, Oregon, or JAMES ARMSTRONG, 10 Front St., S. F., for information and prices.

WEBER Gasoline Engine For use in any place or for any purpose requiring power. Only a few minutes' attention required each day. Guaranteed cost of operation is 1 cent per horse power per hour. The simplest, most economical and best power. Address WEBER GAS & GASOLINE ENGINE CO., 430 Southwest Boulevard, Kansas City, Mo.



FRASER & CHALMERS,

Chicago, Illinois,

Have brought out a new line of medium size

Steam Hoisting Engines,

These are designed with great care by engineers familiar with the best previous practice, and knowing just what is wanted to render satisfactory service on a mine. Do you want such service? Then buy one of these improved machines.

Other Special Lines of Manufacture

On which we would be glad to quote are

Stamp Mills, Shoes,
Smelting Furnaces, Dies,
Cyanide Plant, Cams,
Ore Crushers, Rolls,
Frue Vanner Concentrators, Jigs,
Brown Roasting Furnaces,
Huntington Mills,
Perforated Metals and Screens,
Corliss Engines,
Adams Boilers,
Riedler Air Compressors & Pumps,
Otto Aerial Tramways.

Qualified by a Quarter Century of Experience to render you the best of service, we invite your inquiries and patronage.

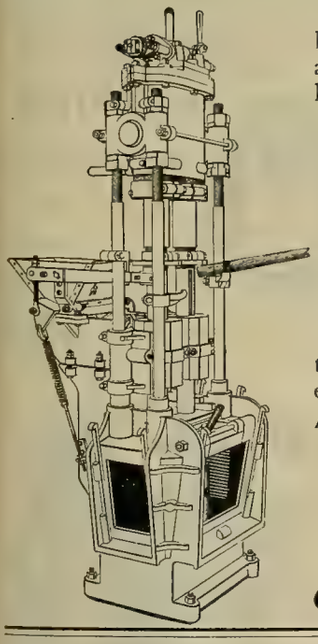
THE PELTON WATER WHEEL,

EMBRACING IN ITS VARIATIONS OF CONSTRUCTION AND APPLICATION

THE PELTON SYSTEM OF POWER.

In simplicity of construction, absence of wearing parts, high efficiency and facility of adaptation to varying conditions of service, the **PELTON** meets more fully all requirements than any other wheel on the market. Propositions given for the development of water powers based upon direct application, or

ELECTRIC TRANSMISSION



Under any head and any requirement as to capacity.

CORRESPONDENCE INVITED. CATALOGUE FURNISHED UPON APPLICATION. ADDRESS

PELTON WATER WHEEL CO.,

121 and 123 Main Street, - - - - - San Francisco, Cal.

A STEAM ORE STAMP.

One of the BONANZA MINES of the Black Hills was developed by a **TREMAIN STEAM STAMP MILL**, installed last summer at a cost of about $1600. After six months' run the superintendent wrote the following letter:

HILL CITY, S. D., Feb. 2, 1897.

Gates Iron Works, 650 Elston Ave., Chicago, Ill.—GENTLEMEN: It gives me great pleasure in informing you of our success with the Tremain Steam Stamp Mill which we have been running since last July. We have been running on hard, white quartz, some of it of a flinty character and a small portion of it slightly decomposed We average about ten tons every 24 hours through a forty-mesh screen. If our financial standing had been a little better, so we could have put in a small engine and rock crusher, I am confident we could put through 14 to 15 tons in 24 hours. The wear and tear is considerably less than an ordinary stamp mill, it all being on the shoes and dies. The last we used of these were of the aluminum steel, which are the best wearing shoes and dies I have ever seen. The parts are all well made and durable, I having failed to see any weak point about the machinery.

We use one cord of pine wood in 24 hours, and run the mill with 70 to 80 lbs. of steam.

I have followed mining in connection with milling for thirty years and have never seen its equal for convenience, durability and cheapness. To parties wishing to purchase a quartz mill I cheerfully recommend the Tremain Steam Stamp Mill for its small cost, economy in operation and complete results of working. Very truly yours, [SIGNED] JAMES C. McDONALD,
Supt. St. Elmo M. & M. Co.

This Mill has the capacity of a 5-stamp gravity mill and costs less than half to install. Automatic feeder of approved design. Weight of entire Mill 3300 lbs. Made sectional for mule-back transportation.

DEWEY & CO., Patent Solicitors.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will give inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S. F.**

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado, send to

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 6, 1897.

580,077.—PHOTO PLATE HOLDER—M. Anderson, Northport, Wash.
580,262.—STAIRWAY AND FIRE ESCAPE—G. H. Dyer, S. F.
580,269.—DREDGING APPARATUS—P. J. Gildea, S.F.
580,271.—BICYCLE BRAKE—A. N. Godfrey, Port Townsend, Wash
580,084.—WATER PIPE JOINT—H. H. Gorter, S. F.
580,282.—TOUCH REGULATOR—R. F. Hornung, Oakland, Cal.
580,215.—STOVE—R. P. McKay, Portland, Or.
580,193.—BOX COVER—Mary McRae, Everett, Wash.
580,142.—HOSE NOZZLE—Neilsen & Krauth, Alameda, Cal.
580,217.—HOT AIR CABINET—W. H. Peirce, S. F.
580,226.—PIPE TUNNEL—E. F. Sanford, Merced, Cal.
580,229.—FRUIT SLICER—S. H. Shelley, Berryessa, Cal
580,232.—HARNESS HANGER—E. P. Smith, S. F.
580,073.—WAVE POWER—Williams & Tuller, S. F.
580,030.—CONCENTRATOR—Geo. E. Woodbury, S. F

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT SLICING MACHINE.—S. H. Shelley, Berryessa, Cal. No. 580,229. Dated April 6, 1897. This invention relates to a machine which is especially designed to slice fruit, preparatory to its being canned, dried, preserved, or put up in other ways. It consists essentially of a series of rotary cutters, the blades of which stand in radial planes, so that the edges of the cutters converge and stand closely together; a mechanism by which each of the cutters is rotated in its plane; a means for passing the fruit beneath and between the converging edges of the cutters, and a yielding surface beneath the cutters for receiving the fruit and holding it up into contact with the cutters as it passes. In conjunction with the carrier upon which the fruit is conveyed is an intermediate carrier extending between the main ones and slightly above the level thereof, whereby the central portion of the fruit is prevented from sinking between the main carriers.

SUBAQUEOUS PIPE-TUNNELS.—Edgar F. Sanford, Merced, Cal. No. 580,226. Dated April 6, 1897. This invention relates to the class of pipe-tunnels or conduits for any purpose, such the conveying of liquids or gases, or the transportation of messages and goods, or the passage of vehicles, such tunnels being laid under water to rest upon or in the bottom. It consists essentially of flexibly jointed sections; a continuous flexible line secured to each section and crossing the joint so as to connect them together; coupling sections telescoped in the adjacent ends of the main section, and of sufficiently smaller diameter to permit the main sections to bend out of line; bands of flexible waterproof material encircling the joints exteriorly, and fastenings on the main sections consisting of fixed and movable jaws which engage the continuous cable which flexibly connects the sections together. In conjunction with these are controllable nozzles in each section with pipes leading thereto, whereby water may be introduced and ejected against the bottom so as to adjust and grade the line of the tunnel or conduit.

TOUCH REGULATOR FOR KEYED INSTRUMENTS. Rudolph F. Hornung, Oakland, Cal. No. 580,282. Dated April 6, 1897. This invention relates to a novel means for arranging and mounting the touch-regulating mechanism, to cause it to exert varying degrees of pressure and vary the touch of the keys to suit individual performers. It consists essentially in the combination of a pivotally mounted bar; a series of coiled springs secured thereto, having their free ends so disposed as to contact with a part of the action of the instrument; a crank arm depending from the pivot bar; a rachet bar having side flanges provided with inturned lower edges, and a rod connected with the crank arm, having a pawl at its free end adapted to engage the rachet bar and to slide freely between the side flanges. By means of an interposed rocking bar the pawl may be moved with relation to the ratchet so as to increase or decrease the tension of the springs.

COLLAPSIBLE TELESCOPIC HOT AIR CABINET. Wm. H. Pierce, San Francisco, Cal. No. 580,217. Dated April 6, 1897. This invention relates to an adjustable cabinet which is specially designed for the purpose of hot-air bathing and treating. The object is to provide a cabinet which may be made to form an enclosed chamber within which the person is seated for the purpose of applying a hot-air bath, the chamber being adjustable for different heights, and made to be taken to pieces and folded up by means of telescoping framework. It consists essentially of tubular corner posts, other corner posts adapted to be slidably fitted to the first named ones, means connected with one set of posts engaging with the posts of the other set to vertically adjust the height of the cabinet, sockets on the stationary posts and transverse connecting bars having their opposite ends bent to detachably engage said sockets, an exterior flexible covering for the cabinet and devices for securing the corners or angles to both sets of corner posts, said covering having a neck opening and a flexible front with means for closing and uniting the same.

ADJUSTABLE STAIRWAYS AND FIRE ESCAPES.—G. H. Dyer, San Francisco, Cal. No. 580,262. Dated April 6, 1897. This invention relates to improvements in stairways whereby the direction of the exit and entrance at the opposite ends may be regulated to suit the points where the landings are located. The object is also to provide a simple and easily adjustable means for building spiral and other stairs without any necessity of laying out each set of stairs to suit the particular location. It consists essentially of a step support with collars and means whereby they are adjustably clamped upon the support, said collars having supporting lugs, segmental tread plates having horizontal, flat-faced inner ends fitting and secured upon the lugs and standards by which the outer ends of the steps are adjustably connected and supported. The peripheries of the steps have a series of perforations so that the standards may be connected with two or more steps and secured thereto.

MINING DREDGING APPARATUS.—Peter J. Gildea, San Francisco, Cal. No. 580,269. Dated April 6, 1807. This invention relates to that class of dredgers in which a suction pump is employed to raise the material. It is especially designed to be used in mining operations to raise to the surface material from which the precious metals may be separated or extracted, and has for its object a means for stirring and loosening up the material at the bottom, at the same time preventing the clogging up of the suction pipe. The screen chamber enclosing the mouth of the suction pipe has holes in the lower side and reciprocating pieces operating through the holes to keep them clear; these pieces also projecting, so that they are adapted to loosen up the material beneath. The screen box is rotated so that the longitudinally slidable rods are moved in and out through the holes in it, and a means operated by the rotation of the exterior pipe and box which acts to move or reciprocate the said rods. In order to dispose of the larger rocks and pieces, I employ an endless traveling carrier with teeth and guide extensions, which act to carry away these larger rocks or pieces. The tank forms a part of the suction channel having communication therewith and a screen, so that the material is separated from the water by said screen and falls into a receiving box beneath.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

PELATAN-CLERICI PROCESS.

Patented in U. S. and Other Countries. Capital, £100,000.

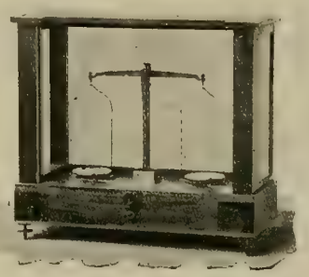
London Head Office.....8 Drapers Gardens.

Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.



HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
